The two-wheeled, dirty, skiddy, loathsome abortions—to mention a few of the adjectives, etc., used by this epicurean motor cyclist—will die the death. Fortunately, the motor bicycle is anything but the black thing he paints it, and my friend's remarks may be attributed to a mind diseased, due to his having been luxuriating in an up-to-date high-powered limousine car, watching someone else do the driving and other work. He *is* like that. Nevertheless, I fancied I detected a gleam of sanity when he said with absolute conviction, "This (1912) is the last year of the single-cylinder. The twin is coming." And I wondered. Changes are undoubtedly pending, and whilst manufacturers of single-cylinder engines are increasing, and singles of large capacity are not now uncommon, there is an under-current of desire for a more uniform torque, and smoother action generally.

Why the Demand has arisen.

There is not the slightest doubt that this coming, in fact this present demand, is largely due to the inferior design of many single-cylinder engines, slavish copying of outline with ignorance of principles, and in other directions making every desideratum subservient to the demand for efficiency, power, and compactness. The result is seen in the tale of transmission and tyre troubles, the demand for expensive speed gears, and the call for more cylinders, to which the man in the street lends his voice, imagining a crowd of little evils better to be chosen than one great one.

The T.T. Races and various Brooklands events go to confirm his opinion, because in these he sees the result of greater power and not necessarily higher efficiency, as he imagines. His call must, however, be heard, and whether it will be answered by the multiplying of cylinders, or a correction of inferior design in the single, remains to be seen; doubtless, as with most things, it will be a case of the survival of the fittest, but fitness in this case will be measured not alone by depth of pocket, and length of patience, necessitated by the greater cost and tuning needs of the multi-cylinder, but by the demands of utility and circumstance.

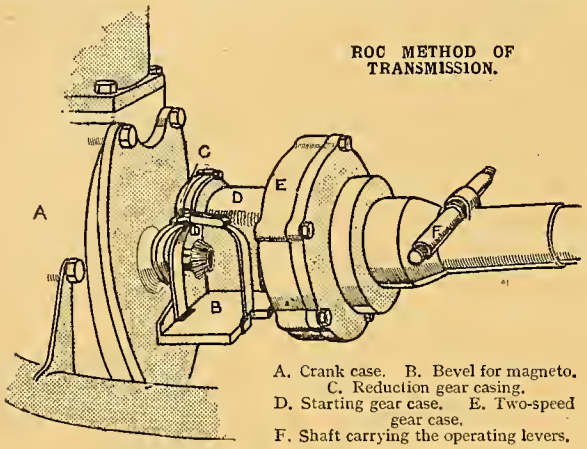
Were fitness to be decided by efficiency alone, the single-cylinder would remain the monarch of motor cycles, for an increase of cylinder dimensions within an extremely wide range has shown an increase of thermal efficiency, and in the larger engines higher mechanical efficiency.

A well-designed single with correctly-shaped and dimensioned valves and ports is one of the most efficient power producers known, and possibly always will be. In the future it may be made to run so smoothly, and with so even a torque compared with the average motor cycle engine of to-day, that the rider and machine need suffer no detriment and realise no disadvantage in its employment.

Bearing this in mind, one wonders if there is any real *need* for multi-cylinder engines, and if the demand for luxurious riding would not be more wisely provided for, by improvement of the single with its efficient simplicity, than by the multiplication of parts, with the additional cost and complication. But there will always be those to whom luxury appeals more than any other feature, and they will say: "If a correctly designed single-cylinder will give us so large a measure of our requirements, would not a similarly well designed twin do better still?" and we have to answer that in many respects it would. Although losing in simplicity, and in both thermal and mechanical efficiency, yet the twin will lend itself to a greater power development for several reasons. As power will be transmitted with less shock, lighter frame parts may be used, lighter transmission and speed gears, and possibly a lesser call upon the nerve forces of the rider, owing to the smaller waves of vibration.

Another Aspect of Chain v. Belt Drive.

I am reminded of two machines identical in every respect save transmission—one was belt, the other chain drive through a clutch. It was absolutely impossible to *feel* any difference in the machines, but a run of 100 miles with the chain drive fatigued one as much as a far greater distance on the belt-driven machine. I could only attribute this to the unrealised tremor or vibration caused by the chain links striking the teeth, affecting super-sensitive nerves. The heavier reciprocating parts of the single, not forgetting the larger valves, stronger springs, etc., all more or less unbalanced (although possibly unrealised), will tell their tale of vibration to a greater extent than the smooth running twin which should, therefore, be less fatiguing. This, of course, merely from a comparative standpoint, the fatiguing effects due to vibration of a modern engine usually being negligible.



The smooth running twin will therefore be less fatiguing, although developing more power than a single of equal capacity. The bearings of a twin will have a longer life, but the engine will not maintain its tune so well.

In spite of the drawbacks one is bound to conclude that the smooth humming glide of the 500 c.c. twin will be heard in the land. 1913 will see many on the road, but for purely utility purposes it will not, in my opinion, oust the single for many years to come.

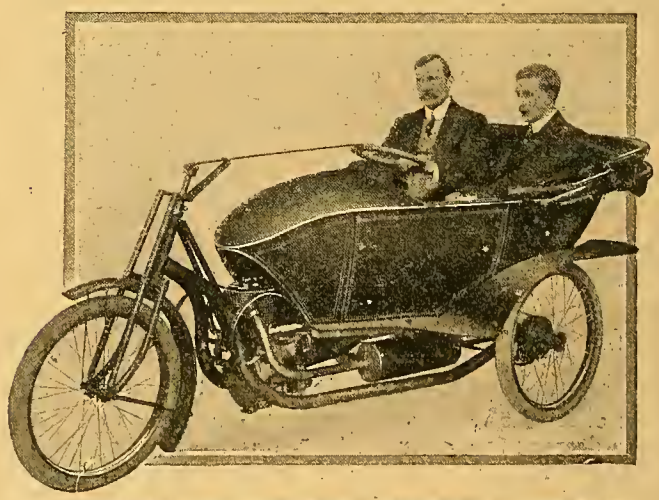
A Run on the Roc Tricycle.

WE recently spent a most interesting morning in the Roc works and on the road in the latest pattern tricycle made by this firm.

Mr. A. W. Wall is a great believer in something more than a motor cycle and less than a car, but

ROC METHOD OF TRANSMISSION.

A. Crank case. B. Bevel for magneto. C. Reduction gear casing. D. Starting gear case. E. Two-speed gear case. F. Shaft carrying the operating levers.



insists on the necessity of two driving wheels and a differential gear. As the tricycle stands in its present redesigned form, it is a neat and light device on quite unusual lines.

The frame consists of two large diameter tubes swept downwards from a heavy motor cycle type steering head and fixed rigidly to the rear axle sleeves; two stout tie-rods, or rather tubes, slope backwards and downward from the top of the head to a cross member.

The engine, which has a bore and stroke of 90 × 96 mm., is held rigidly in the frame from four points, and carries at the back an aluminium casting which forms a casing containing a spur gear reduction from crankshaft to counter-shaft, a geared up bevel starting device, and a two-speed gear similar to the Roc motor cycle gear, giving a 40% reduction on the low; besides this, the casing carries the magneto, which is bevel driven from the crankshaft. The whole forms a neat and substantial power unit. From the gear box a propeller-shaft conveys the power to the rear live axle by means of bevel gears and a differential of the spur type. The propeller-shaft is enclosed in a rigid tube, which acts as an additional frame stay and does away with the necessity of universal joints. The front forks are of the motor cycle type, but extra strong, and steering is accomplished by means of a long flat steel tiller, which absorbs road vibration. On this chassis is a comfortable two-seated egg-shaped body slung on long laminated springs.

On the road we found the machine steady in grease and particularly well sprung. The engine seemed to have plenty of power, and the foot control made traffic driving a pleasure, while the brakes, which are of the band type on the rear hubs, are powerful and smooth in action.

We found all control levers come conveniently to the right hand, and the exhaust lift arranged so as to be gripped by the left hand, while the starting handle is revolved from outside by the right hand. The body is comfortable, and silence is a feature throughout. In all these points there is evidence of forethought and careful experiment.

The redesigned Roc tricycle, which has an air cooled engine and is gear driven.

The Motor Cycle in Germany and Austria.

AS yet, notwithstanding reports to the contrary, there is little or no evidence of the likelihood of an early revival of the motor cycling sport in Germany. The Berlin movement, to which we recently referred is, at best, but significant of a desire to raise the sport from the low level to which it has fallen by degrees.

One of the few definite programmes for infusing life into German motor cycling has been formulated by the Magdeberg branch of the German Cycling Federation, whose chief interest, we may point out, centres on the push-bicycle. The branch invites its motor cycling members to a mileage competition between March 1st and the second Sunday in September, both dates inclusive. Competitive touring is, however, restricted to Sundays and public holidays, and competitors must bind themselves to cover at least 1,250 miles (2,000 kilometres) They will receive charts and checking cards from the branch's touring superintendent.

Austrian Club's Programme.

Turning to Austria, we note a greater activity, the Allgemeine Motorfahrerverband, whose headquarters are in Vienna, having already drawn up an interesting programme, including the following four meetings.

May 26th.—International hill-climb on the Riederberghöhe, open to racing and touring machines.

June 2nd.—Races on the St. Pölten trotting course.

June 30th.—Races in the Neuenkirchner Allee.

July 14th.—Reliability run, round the Semmering.

The season will probably terminate with a competition on the Semmering itself, somewhere about the middle of September. This hill, by reason of its length, tortuousness, and steepness, affords plenty of scope for expert and daring riding.

Occasional Comment

Cost of Running a Motor Cycle.

I have received a number of frenzied protests from various readers against the estimates of motor cycling expenses perpetrated by a contributor to a Sunday newspaper, who admits he has abandoned the pastime. I think the extraordinary increase of the hobby must be regarded as the most satisfactory answer to any exaggerations of normal experience. For myself I can only say that I have been a strenuous rider since the first days of the era, and that I have never been confronted by a single large bill, other than the invoice for the machine itself. On the rare occasions when some defect of design or workmanship has necessitated extensive repairs, the cost has invariably come under the makers' guarantee, and I have jogged along very comfortably from week to week and from year to year.

The normal expenditure of the average motor bicyclist consists of frequent small disbursements for petrol and oil, at the rate of about one shilling and threepence a hundred miles for the former, and of sixpence to eightpence a hundred miles for oil. Once a month or so the purchase of a new valve or a new sparking plug must be faced, which implies an outlay of about three to five shillings; and once in each season the tourist requires a new belt, say a guinea, or a new cover, say £2. Except in rare instances other expenses are due to the fault or fancy of the rider. A reckless man will open his throttle on a tempting stretch in a police-harried county, or round a blind corner too quickly; a helpless man will have recourse to the repairer for every puncture or leaky valve or loss of a hundred engine revolutions. The resultant fees must be debited not to the sport as a sport, but to the individual as an individual.

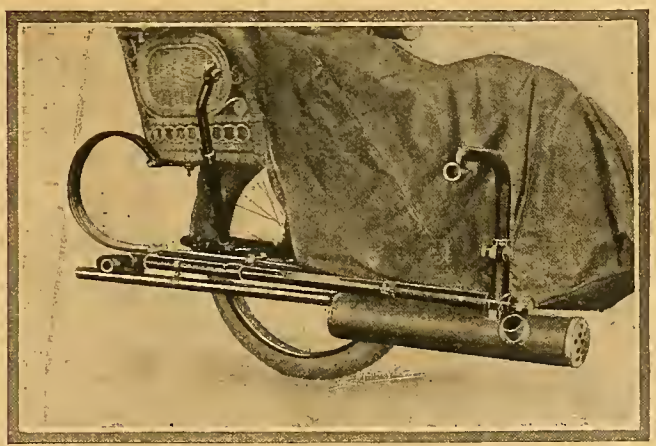
The Commissariat Department.

Personally, like the majority of my riding acquaintances, I have avoided accidents, fines, and long lists of items on a garage billhead. The heaviest expenses I have incurred as a motor cyclist are due to my personal idiosyncrasies, and have been deliberate extravagances. I dislike scratch meals. Some men get through a double century run on a packet of home-made sandwiches and a flask of liquor from the domestic cupboard. I detest dry and crumbly sandwiches and lukewarm drinks; when I am on the road, I time my route to approach excellent hostelries in the neighbourhood of meal times, and foot the resultant bills merrily. But I do not blame the sport; a tin flask and sandwich case would obviate this waste.

Old and New Accessories and Clothing.

Again, I loathe out-of-date accessories; I might have economised to the tune of a small fortune by retaining an excellent Schmidt lamp and B.K. horn, which I bought about 1903; both are still in use, and have cost little in repairs. But I sold them with my 1903 machine, and most seasons since have seen the purchase of at least a brace of hooters and lamps. Gross extravagance, I admit; but I do not blame the sport.

I am always seeing something new in clothing, and spend pounds every year on new gloves, leggings, and coats; but there still hang in my garage the crude but serviceable garments I bought a long while ago.

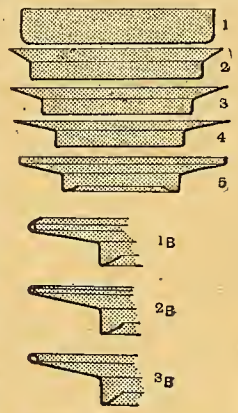


Sometimes, too, when the weather is bad and I am in a lazy mood, or the initial portion of my route lies over roads I know and loathe, I travel part of the way by train. Again I do not blame the sport. The inevitable expenses imposed on me compulsorily by my adoption of motor cycling as my pet hobby have never totted up to anything like ten shillings a week, even though I distribute them only over the four months of the summer season.

Once a Motor Cyclist Always a Motor Cyclist.

I should not have the least hesitation in remaining a motor cyclist if Mr. Lloyd George taxed my income down till I had but a humble dollar a week for spending money; though I admit I should then be a less frequent figure at hotels, retain my accessories as long as they would hold together, wear somewhat weather-beaten toggery, and absolutely eschew the railway train. The essential and inevitable expenses of motor cycling are ridiculously small for anybody who does not regard every outing and every hobby as a fresh opening for lavish personal expenditure in sidelines; and this is true even of the amateur novice, who may have to acquire a little rudimentary mechanical knowledge before he can rank as independent of the repair shop.

I started on the hobby as that particular brand of idiot who uses a hammer on an ordinary wood screw, and never remembers which way a gas tap turns on or off. There were no handbooks available, and machines were very, very bad. But after I had once seen a mechanic grind a valve or adjust a trembler, I began to do my own repairs; and to-day—apart from machine tools—I flatter myself I know more about motor cycle repairs than 999 out of every 1,000 garage mechanics.



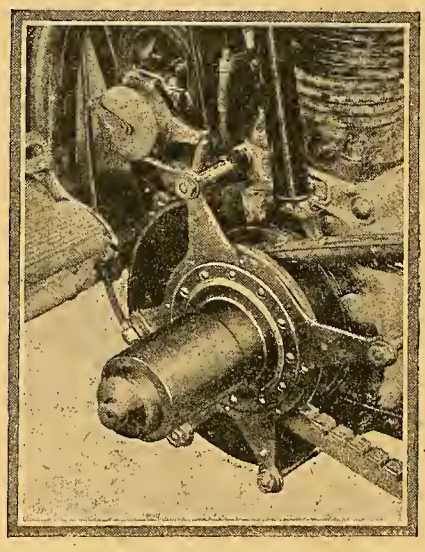
This knowledge has been earned on the road, and I do not regret one moment of the delays in which I acquired it, though some of them were very long.

A suggestion of *The Motor Cycle* is being adopted in several quarters. To silence effectively a motor bicycle is difficult owing to lack of space for a large silencer, but with sidecar machines a large box can be attached to the sidecar frame as shown. The Rudge Co. are now trying the idea.

How a Variable Gear is Made.

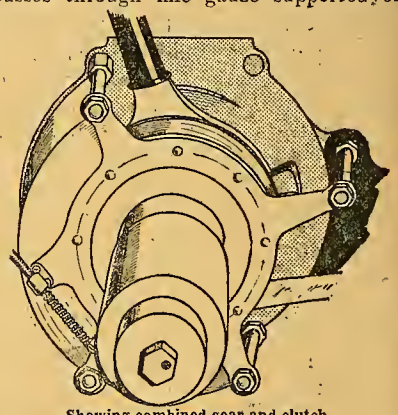
RECENTLY we spent an instructive morning, studying the manufacture and assembling of the different parts of the Rudge variable gear, a modified design of which has recently made its appearance. One of the most interesting processes is the pressing of the divided rear pulley or belt rim. The two separate halves are pressed from flat circular plates of steel. The plate for the outer or loose flange undergoes five pressing operations to bring it to the correct size and shape, and three more to wire the edge for strengthening purposes. The operations can be easily followed by reference to the accompanying line drawings.

Rudge belt rim pressing showing various stages of operation.



The first process brings the flat plate to a cup shape as in fig. 1. Next the cup is reduced in diameter, and the flange is begun (fig. 2). The next two pairs of dies bring the flange to a more correct angle and further reduce the diameter of the cup (figs. 3 and 4), while the final operation finishes the angle of the pulley, and turns over both inner and outer edges and cuts out the centre. After this the drum is put in a lathe and the edges cleaned up. Then begins the wiring. A wire ring is placed inside the larger of the turned-up edges, and three more presses finish the wiring by turning over this edge (as in figs. 1, 2, and 3b).

The inner or fixed flange is made in a similar fashion, but needs fewer operations. When both flanges are finished, the inner one is spoked to the wheel rim and the outer is spoked to a secondary hub, which lies outside the wheel hub, and which is capable of being slid laterally.



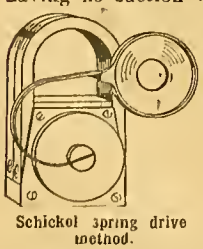
The Gear and Clutch.

Passing now to the combined expanding engine pulley and clutch, the first thing to strike one is the complete mud-guarding of the device. The ample ball thrusts are protected by rings which project over the outer edges of the pulley flanges, and the belt and pulley are shielded by a sheet-steel case extending half round the pulley. It was discovered, however, that the belt carried in a certain amount of mud, consequently louvres were cut in the front of the shield to allow dirt to be thrown out by centrifugal force, without permitting any to enter from outside.

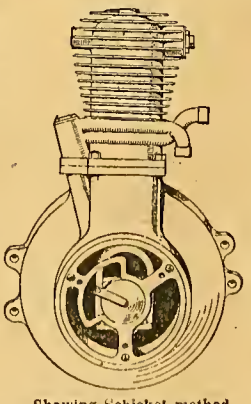
The lubrication also is very ingenious,

The new Rudge variable gear which has been rendered neater and smaller.

the oily vapour from the crank case passing down the hollow crank spindle and out through carefully positioned holes to the ball races and clutch plates, while provision is made for external oiling should it be considered advisable. Before escaping to the air, the vapour passes through fine gauze supported on



Showing combined gear and clutch.



a disc of perforated tin, which catches the oil and prevents the ingress of mud. It is most fascinating to watch the assembling of the pulley and clutch. The "truth" of the pulley flanges with the central member is ensured by their being erected on a special mandrel, which can only be withdrawn in the case of an accurate fit.

The clutch is operated by a lever on the left handle-bar through the medium of a Bowden cable, while the gears are operated by a long lever working in a quadrant attached at a convenient position on the tank. The lever expands the front pulley by means of cams, and at the same time contracts the rear pulley, or *vice versa*; by this means the belt is always kept at the same tension and the pulleys are always in line. The whole construction is carefully carried out, all necessary parts being hardened and ground.

A NOVEL MAGNETO DRIVE.

We described and illustrated on January 11th, page 46, a very interesting two-stroke motor cycle engine called the Schickel; we now illustrate the novel magneto drive on this engine. The engine is of the three-port type—having no suction valve—and has a bore and stroke of 3⅛in., the rating being 5 h.p. The inlet and exhaust ports and transfer pipe are all cast with the cylinder, and arranged so that the inlet gas is vaporised by the heat of the exhaust pipe. The magneto is carried in an extension of the crank case, and is advanced by rocking the whole magneto inside the case: it is driven direct from the crank pin through an ingenious spring drive. The lubrication is carried out by measuring a certain quantity of oil into the petrol tank and allowing it to feed in through the carburetter. We hear also that this lubrication has been found quite successful owing to the construction of the engine. The engine is carried in a neat but strong frame, in which there are no top tubes, their place being taken by a cast aluminium tank, with which are cast the lugs for the steering head, down tube, and seat post.

Schickel spring drive method.

Showing Schickel method of carrying the magneto in extension of crank chamber.

TRIAL OF A M.R. CLUTCH

In our issue of the 15th ult. we made reference to a multiple disc hub clutch fitted to the Moto-Rêve. We had an opportunity of testing one of these clutches the other evening; and must say that it impressed us most favourably. The twenty-four clutch plates are contained in the hub of the belt rim, making a very neat fitting. The extra weight involved is but 9 lbs. Although the engine is a small one, the drive is taken up quite smoothly, and the clutch started an eleven stone rider from standstill without difficulty. The clutch is operated by means of a lever on the handle-bar. The makers inform us that the complete weight of the machine with clutch is only 80 lbs.

MILITARY MOTOR CYCLING NOTES

By "CELERITER"

I STATED in previous notes that every cyclist battalion in the Territorial Army had been given authority to enlist one motor cyclist officer and seventeen motor cyclists under special conditions. It now appears that only certain battalions were given this permission, which will not become general until April 1st next, therefore those motor cyclists who wish to avail themselves of the excellent terms offered should wait until March has run its course before they apply to the cyclist battalions to be enrolled under the new conditions.

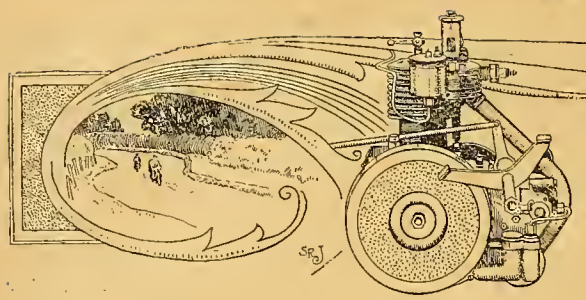
War Office Lethargy.

Some four years ago a committee was formed to consider the best means of assisting the War Office to form a corps or register of motor cyclists who would be willing to serve their country in the event of war. Captain A. H. Trapmann was co-opted a member of this committee, and in due course the results of its labours were laid before the War Office and were duly pigeon-holed. A few months later Captain Trapmann drew up a scheme on similar lines and sent it to the War Office, also to be pigeon-holed. It was calculated that for an expenditure of £2,000 a year 500 motor cyclists could be organised, equipped, and trained to their duties in the field. The next move was Lord Haldane's announcement of the intended formation of the "Technical Reserve," which scheme never got beyond the announcement stage, and did not propose to do anything more than register the names and addresses of those who owned motor cycles and would be willing to serve their country in an emergency. Latterly, a committee has been sitting at the War Office to consider the matter, but although eighteen months have been devoted to this laudable purpose, neither the committee nor the considerations have got any "forrader," and motor cyclists are still freezing in the outer atmosphere of military neglect.

The National Association of Cyclist Defenders.

Then early in January the N.A.C.D. sprang into existence, and latterly it has been announced that Captain Trapmann has consented to act as honorary secretary, so one feels very much like exclaiming, "Here we are again!" Verily, there are more ways of making an engine work than tickling the carburetter.

The object of the N.A.C.D. is to form corps of twenty-five cyclists all over the kingdom. Some of these corps (London, Coventry, Liverpool, Manchester, and Glasgow) will be composed entirely of motor cyclists; in less populous centres corps will be mixed. Members register their names and addresses and engage to come out and serve their country in the case of invasion, but in order to render members capable of doing useful service in such an emergency they will have opportunities in peace time of learning their duties, of attending lectures on scouting, demolitions, despatch riding, etc., and of working occasionally in conjunction with the military, more especially with the cyclist battalions of the Territorial Army, and with the regulars at manœuvres. It seems to be just the very scheme that was wanted by most of us, and one that motor cyclists in general will be glad to support until the War Office sweeps out its pigeon holes and gives us something better. Perhaps now that it has been put on its mettle it may make an effort. In the meanwhile, motor cyclists are joining the N.A.C.D. at the rate of several dozens a week.



Motor Cyclists in the Territorial Army.

It is rumoured that somewhere about Easter time an attempt will be made to summon a vast mobilisation of motor cyclist members, and thus to demonstrate to the authorities not only the mobility of the motor cyclist, but the advantages of the new organisation.

Also there is very good reason to believe that only those motor cyclists who actually belong to the Territorial Army, or to some recognised branch thereof, will be invited to volunteer, and if I may venture into the realms of prophecy I would venture to state that the newly-formed N.A.C.D. will be asked to furnish all the motor cyclists required by the military authorities who cannot be supplied by the Territorial Cyclist Battalions. The obvious advice to motor cyclists who wish to take part is to join one or the other of these institutions at an early date.

Lance Corporal J. W. Watt, who believes that he was the first military motor cyclist in Scotland. Last year he was attached to the 1st Highland Div. Tel. Co., R.E.T. Aberdeen, and camped at Monkton, Ayrshire.

Hydrogen Peroxide in Acetylene Generators.

By FRANK HARVEY.

THE article on the use of hydrogen peroxide in acetylene generators which appeared in the issue of January 25th, although interesting, was limited, due no doubt to a misconception of facts on the part of the author. When this application of hydrogen peroxide was first suggested it seemed to open up a great many possibilities, but a little logical thought on the physical and chemical properties of hydrogen peroxide and commercial carbide will convince anyone that the possibilities are very limited.

The properties of hydrogen peroxide were ably shown by Mr. A. Renfred Myhill in the aforementioned article, and he emphasises the absolute instability of this substance, even of very weak solutions, and it might be added that even shaking under certain circumstances will produce decomposition. This being so any solution of hydrogen peroxide placed in a generator on such a vibrating body as a motor cycle or car will be, to a great extent, decomposed into water and oxygen, the latter escaping by the air vent placed in the top of the generator, and so the conclusion is that if there be any advantage in its use it will only be initial and not lasting. This is only one of the many instances which go to prove its instability and its unsuitability for generator work.

The Purifying Effect.

But supposing for the sake of argument hydrogen peroxide were stable and could be used for any length of time retaining its strength to the last, the strength of solution suggested by Mr. Myhill is so small that the amount of available oxygen would be negligible even if extraneous circumstances could be excluded. The acetylene burner the author experimented with passes approximately 14 litres per hour, and the water consumed was about 12 c.c. per hour. Now the suggested strength, 2 ounces of hydrogen peroxide (20 vols.) to 1 pint of water, is a 10% solution. Now 20 vols. hydrogen peroxide, being interpreted, means that one volume will give 20 volumes of oxygen, or one volume of a 10% solution will give two volumes of oxygen. That is, for every 14 litres or 14,000 c.c. acetylene there will be 24 c.c. oxygen, or to put it briefly, .17% of the gas would be oxygen. This quantity is very small, and is not likely to have any material effect on the candle-power of the light by directly aiding its combustion as suggested by Mr. Myhill. "But, how is the candle-power affected as shown by Mr. Myhill's curves?" one will ask. These curves are practically valueless, for apparently the necessary precautions were not taken to ensure, what is absolutely essential for a comparison of that description, that the consumptions and the pressures at the burner were identical. However, the addition of hydrogen peroxide would have the effect of raising the candle-power owing to its purifying effect on the gas. Commercial carbide contains many impurities, both inorganic and organic, which when acted on by water are given off with the acetylene. Amongst these impurities are compounds of sulphur and phosphorus. Sulphuretted hydrogen is the chief of these, and has a great affinity for oxygen, and so any oxygen which the hydrogen peroxide will give up is used up in what is termed "oxidising" this impurity. One of the substances formed by this oxidation of impurities is sulphuric acid, which will and does readily attack the metal container, and one which the author has shows distinct signs of corrosion.

To Obtain the Best Light.

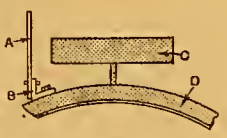
The chief points for consideration in endeavouring to obtain the maximum candle-power are—

1. Purity of the acetylene evolved.
2. Pressure of the gas at the burner.
3. Design of burner and lamp.

Acetylene may be purified by the above method, but for reasons stated it is undesirable. The method the author would suggest is to have a separate chamber made of a non-corrosive material and fill it with small lumps of pumice or Kieselguhr soaked with chromic acid or an acid solution of cuprous chloride. The gas is passed through this and thence to the burner.

The pressure of the gas at the burner has a very great effect on the candle-power of the light. The candle-power of any light, as Mr. Myhill demonstrated, depends on the amount of oxygen or air which is supplied to it. This is called aeration, and the aeration depends upon the pressure. It would be possible to supply acetylene at such a pressure that it would take up enough air to become non-luminous, and nearly as hot as the oxy-hydrogen blowpipe, but unfortunately acetylene is not stable at high pressures and explodes with great violence. This effect of pressure shows that a properly designed burner should give just the pressure sufficient to "inject" enough air at the burner to obtain the maximum candle-power, and this is what manufacturers aim at. Of course, this pressure depends upon the facility with which the air gets to the flame, and very often a little hole is placed in the burner near the hole from which the acetylene escapes to allow the air to be drawn in more freely. It is advisable, therefore, when buying a burner to purchase one used or recommended by the lamp makers.

Finally, the explanation given by Mr. A. Myhill, "the excess of oxygen in an acetylene light cools the flame down and so decreases the candle-power," is a misconception of fact, and the writer begs to remind him of the abnormal heat obtained from the oxy-acetylene blowpipe which gives an entirely non-luminous flame.



LETTERS TO THE EDITOR

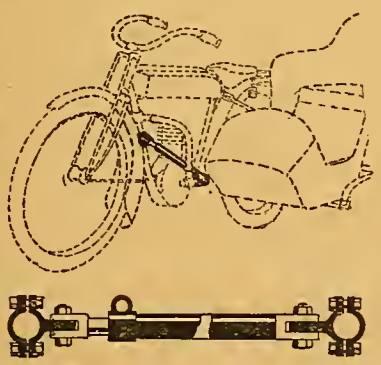
The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

How to Exhibit a Badge.

Sir,—May I offer to your readers a method of fixing a badge on their machines which is both simple and effective. All that is necessary is to drill two small holes in the extreme front of the front mudguard, and make two small brass angle plates. Fix these on the front mudguard with small pins, and touch up with paint of the same colour as the machine. The badge can then be easily fixed to the front part of the angle plates with two more small pins.

A A.A. badge.
B Brass angle plates.
C Number plate.
D Mudguard.



I have fixed my A.A. badge in this manner, and find it is out of the way, keeps fairly clean, and is most easily seen by all users of the road, even at night, as the lamp lights it up splendidly. Perhaps the enclosed rough drawing will make my meaning more clear.

THOS. E. HAMPTON.

An Auxiliary Sidecar Coupling.

Sir,—I have pleasure in submitting to you a sketch of an auxiliary sidecar coupling which I have patented No. 25027.

It consists of one steel tube telescoping into a larger steel tube, with a clip and bolt brazed on to one end to fasten the inner tube in position. Both these tubes have jaw clips brazed into one end, which couple up to other clips on the front down tube of the motor cycle and the longitudinal tube of the sidecar.

The idea of the above is to strengthen the front portion of the sidecar, and take away the swinging and sagging motion when rounding corners. It keeps the sidecar perfectly rigid.

P. H. COCKCROFT.

Experiments with Hydrogen Peroxide.

Sir,—I should be glad if I may be allowed to correct a misunderstanding which seems to have arisen out of my article on "Experiments with Hydrogen Peroxide."

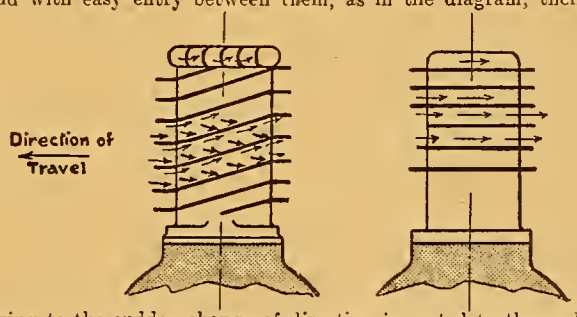
I refer to the danger of its use. Many people with whom I have conversed on the subject have expressed a desire to adopt the idea, but are afraid to do so on account of the possibility of explosion.

Let me say, once and for all, that if the proportions recommended, viz., 2 ozs. of 20 vol. H_2O_2 per pint of water are adhered to, there is *absolutely no danger whatever. An explosion under such circumstances is a physical impossibility.*

I suppose the little incident I described of a friend of mine, whose generator exploded, has been the cause of all the discussion, but this case was the result of experimenting with a solution far and away stronger than any I used or should dream of using. It is *possible* to blow the generator to pieces if you purposely *try* to do so, but I think this is the only case in which there is any fear of explosion.

I should be glad if you would call attention to this matter, as I see there are comments, not altogether favourable to me, in other periodicals besides *The Motor Cycle.*

A. RENFRED MYHILL.



Inclined Engines.

Sir,—I have noted a letter in *The Motor Cycle* signed by "Vertical," in which my name is mentioned several times, and which letter appears to have been written by a gentleman in the trade who has an axe to grind.

If he will kindly mention his name, I will endeavour to reply to his query.

W. H. WELLS.

Sir,—With reference to "Ixion's" remarks of the 8th ult., and the correspondence that has followed, on inclined engines. Casting the radiating fins on certain inclined engines parallel to the ground has always appeared to me to be wrong. If the fins are disposed horizontally, then when the machine is in motion they travel in the path of least resistance, whereas the more forcibly air is made to impinge on them the more heat will be carried away. If the fins were disposed at an angle, and with easy entry between them, as in the diagram, then,

owing to the sudden change of direction imparted to the rush of air as it entered between them, it would be kept in close contact as it traversed the fins, and thus more heat would be dissipated.

With the usual arrangement practically only such heat as is actually radiated is swept away, and in many engines the radiating surfaces are not developed sufficiently, hence such engines quickly store heat.

Whether the few makers who incline their engines and omit to alter the radiating fins to lie parallel to the ground in accordance with custom do so by design, or merely to simplify the pattern, can only be surmised.

MELANZIE.

[This letter was unavoidably held over.—ED.]

The Ideal Military Motor Cycle.

Sir,—"Celeriter," in his Military Notes of the 22nd ult., invites one to express an opinion as to the best type of motor cycle for use in military operations. Under item No. 1, "Celeriter" proposes that the machine should be able to go "dead slow" amongst troops. Most motor cycles to-day are capable of slow speeds, and when a speed of less than five miles per hour becomes necessary, it would be better to disengage the clutch and dismount. The order "dismount" is generally given to pedal cyclist corps when mingling with other branches of the service. When not given, the dismount more often than not occurs in-

voluntarily, or by the wily design of the foot or horse soldier—over goes the iron horse contingent into a most inartistic heap.

A motor cycle used under military authority would have at times to do very rough work; crossing over fields, through water splashes and stretches of sand, consequently a 4 h.p. machine weighing only 112 lbs., as suggested by "Celeriter," would soon be suffering from a very bad attack of the rickets. On the other hand, if the machine were of the heavy gun-waggon type, it would prove cumbersome and unwieldy with equipment attached, and be a source of delay when being removed from a place of hiding. Into a place of hiding it would have to be often placed when the rider was with any advanced party. The type of motor cycle which would perhaps be best suited for the task might answer to the following specification; the object being to have the medium article in size and weight, and for this size and weight to possess maximum strength: 3½ h.p. single or 3¾ h.p. twin engine fixed well above the ground, strong and exceptionally well sprung frame, variable gear, preferably three speeds with clutch combined, tyres 2¼in. of first quality, a carrier extra strong and capable of securely supporting the weight of an average man, no plated parts whatever, and the enamelled ones to be either dark green or khaki in colour. Last, the machine would have to be as silent as possible, otherwise anyone engaged in scouting might as well carry a powerful rattle and cry, "I'm on your track, Martin." Good soldiers should be well equipped; but good equipment does not, of itself, make good soldiers.

AUTO MILITAIRE.

Sir,—Your military contributor "Celeriter" need wait no longer for his ideal motor cycle. The two-speed Douglas just about fills his requirements. It will travel at from three to forty miles per hour, or average thirty miles per hour for hours over give and take roads; climb anything up to 1 in 4 from a standstill, tow a cyclist or a light sidecar over all but the worst hills, and weighs only a few pounds over the hundredweight he stipulates.

I am speaking from about nine months' experience of a 1911 model E, but I suppose the 1912 model K, one of which I am anxiously awaiting delivery of, is even better.

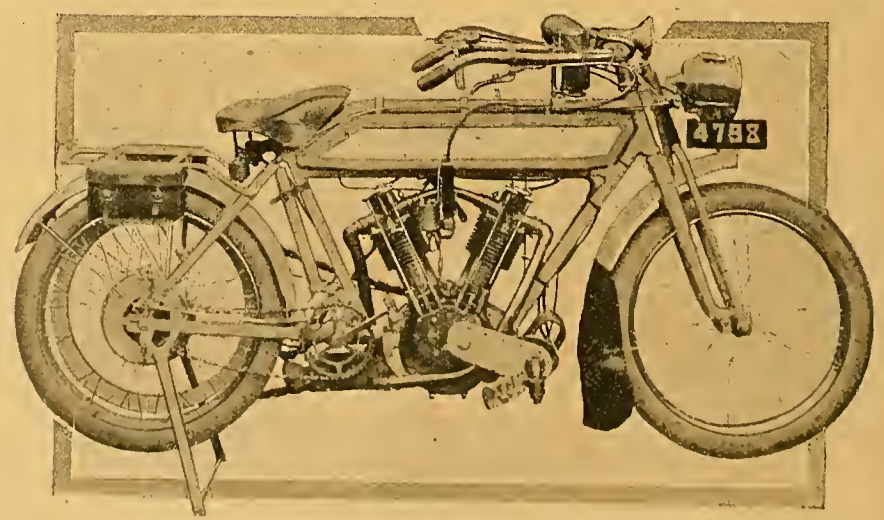
An advantage of such a mount which "Celeriter" does not mention is that it can be ridden without damage over rough surfaces where one would hesitate to take the ordinary heavyweight.

J. C. BENNETT-MITCHELL.

An Australian Engineer's Mount.

Sir,—I have been a constant reader of *The Motor Cycle* for many years, and have always thoroughly enjoyed it. Thinking you would be interested, I enclose a photograph of my new free engine two-speed gear motor cycle, which I have recently completed. In reference to the engine, the cylinders are 3in. bore by 3½in. stroke. The radiators are machined out of the solid; the body of cylinders below the radiators is machined and polished. The combustion space is larger than the bore of the cylinder; this allows of large diameter valves. The cylinder heads are detachable, and are secured to the cylinders with six studs. The undersides of the valve heads have ⅜in. diameter pins projecting. These work through a spectacle plate which is secured to the detachable heads. If the valve heads break off they cannot fall into the cylinder, as they are caught by the spectacle plate. Up to now these pins and plates have not caused pre-ignition.

The crank case is of gun metal, machined and polished; the flywheels are of cast iron; the crankshafts of cast steel (hollow), 1in. diameter; the crank pin cast steel (hollow), 1½in. diameter, hardened and ground; the main bushes are patent metal; the connecting rods are mild steel, machined out at the sides to form an H section; the big ends have phosphor bronze bearings, and the small end bearings are cast-steel hardened and ground; the gudgeon pins are of mild steel, case-hardened; the levers for working the tappet rods are fitted with rollers running on the cams; the exhaust lifts are so arranged that the back cylinder is cut out first—this is handy for traffic; the magneto is chain-driven; and the chain runs in an oil bath.



The back wheel hub is the same as is fitted to the V.S. machine; this two-speed and free engine gear has given me every satisfaction. I am using a Whittle belt for transmission top gear 3.3 to 1, low gear 6.6 to 1. The machine has two stands (the front one, not shown in the photograph, is just under the magneto), and weighs 2 cwts. My weight is 15½ stones.

The tyres were specially made by the Barnet Glass Rubber Co., having square treads ¼in. thick at the centre of the tread. The frame is of Chater-Lea parts, altered as shown. I designed and built the engine throughout.

In conclusion, I may say that it took me eighteen months to build the complete machine, which was done in spare time in my private workshop.

Wishing *The Motor Cycle* every success.

Victoria, Australia. V. E. E. GOTCH.

A special machine built by an Australian motor cyclist. (See accompanying letter.)

Hill-climbing.

Sir,—I have noticed in your journal that Mr. Frank Smith is desirous of finding a hill in England on which to test the hill-climbing powers of his Clyno and sidecar, which he almost guarantees will climb any hill in the country. May I draw his attention to a little "pimple" we have in the Isle of Wight. The hill I am referring to is Tulse Hill, Ventnor. This hill is what one might term "short and sweet," the length being a bit under the quarter of a mile, and the gradient is, I should say, about 1 in 2½. I may also add that the surface is good. This hill is said to be the shortest and steepest hill in England, and no doubt the correct length and gradient would be given Mr. Smith (if required) if he writes to the Town Surveyor of Ventnor. May I congratulate Mr. Smith on his previous records.

I.O.W.

[The Town Surveyor of Ventnor, Mr. H. Hughes Oakes, C.E., kindly informs us that the gradient of this hill is at the bottom part about 1 in 4, top part about 1 in 5. The hill is open to ordinary traffic, but little used.—Ed.]

Improvised Variable Pulley Gear.

Sir,—Perhaps the following tip concerning the Blumfield adjustable pulley would interest your readers.

Into the knob which has to be pressed in when the gear is altered a piece of steel bar should be screwed so as to project about ¼in. To the end of this piece of steel is brazed a round disc about 1in. diam. If the disc be pressed in with the foot when engine is running, the gear will be raised, and if pressed in when the exhaust valve is lifted the gear will be lowered.

Of course there are no means of taking up the slack in the belt. This comes in useful for tightening the belt when it is slipping, slow riding in towns, and picking up on hills.

ZEDEL.

Dissatisfied with English Machines. One Reason.

Sir, I read with some interest the paragraph *re* Donald Larke headed "Dissatisfied with English Machines." I also noted your remark thereon, but you might have added that Mr. Larke happens to be the agent for the Pierce motor cycle. American papers please copy.

W. F. ROGERS.

The Dust Nuisance.

Sir,—I shall be glad to know if any of your readers can suggest any means of preventing dust being thrown up by the back wheel. It may seem rather early yet to worry about dust, but it will soon be due. My experience of motor cycling is that it is much easier to keep oneself in a presentable state in winter than it is in summer. I ride a 1911 Triumph, and do not want a better mount; but I should like to be able to go for a spin in the summer without knowing that by the time I had done twenty miles my face and the back of my head would be in an awful state of dust.

I feel sure that the dust must be thrown up by the back wheel. Are there not any means of preventing this? If you would be so good as to insert this letter, perhaps a discussion on the subject may lead to some remedy being found. S.H.M.

[The only remedy for dust is to treat the road surface with a suitable tar preparation. More dust thrown up by other vehicles settles on the rider than rises from his own driving wheel.—ED.]

Necessity is the Mother of Invention.

Sir,—I see in a recent issue of *The Motor Cycle*, under the above heading, that Mr. A. B. Bennett asks me what plan I would adopt to thaw a generator on a frosty night when the date of the last snowfall was some time during the previous winter. If Mr. Bennett would care to put himself in communication with me (my address is The Beeches, Bassingborn, Cambs.) I shall have great pleasure in giving him full particulars of the method employed on several occasions by me to thaw a frozen generator, and I can assure him that it has been a great success, and is very much cheaper and more efficient than thawing the generator over a petrol fire, and he need have no necessity to wait for the next snowstorm.

I have never tried Mr. J. B. Dall's method of warming the generator at the silencer when the engine is running, and I do not think that the gases coming from the silencer would have the desired effect, as I always find that the exhaust when it leaves the silencer is nearly cold, except perhaps after a long run, and even then it would be a long job to thaw the generator.

When I wrote my original letter to you I related the method I adopted a few days before. We in East Anglia had a fall of snow, but perhaps in Mr. Bennett's locality there was no snow. (Dr.) SELBY CLARE.

Three and Four-wheeled Cyclecars.

Sir,—In view of the keen interest that is now centring round the motor cycle type of passenger vehicle, the probable supremacy of the four wheeled class: as opposed to that of three wheels, is, I feel sure, a matter of vital interest to all those who have in any way studied the problem of runabout construction.

I, therefore, make no apology for this letter.

I have endeavoured to take a totally unbiassed view with regard to the relative merits of the two types of vehicle. Viewing the matter, therefore, with all impartiality, I have come to the following conclusion. That the four-wheeled vehicle weighing under 5 cwts. will obtain absolute supremacy over its rival the three-wheeled runabout.

Having made my statement I will now give my reasons.

The three-wheeled vehicle labours under the following disadvantages.

To deal firstly with the seating problem. If the two seats are placed side by side between the two front wheels the weight over the rear driving wheel is insufficient to cause efficient road adhesion, and satisfactory running under all weather conditions is impossible. If the passenger be placed in front of the driver (as in the old forecar) the aim of the machine is totally defeated, as all sociability is lost. If, on the other hand, the driver and passenger are placed one each side of the rear wheel the seating space is very restricted, and in the case of there being only the driver on board, the balance is adversely affected.

Now with regard to the mechanical side of the rear-driven three-wheeler. The first and foremost objection is inaccessibility of the rear wheel What modern car owner would be content to squat in the mud and mend a puncture in the pouring rain? The modern runabout owner is not going to be content to do so either; he is going to demand interchangeable wheels, and he is going to get them too, on the four-wheeler

Then the driving strain on the rear wheel must be abnormal. What car designer would be satisfied to transmit 8 h.p. through one 3in. tyre? Ignoring the load which it is imperative that the rear wheel should carry in order to obtain proper road adhesion, we still have conditions which determine the life of the rear tyre as being—at the best—but a short one.

Now as to the case of the four-wheeled vehicle.

By adding a wheel at the rear we obtain the following conditions—conditions absolutely indispensable where satisfactory service is to be obtained

Firstly, all four wheels are directly accessible, and, where desired, interchangeable

Secondly, both weight and driving strain are shared by two tyres, thus ensuring an increased tyre life of at least 100% over and above that of the three-wheeled vehicle.

Thirdly, the necessary road adhesion is obtained without corrupting the design by an effort to place abnormal weight over the rear wheel.

Fourthly, the stability obtained is all that can be desired. It, therefore, seems obvious that, taking everything into consideration, the services which the motor cycle type of passenger vehicle will have to give demand the provision of four wheels, and that the three-wheeled type will never quite supply the want which so clearly exists for a machine of this class.

If I have in any way over-rated the indispensability of the fourth wheel, I shall be only too glad to hear of any sufficient reasons for an alteration in my opinions.

GILBERT J. ALLDAY.

Pillion Seats.

Sir,—Referring to your illustration of a lady and gentleman on a pillion seat, I wish to say that my wife and myself took a tour from Edinburgh down to Towyn in

PILLION SEATS. A tour from Edinburgh to North Wales was undertaken by the riders depicted.

Wales, exactly in the same way as the illustration shows.

I enclose you a couple of illustrations, one showing the seat exactly as it is, and the other showing my wife on it.

The cycle is a 3½ h.p. Bradbury with a fixed gear, and took us both down there and a week's tour round the Snowdon district without any involuntary stoppage of any description. My wife says she would no more go in a sidecar on some of the roads that we traversed than fly.

CHAS. O. COX.

Multi-pole Sparking Plugs.

Sir—We would like to point out in reply to the letter from Mr. Clifford Pressland on the above subject that, whether a Lodge double-pole plug and an ordinary plug are used with a single-pole magneto, or whether two ordinary plugs are used with a double-pole magneto, the two spark gaps are "in series" in either case. We think that our diagrams in your issue of February 15th should have made this quite clear.

In winding an armature you can either "earth" one end of the secondary winding and have, say, a pressure of 100 volts positive at the other end, or you may "earth" the middle point of the winding and have 50 volts positive at one end and 50 volts negative at the other. You can also wind the armature without any "earth" connections, and then the pressure may be anything from 0 to 100 volts at either end, the actual pressure depending on the external circuit.

Of these three methods, the first is that used in a single-pole magneto, and the second and third are those used in double-pole magnetos. So far as straining the insulation is concerned there is practically no difference with armatures of similar size. To get the same spark pressure, the same amount of wire must be wound on the armature whichever method of winding is used, and there is the same amount of space available for insulation; any difference is merely in the arrangement of the insulation. Therefore if the double-pole magneto is the same size as the single-pole magneto, the strain on the insulation is no greater in the case of the single-pole magneto firing at two plugs in series than it is in the case of the double-pole magneto firing at two plugs in series.

We should like to make it quite clear that we do not wish to detract in any way from the value of the double-pole magneto, and, in fact, we have always made the Lodge coils on this double-pole principle, but nevertheless the advantage of being able to fire in two places in the cylinder simultaneously can be obtained with the ordinary single-pole magneto by using the Lodge double-pole plug; and this without there being the least danger of straining the magneto.

LODGE BROS. AND CO.

A.C.U. and M.C.P.A. Committees.

Sir,—The paragraph on page 225 in your last issue prompts me to ask the favour of your wide circulation in order to acquaint members of the A.C.U. with the present position of affairs concerning the General Committee. One of the early members of the Union—then called the Auto Cycle Club—I have served upon the committee for several years, and always endeavoured to jealously guard the interests of private owners, as have also other practical motor cyclists representing individual members and affiliated clubs. But during the past four years the trade element, small at first, has increased to an extent which now threatens the future welfare of the A.C.U. as the governing body of the sport. Some of these gentlemen are connected with the Manufacturers' Union, and should that organisation ever differ from the A.C.U. upon some important policy, it is a natural expectation that all trade members would hold together in committee and out-vote the delegates who have no axes to grind.

The self-constituted "progressives' committee" announce that they wish to reform the policy of the A.C.U. and bring in to the fold a large accession of members—an ingenuous statement seemingly drafted to mask other intentions. Because of log-rolling that had reached beyond reasonable limits, a tacit understanding was come to amongst the private owners on the committee that the trade element ought to be excluded from the Competitions Sub-committee, and was put into practice for 1910 and 1911; is it only a coincidence that some of the "excluded" are the moving spirits starting the wrongly-named "progressives'" campaign? The intention is more clearly revealed by the two lists of names recommended as suitable men respectively to represent individual members and affiliated clubs.

You, sir, have directed attention to the fact that the list for individual members includes seven gentlemen actively engaged in the motor cycle trade and three indirectly interested. Perusal of the list for affiliated club delegates is also worth consideration, for of the eighteen names five are actively engaged in some section of the trade, five are indirectly interested, five are private owners, but the standing of the remaining three is not known to the writer. Therefore, I deduce that the thirty suggested names comprise twelve actively engaged in the trade, eight indirectly interested, seven private owners, and three whom I cannot place. Comment is needless.

It has been charged against myself and others of my way of thinking (who for years have spent much time with the sole object of making the A.C.U. a truly influential organisation) that we are not practical motor cyclists. If by practical is meant taking part in hill-climbs and speed contests, I must plead guilty and be placed in the same category with my friends on the committee who ride machines for pleasure, but we drove motor bicycles before some of our critics had left school.

Were the Manufacturers' Union not in existence I could not dissent from the view that help from many members of the trade would be a useful asset to an A.C.U. committee; but the amicable arrangements entered into between the manufacturers and the A.C.U., for joint conferences upon matters in which the trade is concerned, at once disposes of that contention. The recent meeting of men officially representing both bodies, who mutually drafted the rules for the one day and six days' trials, proves that the responsible leaders of the trade are quite satisfied. Through their own organisation members of the motor cycle industry possess adequate means for full expression of opinion, and, backed by that influence, such desires will, I hope, always carry the weight they deserve with the A.C.U. No private owner would dare suggest that he is entitled to be represented upon the trade body or to vote in committee whilst he has his own recognised association also to render assistance.

The only means of communicating with the individual members of the A.C.U. is through the medium of the Press. If their important interests are to be respected, it is essential they should attend the annual general meeting to be held this (Thursday) evening at eight o'clock at the R.A.C. Buildings, 89, Pall Mall, London, S.W.

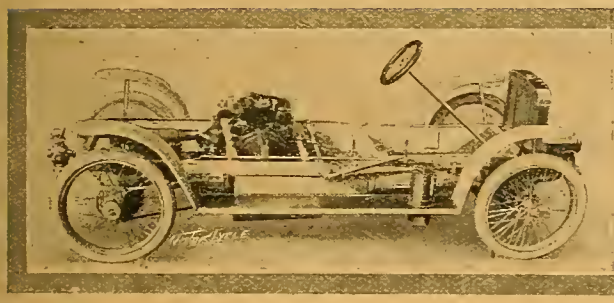
H. P. E. HARDING, a Vice-chairman of the A.C.U.

Sir,—In the report of the Progressives' meetings, I notice that the chairman stated "it would take steps to suppress bad manners at public gatherings." Excellent in theory, but in practice not adopted, for this "body" must be hard pressed for good men, when it includes upon its recommended lists the names of the ringleaders who created disturbances at two public dinners in London a few weeks ago. *The Motor Cycle* commented strongly upon the conduct of these men a week afterwards.

INDIVIDUAL MEMBER.

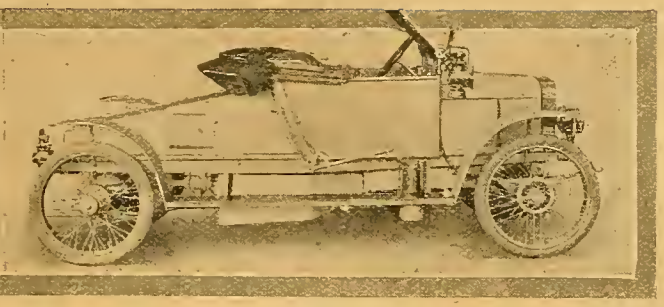
[If this be the case, surely it is a good move to have the exuberant members on the committee with a view to persuading them to exhaust their superfluous energies in keeping general order.—Ed.]

SUMMARY OF CORRESPONDENCE.



Mr. F. W. Finnemore writes: "I rode a Veloce with two-speed gear in the Sutton Coldfield Trials. Owing to the breakage of a ball race, I was unable to complete the course."

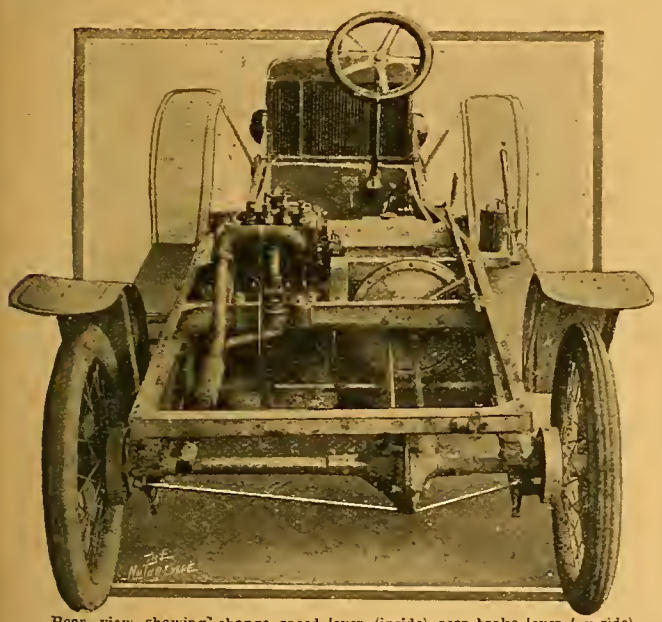
The Rom Tyre and Rubber Co. (1909), Ltd., write. "In your last issue we notice 'Ixion's' remarks in regard to tyres, 'Nothing gives quite as high a security factor as steel on the worst type of grease, but steel studs strain the fabric casing and cause undue sideslips on smooth stone or wooden surfaces.' We quite agree that steel studs alone, while they grip the worst grease, slip on smooth stone or wooden surfaces if dry. This, however, must not be confused with the combination non-skid, such as the Rom, as this incorporates rubber with steel, the steel gripping on the grease, but the rubber projections performing their function as a non-skid on all dry surfaces, stone setts, etc. As regards the studs injuring the casing, this is quite impossible by reason of the special construction of the casing and tread."



LOST AND FOUND.

We receive many letters regarding accessories, etc., both "Lost and Found," which we are unable to find space for. As these particular matters are of interest to two persons only, viz., the finder and the loser, we keep a list of such articles, and, should we receive a letter from the finder which corresponds to the article lost, the two persons are put into communication.

THE G.W.K. CYCLECAR.



The G.W.K. chassis.

The complete cyclecar.

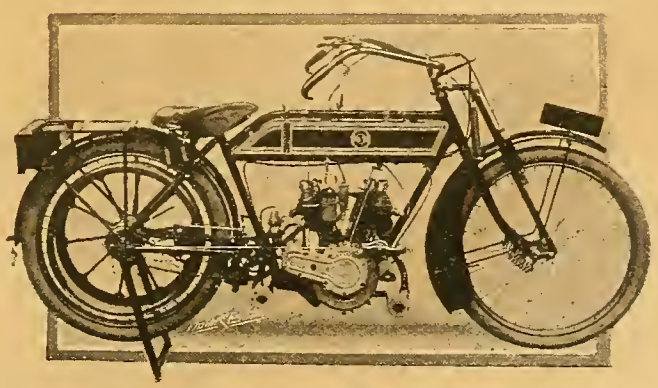
AN interesting little four-wheeled runabout is the two-cylinder G.W.K., which is soundly constructed throughout, and is a thoroughly practical little vehicle on motor cycle lines. Its motive power is a two-cylinder vertical, water-cooled Coventry Simplex engine, 86 × 90 mm., 1,046 c.c.; the magneto and water pump are driven off the camshaft.

Rear view showing change speed lever (inside), rear brake lever (outside), clutch, foot brake and accelerator pedals, rear axle, propeller-shaft, and torque rod.

The frame is of pressed steel, and the engine is carried transversely in it on two cross members. The engine is situated midway in the frame, and both it and the transmission may be easily reached by lifting a lid in the coachwork behind the driver's seat. The large flywheel acts as a friction disc, the friction wheel which engages with it being faced with a special fibre preparation. The system of drive and gearing will be familiar to our older readers when we tell them that it is somewhat similar to that used on the Armadale tricar. The square shaft carrying the fibre wheel is kept in contact with the disc of the flywheel by means of a strong adjustable spring. The forward end of the square shaft carries the foot brake drum, while its after end terminates in a universal joint, of which there are two on the propeller-shaft. The final drive is by bevel to a well-designed differential rear axle. The rear wheel brakes are of the internal expanding type. Declutching consists in moving the fibre wheel away from the driving disc, and naturally when driving, the further the fibre wheel is from the centre of the driving disc the higher is the gear. Any number of gears may be had between two points, and if the fibre wheel be pushed to the other side of the centre of the driving disc the reverse is obtained. The pedal which controls the friction disc, and may be called the clutch pedal, also applies a brake if depressed to its fullest extent. It is interesting to note that the adjusting collar, which increases the tension of the spring for the fibre faced wheel, is also used for the adjustment of the foot brake.

The steering is of the rack and pinion type. The steering rod is carried in an eccentric bush, so that wear can be easily taken up by turning the eccentric bush until the teeth of the pinion are further engaged with the rack teeth.

The chassis is sprung on semi-elliptical springs forward and on Lanchester type springs at the rear. The radiator is of the multi-tubular type. The front axle is tubular, and the wheels are 26 × 2½. The body has high side doors, and seats two people side by side. Ample foot room is provided under the bonnet, at the front of which the radiator is carried. The whole is low built and of racy appearance. Altogether the design impressed us most favourably, and though perhaps a little prejudice may at first be encountered against the friction drive, we do not see for a moment why this should not be satisfactory in the case of so light and so medium powered a vehicle. It will be noticed that the engine easily comes within the 1,100 c.c. limit recently imposed by the R.A.C. and A.C.U., and no difficulty will be experienced in bringing the chassis weight within the prescribed limit, as it already weighs within a few pounds of the 6 cwts. unladen.



ENTRIES FOR T.T. RACES.

The following additional entries have been received by the Auto Cycle Union for the Junior and Senior T.T. races on June 28th and July 1st. The entrants do not mention what make of machine they intend to ride:

SENIOR RACE.—W. L. T. Rhys, Rex G. Mundy, P. Johnson, and E. B. Ware.

JUNIOR RACE.—Rex G. Mundy, P. Johnson, and E. B. Ware.

TWIN PREMIER WITH A NEW DESIGN FRAME.

The latest model 3¾ h.p. twin-cylinder Premier has a dropped top tube to give the lowest possible riding position, and it will be agreed that its appearance has been considerably enhanced thereby.

Midland Open Reliability Trial.

H. C. Pickering writes us that what we mistook for a water tank on his A.J.S. machine in the Sutton Coldfield trial was in reality a quart spare petrol tank. From this we can only suppose that on Edge Hill the tap became turned on, as we have a distinct recollection of liquid dripping on to the cylinder.

Motor Cyclists and the Coal Strike.

In the event of the railway service becoming more seriously disorganised than it is at present, motor cyclists will be entirely independent of trains. This was brought forcibly to public notice last year during the railway strike. Hundreds of motor cyclists were enabled to keep their business and holiday appointments with the aid of their motor cycles.

Something Entirely New.

A three-speed counter-shaft gear was seen undergoing test on a 3½ h.p. Triumph on Edge Hills last week-end. We understand that it is the latest production of the Triumph Cycle Co., Ltd. We have known for some time—in fact we said as much—that the company in question is not altogether favourably impressed with the two-speed gear, deeming the change from low to high gear too big a jump. We would urge readers not to approach the Triumph Co. for further details of the new gear at present; as soon as anything definite is decided an official statement will appear in these columns.

Sidecars and their Excellence.

As a really luxurious sidecar turnout, we have examined few to equal W. H. Wells's new 7 h.p. Indian with Canoelet body on a specially strong frame. The other day the owner invited us to go a short spin with him, and we were indeed most impressed with the luxury and general suitability of the combination. Naturally, one expects something good of Mr Wells, and his particular Indian engine undoubtedly is the most silent motor cycle engine it has been our pleasure to sample to date, and the even manner in which it would turn over at slow speeds without the slightest fuss was indeed an eye opener. It can truly be said that one has not experienced to the full the joys of sidecaring until an opportunity of a ride in such a luxurious turnout comes one's way

Large Funds but No Organisation.

The Auto Cycle Union received £104 9s. 6d. to organise its one-day spring trial on Saturday last, viz., forty-three entries at £2 2s. = £90 6s., and twenty-seven entries at 10s. 6d. = £14 3s. 6d. Surely this is sufficient to have arrows erected every half-mile if need be, and all the officials travel on luxurious cars throughout. Ever since Saturday our telephone bell has been ringing, the motor cycle manufacturers asking quite seriously what is being done in view of the hash. We can only retort "Wait and see." The A.C.U. committee are not likely to let such a muddle slip past without a proper enquiry.

English-Dutch Trial.

The latest amateur entrant is E. Lester (3½ h.p. P. and M.) We have to acknowledge entrance fees for the trial from F. Dover, G. Smith, Vernon Taylor, C. W. Wilson, Horatio Wallis, R. Cussons, J. C. Bennett-Mitchell, Seymour Smith, H. M. Carter, and A. E. Uffleman.

The Dutch M.C.C. have written strongly recommending that the trip be extended another day, or otherwise it will be impossible to see Volendam. Their suggestion is:

Saturday, August 3rd.—By boat to Holland.

Sunday, August 4th.—The Hague, Scheveningen, and Amsterdam.

Monday, August 5th.—Trial.

Tuesday, August 6th.—To Volendam and back to Amsterdam.

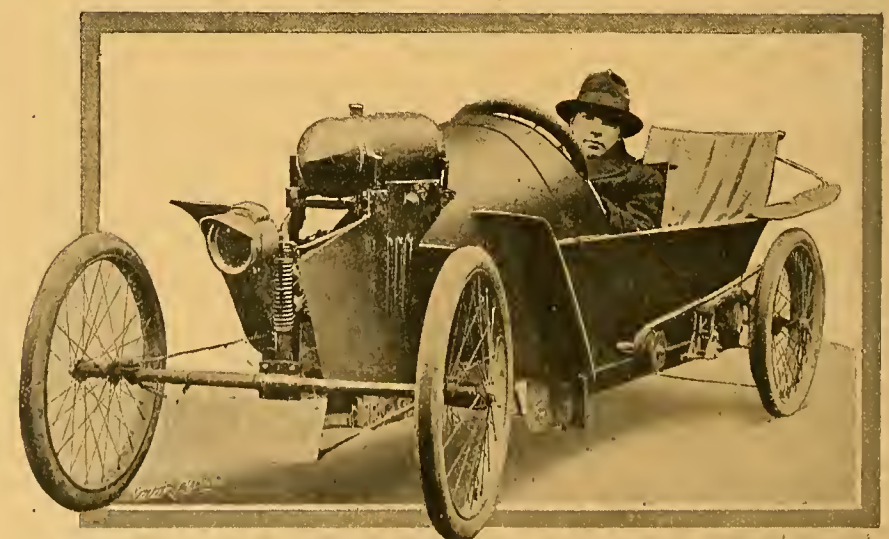
Wednesday, August 7th.—*Via* Haarlem to the Hague and Hook.

Thursday, August 8th.—Arrival at Harwich, 6 a.m.

SPECIAL FEATURES.

The Evolution of Engine Timing.

A.C.U. One-day Trial and its Shortcomings.



The Future of Engine Design.

Coventry Club's Reliability Trial.

The open reliability trial which is being organised by the Coventry and Warwickshire Club for Saturday, May 4th, will be over a secret course, which will not be divulged until a few hours before the start of the competition. It is, however, an open secret that the course will be a severe one, including the counties of Warwickshire, Worcestershire, and Gloucestershire.

Honister Pass.

The outcome of recent correspondence in *The Motor Cycle* with regard to the possibility or otherwise of climbing Honister Pass will be an attempt by Frank Smith to climb the hill on Saturday next on his Clyno, the sidecar seat of which will be occupied by G. Smith *(The Motor Cycle)*. The party will leave Keswick (Quick's Garage) for Buttermere *via* Newlands Vale in sufficient time to reach the Fish Inn, Buttermere, at 2 p.m., the climb to commence from Gatesgarth to the top of the Hause at 2.30 p.m. Afterwards another ascent to the top of the pass will be made by way of the Old Coach Road. In view of the correspondence which followed Mr. H. Newman's challenge in this journal, there is sure to be a crowd of motor cyclists to witness the attempt.

The cyclecar to which Mr. Low's forced induction engine, described last week, is fitted. The driver's seat is in the middle, which allows a more comfortable position for the driver when the machine is used solo.

French Club Run.

The Motor Cycle Club de France had a run from Paris to Evreux on Sunday last.

Cyclecars in the Tour de France Automobile.

Two Bedelias and one each Ronteix, Violette, Ponette, Sphinx, Phänomobile, Dumond, and C.L.C. are competing in the Tour de France which started on Friday last, and will finish on the 20th inst. All the machines mentioned above are in the voiturette class and built on the lines of the cyclecar.

The Motor Cycle on the Stage.

It is a novelty for a stage play to be written round the production of cycles and motor cycles. "Captain Billy" is the name of a play produced at the Royalty Theatre, Redditch, on Thursday last. Thrilling incidents of the play are when the heroine is thrust by the villain into an electrically heated enamelling stove at the Enfield Works, and the capture of spies, who have broken into the works to obtain possession of secret specifications, by the hero, Captain Billy, who arrives at an opportune moment, of course on an Enfield motor bicycle.

The Trade and the T.T.

The secretary of the Manufacturers' Union, Mr. Alfred Bednell, has addressed a letter to the press in which he points out the views of the manufacturers' section regarding the T.T. Races. An extract from the letter reads as follows: "I submit with all respect that the attitude of the trade on the T.T. Race question has been misconstrued. An impression has been created that the trade is inclined to discourage the sport. Exactly the contrary is the case. The trade takes the view that the private owner is altogether at a disadvantage if he is called upon to compete with trade riders, and that the sport and pastime will accordingly suffer unless events in which the trade rider is to compete with the private owner on even terms are restricted."

The L.C.C. Again in the Wrong.

An important case came before Mr. Denham at the Marlborough Street Police Court on the 13th ult. The L.C.C. sought to impose the tax in respect of two cars which had been tested on the highway bearing the ordinary dealers' identification marks. The case was taken up by the A.A. and M.U., as it was one of great importance to the makers of motor cars and motor cycles, for it would be a great hardship to hold a maker liable for the tax on every car or cycle that he had for sale, all of which undergo a road test. Mr. W. T. Parkes appeared for the defendant. Mr. Denham dismissed the case with two guineas costs against the L.C.C. Fortunately for motorists, the London magistrates not only understand the law, but administer it without fear or favour. We wish we could say the same for all benches. It will be remembered that quite recently the L.C.C. tried to compel Lord Russell to fill in particulars of taxes for which he was not liable and made a paltry attempt to make it appear that he had kept a car without a licence. Mr. Curtis Bennett dismissed the case with three guineas costs against them.

FUTURE EVENTS

Mar. 16.—Essex M.C. Open Hill-climb.
" 23.—B.M.C.R.C. Race Meeting.
" 23.—Herts. County A.C. Open Quarterly Trial.
" 30.—Derby and District M.C.C. Open Hill-climb.
April 5-8.—N.W. London M.C.C. & Herts. County A.C. Joint Trial and Open Hill-climb (Yorks.) and Ladies' Competition.
" 8.—Westmorland M.C.C. Open Hill-climb at Brigsteer Brow.
" 13.—Oxford M.C.C. Hill-climb.
" 13.—Liverpool A.C.C. Open Reliability Trial.

War Office Orders for Motor Cycles.

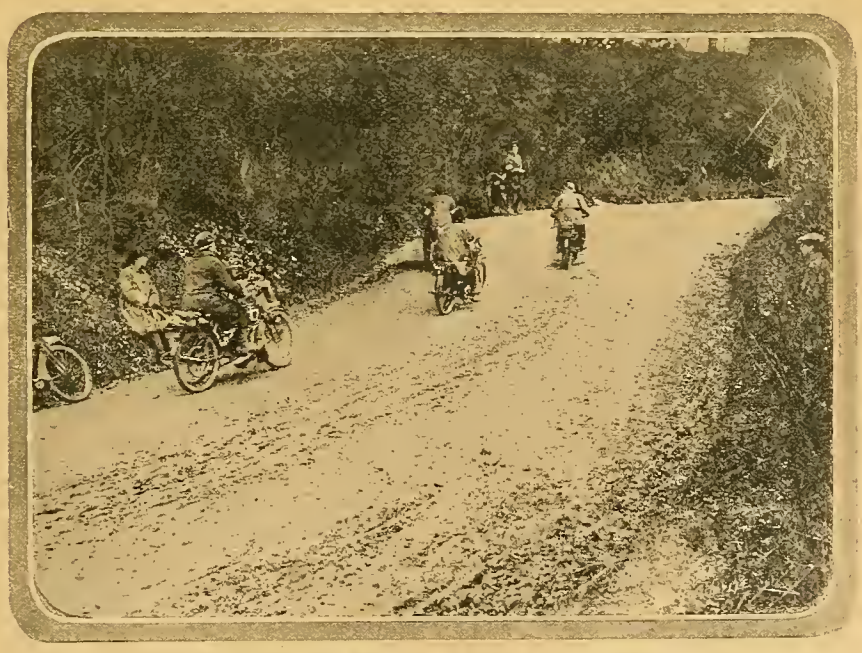
The recent War Office Tests at Brooklands have resulted in several firms having received instructions from the War Office to supply motor cycles which are to be subjected to severer tests than those they recently went through at Brooklands. The firms who have notified us as having received orders are Douglas Bros., Phelon and Moore, Ltd., Rudge-Whitworth, Ltd., Triumph Cycle Co., Ltd., Premier Cycle Co., Ltd., and Zenith Motors, Ltd.

L.G.B. and the Noise of Motor Cycles.

Last week a question was asked in Parliament relating to the noise of motor cycles. Mr. Burns (President of the Local Government Board), replying to Mr. Guinness (U., Bury St. Edmunds), said: I did not find it practicable to apply the recent regulation as to the use of a cut-out to motor cycles. What is required in the case of a motor cycle is not merely that the use of a cut-out should be prohibited, but that the cycle should be provided with an effective silencer, and I have under consideration the question of issuing an order on the subject.

One Day Trial Incident.

Mr. A. H. Priestly, who was doing excellent work as a marshal during Saturday's trial, had a curious incident happen to him at Horsham, where he placed his sidecar machine close to a fountain opposite the King's Head Hotel. An old inhabitant objected to the machine being there, and on being gently reminded it was no business of his, assumed an aggressive attitude, and had eventually to be removed by a policeman.



New Speed Limits.

The Local Government Board has sanctioned a ten miles an hour speed limit in the parish of Petworth, Sussex, upon many of the roads in and adjoining the town. Motor cyclists are advised to observe these limits with care.

A ten mile an hour speed limit is also in force at Richmond, Middlesex, on Bridge Street, and on so much of the road running over the river bridge as extends from the junction of the bridge with Bridge Street to its junction with Willoughby Road, Twickenham.

R.I.A. Activities.

The National Vehicle Owners' Association, an influential organisation of horse-owners, with headquarters at Birmingham, and one of the constituent bodies of the Midland Centre of the R.I.A., has agreed to circulate to its members cards, to be hung in stables, etc., conveying specific instructions to drivers to keep, at all times, as near as possible to the left kerb. This action by the horse-owners themselves is extremely valuable and demonstrates very forcibly the useful service rendered by the R.I.A. in combining all forms of road traffic in road matters. Special action is being taken by the Midland Centre of the R.I.A. to obtain an improvement in the road from Packington to Coleshill. The road, which has long been in bad condition, is reparable by Lord Aylesford.

A.C.U. ONE DAY TRIAL, WHICH PROVED A FAILURE.
A string of competitors climbing Cudham, the first of the two test hills.

A French View of the Motor Cycle.

THE current number of the *Touring Club de France Gazette* contains an interesting article on the motor cycle from a French point of view. This article deals with the 1912 French models, and compares them with English machines.

The writer claims that the sidecar, although practically unknown in France, was invented many years ago by a Frenchman named Bertoux. This will cause considerable surprise to some of the British sidecar makers. However, he does not say when M. Bertoux invented the sidecar, but says it was at first applied by him to a pedal bicycle. The same writer also claims that the free wheel as fitted to the pedalling gear was first patented in France.

He outlines the history of the sidecar, and points out why British machines differ so much from those used by French riders, and implies that the greatest difference is due to the fact that the British rider in the majority of cases desires to use a sidecar, whereas the French up to the present time have made very little use of this handy passenger attachment. Clutches, change-speed gears, chain transmission, and other items found on English machines, he says, have all been introduced on account of the sidecar, whereas in France it has always been held that a motor bicycle should be light in weight and as free as possible from mechanical complications. British motor cycles, he says, are usually over 150 lbs. in weight, and English riders do not look upon £80 as an exorbitant price for a powerful twin-cylinder sidecar machine with change-speed gear and free engine. The French ideal he instances by the following specification:

Very light single or twin-cylinder engine of about 2½ h.p., simple belt transmission, variable gear by means of an expanding pulley, and of a total weight unladen not exceeding 100 lbs. Quoting further from the article he points out that French motor bicycles have usually been looked upon as too heavy and too powerful, and now there is a growing dread that another enemy to the advancement of the pastime threatens French manufacturers, viz., mechanical complications. Finally, it is somewhat startling to read that in the opinion of the T.C.F. contributor the French roads, which we have always regarded as superior to British ones, are too rough for the comfortable use of a sidecar combination, and that the voiturette is the type of vehicle he recommends for passenger-carrying. Surely the low cost of running a sidecar in comparison with a small car has its advantages, and in our opinion the scarcity of sidecars in France would be better excused by reference to the lack of knowledge regarding these attachments and want of enterprise among most French makers.

Putting the sidecar question on one side, the French ideal specification is not a bad one, but in this country we have been educated not to look upon complication as an undesirable feature, provided the mechanism be reliable.

The R.A.C. Road Guide Scheme.

CONSIDERABLE adverse criticism has been published in the public press about the scheme of road guides now under consideration by the Royal Automobile Club. The R.A.C. therefore invited members of the motoring and motor cycling press on Thursday night last to listen to a full explanation of the idea from Mr. J. R. Nisbet, who is one of the vice-chairmen of the Auto Cycle Union. The scheme intimately concerns the motor cyclist, as no fewer than 5,000 members of the A.C.U. and affiliated clubs will benefit thereby. The idea, Mr. Nisbet pointed out, is no infringement; it is merely an extension of the R.A.C. guide scheme. The R.A.C. had since its inception offered all the advantages put forward by other bodies, save free legal defence, which was not inaugurated till 1910, and had gladly helped the A.A. and M.U. in every way, especially as regards the foundation of its touring department. The R.A.C. had fought the motorists' battles since 1895, and had spent altogether £60,000 in so doing. Below we give an outline of the scheme:

That the present system of appointing R.A.C. local guides should be enlarged by placing men in uniform:

1. At great junctions where there is a choice of routes.
2. At cross roads at times of abnormal traffic.
3. In the neighbourhood of towns on market days.
4. In the touring centres during the touring season, and at the R.A.C. hotels in much frequented towns.
5. At places where members and associates may require special information.
6. In places where inconsiderate driving has been reported, to prevent the imposition of a speed limit.
7. At certain ports, to assist motor tourists.

That the duties of the guides should include:

To report any exceptional damage to road surfaces.

That the guides stationed outside certain large towns should have at their call a corps of assistant guides, who would pilot motorists through the town for a small fee.

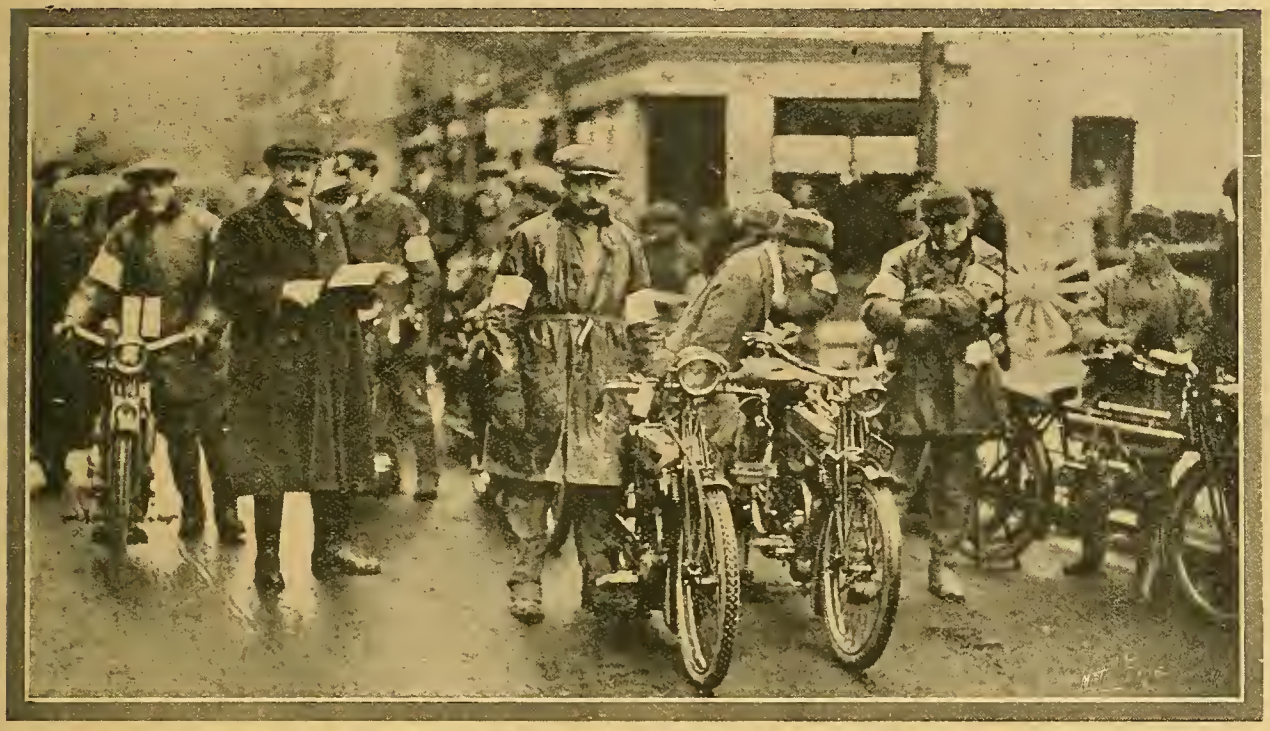
That the guides should carry maps and plans of the towns and districts in which they are employed.

That the guides should wear R.A.C. uniform, and should be described as "R.A.C. Touring Guides."

That the men selected should be recommended time-expired service men as far as possible.

That a number of the guides should be permanently employed, others should be temporarily employed.

The press dinner was held in the Great Gallery, and was followed by an excellent musical entertainment.



M.C.C. LAND'S END AND BACK RUN.

The entries for the above run which will commence on April 6th are already coming in apace. Readers will doubtless remember that the above M.C.C. event consists of a twenty-four hours' run from London to Land's End on Friday, April 6th, returning on Easter Monday, April 8th. The principal trophy put up for competition is the Jarrott cup presented by the president, Mr. Charles Jarrott. The trials hon. sec. is Mr. E. Gwynne, White Lodge, Crediton Road, West Hampstead. Entries to date:

S. May (8 Portland-Jap).
S. G. Frost (4½ V.S.-Jap).
C. Patteson (2¾ Enfield).
H. Patteson (2¾ Douglas).
G. E. Purchase (3½ Triumph).
F. J. Watson (3½ Swift).
L. A. Baddeley (7 Indian).
D. S. Baddeley (3½ P. & M.).
H. Karslake (3½ Rover).
S. C. Perryman (3½ Ariel).
F. C. North (3½ Ariel).
S. J. Saunders (3½ Rudge).
E. Pond (3½ Rudge).
J. R. Haswell (3½ Triumph sc.).
G. G. C. Pigott (5 6 Zenith-Gradua).
A. P. Dickinson (3½ Triumph).
W. Pratt (3½ P. & M.).
L. A. Mather (5-6 F.N.).
H. R. Deighton-Simpson (3½ Triumph).
H. Greaves (2¾ Enfield).
B. Alan Hill (7 Indian sc.).
E. Gwynne (3½ Triumph).
A. G. Peppercorn (3½ Bradbury).
W. B. Gibb (2¾ Douglas).
V. Olsson (3½ Trump-Jap).

THE A.C.U. ONE-DAY TRIAL.

A Chapter of Accidents. A Direful Finish. Trial Annulled.

The start from Croydon at 9 a.m.

SATURDAY, March 2nd, will be remembered as an unfortunate day in the annals of the Auto Cycle Union. March, following ancient tradition, came in like a lion with boisterous winds. The previous day's rain rendered the roads in an execrable condition; grease of the worst type, deep soft ruts, and a cold, almost sunless day made the riding conditions of the worst. The course was a highly sporting one, but it necessitated the negotiation of many byelanes, was most intricate, and needed scrupulous care in marking. Hardly an arrow was in its place. The official car promised for this work failed to materialise. Mr. J. W. G. Brooker was sent on at the last moment on a sidecar which promptly broke down, with the result that almost every section was unmarked. The course had been kept secret only too well. No one had any idea of his position when he lost himself, as he had had no opportunity of studying the country he had to traverse. Then the day finished up with a perfect deluge of rain, and the trial was declared null and void, but more of this later. As regards the weather overhead, the trial did not start so very badly. The scene outside the Swan and Sugarloaf Hotel was a busy one. The new judges, Captains Davidson and Nicholl, were hard put to it examining the machines, and were ably helped by the more experienced members of the competitions committee. Mr. Feeney, the other judge, worked like a Trojan at the scales, helped by Mr. Hart, and the weights of the competing machines, fully laden and ready for the road, given below make interesting reading:

Rider.	Machine.	Gear.	Weight in lbs.
B. Haddock	(2½ A.J.S.)	A.J.S. 2-sp.	176
R. G. Mundy	(3½ Singer)	Armstrong 3-sp.	232
S. A. Rowlandson	(3½ Rudge)	Rudge variable	258
W. E. Cook	(3½ A.S.L.)	N.S.U. 2-sp.	214

H. Johnson	(3½ Triumph)	Single gear	208
H. A. Shaw	(3½ Scott)	Scott 2-sp.	245

The A.C.U. One-day Trial.—

An A.C. sociable coming over the top of Polsteeple.

The passenger machines were not weighed. N. Ayers (3½ h.p. Singer) created quite a sensation by the extraordinary slow running of his engine. He walked away and left his machine jacked up on the stand, with the engine giving a quiet puff once every second, and all the world wondered. Ware was driving his famous Chater-Lea sc. machine with the latest Stewart-Precision carburetter. He seemed far from well, and little fit to drive in a reliability trial. F. G. Edmond's Humber had a very neat belt guard, and the method of enclosing the valves on Deacock's Alldays was worthy of comment. Frasetti was driving a new Indian and sidecar. The dropped frame and springing of the latter were worthy of note.

A Start at 9 a.m.

A late start was made, as weighing operations took a good deal more time than was anticipated. Incidentally, some of the figures revealed by the balance needle, caused some astonishment in more than one instance, and it is interesting to compare the actual weights with makers' catalogue estimates, remembering, of course, that the trials machines were equipped for touring, and in all cases had lamp and generator and complete kit of tools, and ninety-five per cent. had change-speed gears. Nearly all got away cleanly and well, the A.C.U. clause demanding a free engine having one good effect, at least, viz., the entire absence of the panting rider galloping alongside his machine to start a cold engine. Instead, a dig at the pedal or foot-starter, and the engine readily responded with a crisp bark. In some cases the low gear lever was engaged, and the rider calmly walked alongside, hopped into the saddle, and away the machine would go.

Warlingham was the first point on the route, and, overtaking a Rudge rider who had forgotten to fasten his tool-bag, we were able to perform a useful service by halting to collect the bits and scurrying after him again.

Hardly had Warlingham been left behind than the usual tale of woe commenced. Two competitors—F. Ball (Douglas) and F. W. Applebee (Centaur)—were side by side cleaning out jets, and barely a quarter of a mile further we overtook G. L. Fletcher performing the evolution of attempting to clean his jet without dismounting. In free-wheeling down a hill he had actually removed the throttle slides, and would soon have completed the operation but it was time for the engine to fire and he had perforce to stop. Polsteeple Hill took many competitors by surprise. The road was greasy, and is extremely narrow. Over half the competitors failed owing to being baulked, as a fallen passenger machine occupied nearly the whole of the road, and could not be moved for some time.

C. T. Gray (Rudge), H. G. Dixon (New Hudson), and H. Berwick (New Hudson) ascending Polsteeple Hill. Observe the narrow track.

At Tatsfield nearly all the competitors went wrong. Up to this point a solitary A.C.U. arrow had been noticed, though many times there had been need for one, and along with Haddock (A.J.S.) and Edmond (Humber) we continued by the signposts, eventually arriving at the top of Cudham Hill. In a moment or two another bunch of competitors arrived by the same route. Messrs. Straight and Hart, who were at the hill summit, directed them all to descend the hill to Downe and come up again by the orthodox way, but, of course, the value of the test with engines comparatively cool was considerably negatived.

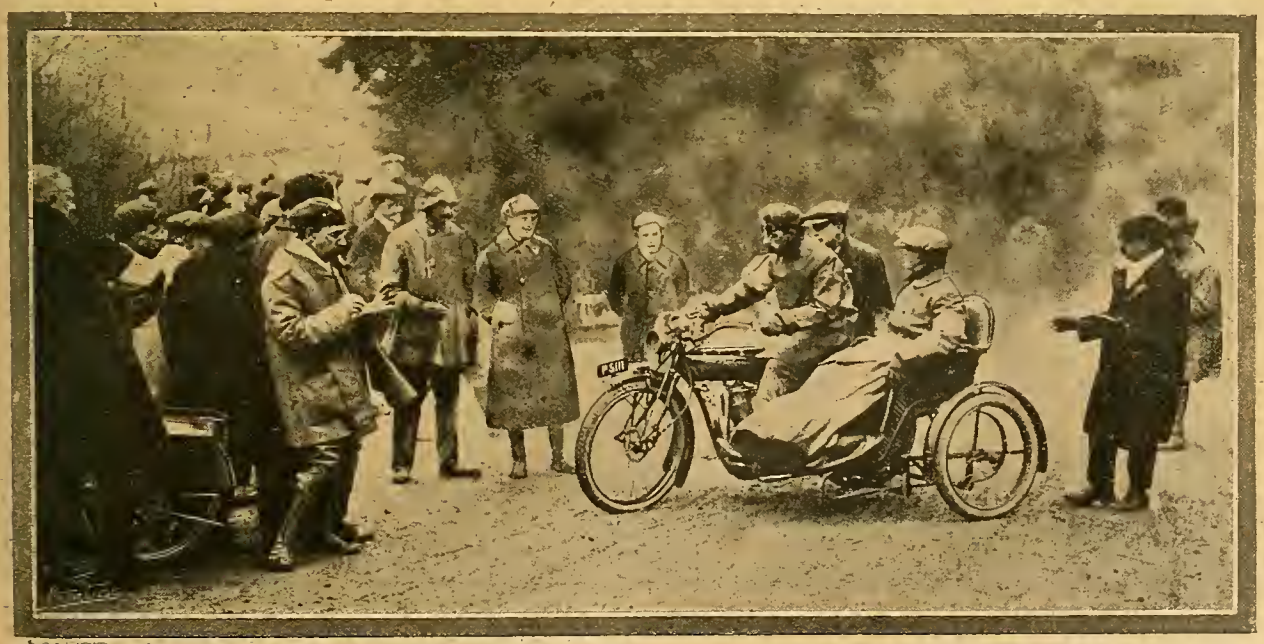
Cudham and its Victims.

The approach to Cudham was unpleasantly greasy. The Knap, Trough, Devil's Elbow, or whatever the steepest part of Cudham calls itself, was soft and slithery, and as bad as could be. It is a really steep hill, and the best of its kind near London. We may begin reporting this climb by saying that every man who made a clean ascent deserves congratulation. The successful ones were: V. Taylor (3½ Rudge), W. Pratt (3½ P. and M.), Mrs. Hardee (3½ P. and M.), P. Phillips (2¾ Douglas), L. Newey (3½ Ariel), F. C. North (3½ Ariel), F. Dover (3½ Premier), A. J. Sproston (3½ Rudge), V. Busby (2¾ Humber), T. Pollock (3½ James), R. Lord (6 Rex), C. Tinline (3½ Rudge), H. Berwick (3½ New Hudson), H. G. Dixon (3½ New Hudson), W. F. Newsome (3½ Triumph), E. W. Cheshire (3½ Triumph), G. T. Gray (3½ Rudge), W. L. Overend (3½ P.V.), B. Haddock (2½ A.J.S.), G. Drew (6 Zenith), L. E. Cass (4½ Quadrant), H. Hills (3½ Premier), J. W. Ayers (2½ A.J.S.), J. Cocker (2½ Singer), J. Oliphant (3½ Premier), who surmounted the hill with difficulty, N. A. Ayers (3½

The A.C.U. One-day Trial.—

R. Lord (6 h.p. two-speed Rex) on Polsteeple Hill, twelve miles from the start.

Singer), R. G. Mundy (3½ Singer), who just managed to reach the top, C. Pressland (3½ Rudge), and A. H. Wright (5 A.J.S.)



The following passengers performed remarkably well: E. B. Ware (8 Chater-Lea and sc.), H. F. S. Morgan (8 Morgan runabout, with A. G. Reynolds as passenger) particularly good, F. Smith (5-6 Clyno and sc.), S. T. Tessier (8 Bat and sc.), C. R. Collier (8 Matchless and sc.), and A. J. Stevens (5 A.J.S. and sc.), who managed well, despite the excessive slipping of the driving wheel.

The spectators, of whom there were goodly numbers on non-competing machines, were none too careful about keeping the course clear, and several failures were due to the competitors being obstructed.

We have now the unpleasant duty of recording the unsuccessful performances: S. A. Rowlandson (3½ Rudge), V. Tomkins (3½ Rover), Rev. E. P. Greenhill (2¾ Douglas), H. Mills (3½ Premier), who was baulked by J. Kear (3½ N.S.U.), N. O. Soresby (3½ Rudge), R. Hare (2¾ Enfield), H. Johnson (3½ Triumph), who assisted with his feet, O. C. Godfrey (7 Indian and sc.), B. A. Hill (7 Indian and sc.) assisted with his feet, but completed the ascent, H. G. Ayers (3½ A.S.L.), F. E. Pither (2¾ Enfield), F. Hill (5-6 A.C.), C. O. Roberts (3½ Rover), W. S. Stagg (5-6 A.C., the dash of which was broken), J. Chater-Lea (8 Chater-Lea), whose failure was solely due to back wheel slip, T. R. Trotter (3½ B.S.A.), E. Frasetti (7 Indian and sc.), E. Vallis (5-6 Clyno and sc.), baulked by a private owner, W. O. Oldman (8 Bat and sc.), who later had the whole combination turned over by a cart, R. E. Guest (8 Matchless and sc.), and A. J. Luce (6 Zenith and sc.), who then retired.

But after Cudham the marking of the route was a little better. Before reaching Seal we passed V. Tompkins (3½ h.p. Rover) repairing a puncture. After leaving that place there was a long winding hill to climb, which, however, caused no failure. Next followed a four miles stretch of the greasiest road surface it is possible to imagine. It was soddened with the continuous rain of the last few days, and even the motor cycles caused deep ruts as they passed over it. A sigh of relief was breathed when this section was left behind. Imagine then the feelings of the competitors when a P. and M. rider, failing to find arrows at any of the cross roads, decided that the men had taken the wrong turn, and commenced to retrace his wheel marks! The majority, however, preferred to keep on, and after many conjectures as to the right road and failure to find any names referred to on the route card, a party of twenty or thirty came to a standstill utterly flabbergasted. F. C. North went to a cottage to ask the way to Moreworth, according to the route card. The mystery was deepened when the reply came that no such place was known in that district. The real name, it appears, is Mereworth—pronounced Merryworth—which accounted for the misunderstanding. On the route was a certain Roughway Hill, and here an observer waited for two hours, and not a soul came by. *All* the competitors left the course at this point.

The denunciations of the A.C.U. and its methods were now thick and fast, and pronounced in no uncertain manner. Thus early the trial had developed into a farce, and thereafter no

E. Frasetti (7 h.p. Indian and sidecar) stops on Cudham; due to over gearing.

The A.C.U. One-day Trial.—

T. R. Trotter (3½ h.p. B.S.A.) and H. A. Shaw (3¾ h.p. Scott) at the second corner on Cudham.

one regarded it seriously. Competitors continued their own way, and by pure guesswork eventually did find a direction arrow to Plaxtol, and away we all went for Paddock Wood, near which place we actually found an A.C.U. official at a convenient stop.

At the next village we stopped to notice, as the competitors filed past, the most silent machines. We particularly made notes of the quietness of the P.V.-Jap, Scott, twin A.J.S., Hill's Indian, and Smith's Clyno sidecar. S. A. Rowlandson (Rudge) had a sideslip at Goudhurst. Nearing Tunbridge Wells, Spray Hill had to be climbed, but caused no failures.

The crowd which watched the riders arrival and departure from Tunbridge Wells might not have evinced the interest they did in the A.C.U. trial if they had been aware of the many weaknesses of its organisation.

The machines were stored at Rawson's Garage, and lunch was served at the Castle Hotel.

The Afternoon Run.

Leaving Tunbridge Wells, a southerly course was struck *viâ* Forest Row to East Grinstead. Still the all-important arrows on such an intricate route were missing, and it would be a surprise to us to hear that any single competitor kept on the right track. Near Forest Row a competitor took a wrong turning, realised his mistake and suddenly pulled up, which caused our photographer to crash into him, the latter escaping with slight injuries. Turner's Hill, outside East Grinstead, is a winding ascent two miles in length, which brought low gears into requisition. We allowed twenty or thirty competitors to get ahead, and then continued our way. In three miles we came to a fork, and A.C.U. officials on board a Humber car told us that at least a dozen riders had taken the road to the right, whereas the left-hand road was the correct one. Leith Hill, we imagined, would cause some failures, though we personally saw no one stop. An official was posted here. It now came on to rain, and it simply poured, so everyone scurried to Horsham, where, at the King's Head Hotel, tea provided by *The Motor Cycle* was in waiting for the rain-soaked competitors.

Here we got into conversation with two private owners of 6 h.p. Enfield sidecars who had followed the competitors round the course, though not competing. We remarked upon the splendid way we had noticed them negotiate the hills, and learned that one of the drivers was a complete novice, and had never driven a motor vehicle of any description except the Enfield of which he had that week taken delivery.

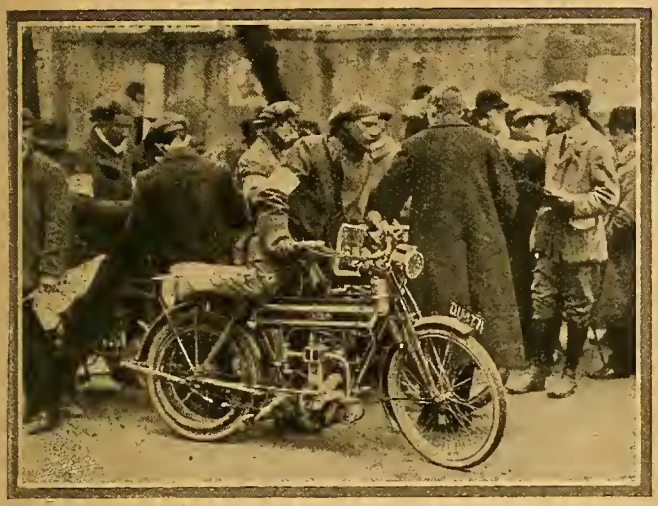
The tea interval was lengthened from fifteen to thirty-five minutes, which announcement still further displeased the disgusted competitors, as it meant a finish in darkness. Presumably the idea was to enable A.C.U. arrows to be put up on the last section.

The roads were simply atrocious, surface water causing competitors many an anxious moment as the engine raced round due to a slipping belt. Quite a number had, however, guarded against this trouble by fitting guards such as we have illustrated on numerous occasions.

The driving rain somehow or other drenched the best of mackintoshes. White Down Hill was the next incident in the trial, and its surface was in a very greasy state. The condition of the road and the awkward corner were the sole difficulties the hill presented. The first arrivals turned up in a blinding rainstorm, and having successfully negotiated the bend were obstructed by an official car. The plucky Mrs. Hardee on a P. and M., closely followed by the gallant W. Pratt, cleverly dodged the obstruction; Edmond (3½ Humber) managed to get by; Lord's Rex, though misfiring, got up, also Rowlandson (Rudge), Gray (Rudge), Newey (Ariel), Tinline (Rudge), Kerr (N.S.U.), Oliphant (Premier), V. Taylor (Rudge), Phillips (Douglas), Drew (Zenith), Soresby (Rudge), Haddock (2½ A.J.S.), Trotter (B.S.A.), O. C. Godfrey (Indian and sc.), Newsome (Triumph), Dixon (New Hudson), H. Berwick (New Hudson), Mundy (Singer), Cheshire (Triumph), Busby (2¾ Humber), Pollock (James), Pither (Enfield), Tomkins (Rover), very quiet, Mills (Premier), who nearly fell, Greenhill (Douglas), Cocker (Singer), Overend (P.V.), N. Ayers (Singer), Brice (Brown), Ball (Douglas), Cook (A.S.L.), J. Ayers (2½ A.J.S.), and North (Ariel), who all made good ascents. Roberts (Rover) and Johnson (Triumph) heeled on the ground, Deacock (Alldays) failed through slipping belt, and Frasetti (Indian and sc.) was unsuccessful.

White Down Hill.

The rain increased in violence as the journey was continued *via* Effingham, and we passed four in quick succession effecting adjustments, viz., G. Cocker, whose 2½ h.p. three-speed Singer had been running splendidly, and climbed all hills *en route*, Frasetti and his Indian, and Fletcher (Douglas). Frank Smith (Clyno) who had been off the route, commenced hurrying to catch up time, and his back tyre burst. How it rained, and what a day to be remembered!



Pebblecombe Hill, the Second Timed Test.

"Pebble" Hill, the last timed ascent (White Down was only an observed hill, on which Captain Davidson officiated), was reached in the dark and pouring rain. Here Captain Nicholl was on duty. He is a keen motor cyclist, but his Clyno had broken down early in the trial. It poured in

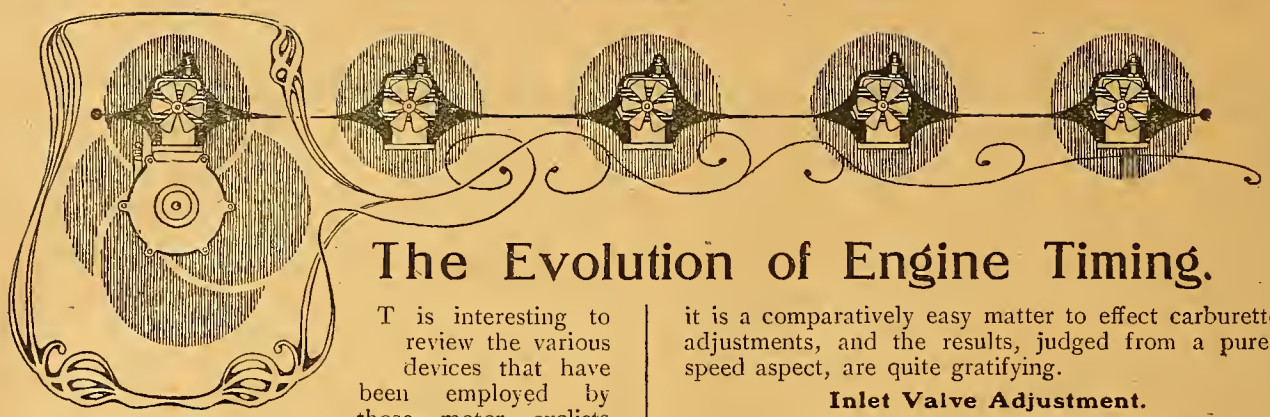
At Cudham. F.C. North (3½ h.p. Ariel), who successfully climbed all hills.

The A.C.U. One-day Trial.—

G. Cocker (2½ h.p. three-speed Singer) checking in at Tunbridge Wells, the luncheon stop.

torrents, and was now so dark the men's numbers were indistinguishable, and the timekeepers' watches could not be read. Taylor came up very slowly with his exhaust pipe glowing in the gloom, with men running beside him warming their hands against the pipe. Belts were slipping on many machines, the competitors were tired, soaked through, and miserable, and after a short interval the timing was abandoned. Mrs. Hardee, who had done splendidly up to Pebble Hill, failed at this point, but practically all the remainder who were successful on Cudham again succeeded.

We tore through the grease on our little twin Humber—a more stable machine one could not imagine—and marvelled how it was possible for the engine to keep up its putter-putter under such conditions. But our rejoicing was timed too early; the searching rain at last told its tale by first cutting out one cylinder, and soon No. 2 followed suit. Diagnosing a mysterious trouble under a tree which gave no shelter at all, what time the water trickled down our neck in most discomforting fashion, is all very well to read about, but is not our most favoured occupation. Water in the carburetter or petrol tank we at first conjectured, but ultimately we found that the magneto had ceased work, nor would cleaning or contact breaker adjustments restore the errant spark. Water on the armature was the final diagnosis. We must therefore ask our readers' forbearance for lack of road incidents during the last few miles of the run.



Observations.

Thus ended a fateful day. Men knew not how they got home. Wet and blinded by the rain they came in one by one to Croydon, many having lost their way and wandered miles off the route. Grumbles were heard on all sides, and, to make matters worse, those who were successful learned later in the evening that all their trials, all their troubles, and all the discomfort they had endured had been of no avail. The judges and those of the Competition Committee who were present met together and decided that, as the route had been so badly marked, and there was no means of either observing the men, or of knowing who left the course and who did not, the trial would be annulled. Those who asked for their entry fees back would have them returned, or if they did not ask for them to be returned they could be credited with them on a future occasion. It was decided to run the trial again, preferably near the Midlands, and April 20th was suggested as the date; there was some talk, however, of holding the trial on a Wednesday.

All this trouble could have been avoided by a little enterprise and initiative on the part of the A.C.U. staff. Too much is left to honorary officials, and we must say we cannot refrain from censuring those responsible for the blunder. As the car which was to take the officials to arrow the route did not appear, why could not an official, mounted on a motor cycle, have laid a confetti trail at the last moment? Something must be done and that quickly to prevent a *fiasco* of this kind occurring again.

C. Pressland (3½ h.p. Rudge) and R. G. Mundy (3½ h.p. Singer) climbing Cudham. The gradient at the steepest point is 1 in 4½. Observe the road to Downe winding away in the distance.

The Evolution of Engine Timing.

IT is interesting to review the various devices that have been employed by those motor cyclists whose business or pleasure it is to enter into competition with their fellows, and verily the more one reflects the more one marvels at the assiduity with which the problem of obtaining more speed and power has been attacked. No part of the engine seems to have been left untouched to secure this end, and I propose to make a short article out of the various "fakes" that have come to my knowledge during my motor cycling career, in the hope that it may prove interesting to some, at least, of those who read it.

Ever since hill-climbs became popular about six years ago (I always consider that it was the A.C.U. Hill-climb at Birdlip in September, 1906, which really set the ball rolling), a continual struggle has been waged by, on the one hand, the expert to get the last ounce out of his machine, and the ordinary rider, on the other hand, to find out how he does it. The former of course always tries to keep his dodges as dark as possible, but rumour is very busy in matters of this sort, and as soon as anything leaks out, others are not slow to experiment on similar lines.

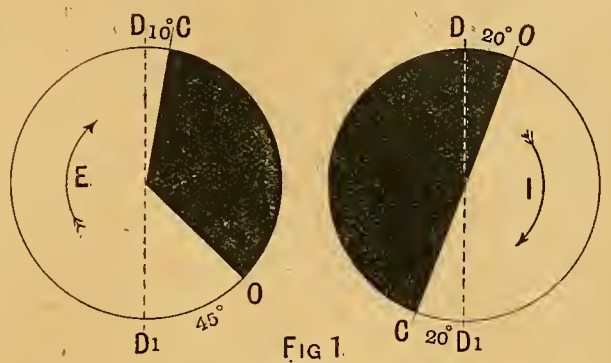
Crank Case Release.

The first fake I remember was practised at the aforementioned Birdlip hill-climb, I believe by that redoubtable veteran, Mr. F. W. Applebee, who argued that by removing the crank case drain plug, there would be less resistance to the piston and other reciprocating parts, consequently an increase of power. I should have thought that the consequent lack of "cushioning" action (so well known in steam engine practice) would have militated against the success of this scheme, but anyhow it was stated that a certain engine which would not climb Birdlip with the drain plug in made a creditable ascent as soon as it was removed. No doubt the oil pump had to be kept going! I recollect hearing of this dodge on only one subsequent occasion, and that was when a certain rider, who performed wonders in hill-climbs in 1906-7 on a 3½ h.p. single-cylinder, was discovered one day with a frightfully dirty engine, which vomited oil from the bolts holding the cylinder to the crank case. These had been drilled to act as auxiliary air release holes!

Carburetters did not receive much attention until a well-known *Motor Cycle* noter stated that by using a cork carburetter float he had been able to obtain a remarkable increase in speed—so much so, in fact, that he succeeded in beating even the trade rider of his particular make of machine in hill-climbs. This started a wave of experiment, which has continued to the present day, among amateur speed merchants, as it is a comparatively easy matter to effect carburetter adjustments, and the results, judged from a purely speed aspect, are quite gratifying.

Inlet Valve Adjustment.

So far I have only dealt with single-cylinder machines, and it is a remarkable thing that until this year the motor cycle tuner seems to have confined his attentions to the single-cylinder engine almost exclusively, consequently the twin has not been developed with anything like the same rapidity as the single. Yet there was one rider of the twin engine—need I say that it was Mr. W. H. Wells?—who obtained some phenomenal results in hill-climbs some years back, and I personally ascribe his success in a large degree to the fact that he thoroughly understood the adjustment of the automatic inlet valves. A strong spring and a small opening was the rule with these valves, but after seeing engines with valves that had through wear got a terrific opening and flabby springs to boot, their owners being evidently quite unaware of this primary rule in engine efficiency, I do not wonder that the average twin-cylinder machine of three or four years ago did not do its five horse-power's worth, or anything like it; even when adjusted correctly the automatic valve did not retain that adjustment for long, and it is a laborious business to check lifts and spring strengths every few hundred miles. While considering the subject of twins, we must not forget Mr. Arnott's 5 h.p. V.S. "Humming Bird," with its two inlet valves per cylinder, adjustable sparking plug gaps, and special carburetter with a jet to each cylinder, which machine I consider represents the high water mark of engine faking, beating even his converted Triumph with two additional valves in the valve caps! The "Humming Bird" is credited with a speed of about seventy-five miles an hour, I believe, and was not fitted with an inordinately high gear.



Forced Induction.

This article is not written with the idea of assisting riders to obtain seventy miles an hour from their 500 c.c. engines, but merely to chronicle a few engine fakes of the last few years. As I write I have memories of the picric acid that was at one time mixed with the petrol with the idea of increasing power (*en passant*, it has since been stated that picric acid crystals are not soluble in petrol) of systems of forced induction, for which purpose a pipe is led from the crank case to the inlet pipe or carburetter, of the oil mixed with the petrol, in which a well-known rider at Brooklands has great faith, and the now fashionable rose jet. I think the strangest tuning wrinkle I ever heard of was from a chauffeur, who assured me that if I lubricated the valve stems of my engine copiously with paraffin (!) a marvellous improvement in speed would result!

The Evolution of Engine Timing.—

There is, however, yet another factor in obtaining engine speed—perhaps the greatest of all—which I have not yet touched upon and which has only recently become a matter of common knowledge outside the ranks of the experts. I refer to valve timing. It is, of course, now well-known that a certain very successful rider at Brooklands has a very special valve timing, the secret of which he says he would not sell for £100, and, further than that, I will go so far as to say that, if we except one or two engines, no track records of recent date have been made with the standard valve timing as fitted to road machines. Those riders who have done any scorching at Brooklands and have taken any pains to ascertain their speed either by watch or speedometer will bear me out when I say that (again excepting one or two engines) the road machines do not approach the speed of the track "specials" by a considerable margin—in one case that came to my knowledge by eighteen miles an hour. We advance our ignition a little, we put in a big jet, and we increase the air supply, and do all the other little things that are so dear to the heart of the motor cyclist, and yet apparently similar machines in the hands of the trade rider do infinitely better. We ask ourselves, "What else is there to do?" and our question has long gone unanswered, but I believe "the cat is out of the bag" at last. It is the amount of overlap that is given to the valves. The inlet valve does not wait until the exhaust valve closes before it opens; the closing of the exhaust valve is retarded or the opening of the inlet valve is accelerated, perhaps both, so that both valves are open together for a short space of time, called overlap. The diagrams will, perhaps, make it more easily understood. That overlap timing gives wonderful results may be judged from the fact that Mr. H. Martin's 1¾ h.p. machine has travelled at over sixty miles an hour. I understand, too, that the speed of Mr. C. R. Collier's record Matchless may be ascribed to valve timing. I do not propose to deal with the mechanical side of engine tuning, as that would deserve a special article. Enough if I say that some of the racing pistons are triumphs of fretwork skill!

Fig. 2.—Valve timing, showing the overlap of the inlet and exhaust. Each circle represents one revolution of engine. The black parts show when the valves are closed. The overlap is shown shaded.

A BUSY WEEK-END IN CHESHIRE.

The dry roads and sunshine in the North last week-end brought thousands of motor cyclists out from the Manchester district on the famous Chester highway.

Sheffield and Hallamshire M.C.C.

The above club held a whist drive on Thursday, the 29th ult., at Hudson's Restaurant. One hundred members and friends were present.

Southsea M.C.C.

A meeting, to which all motor cyclists are invited, will be held at the King's Hotel, on the 11th inst., at 9 p.m., to discuss the formation of a motor cycle club.

Scarborough M.C.

The annual general meeting took place on the 28th ult., at headquarters, and the following officers were elected: Chairman, Mr. R. W. Ringrose; captain, Mr H. Frain; hon. treasurer, Mr. G. H. Storey; hon. sec., Mr. J. W. F. Tranmer. The first important event of the season will be the hill-climb on Staxton Hill on Easter Monday.

Crossgates and District M.C.C.

The formation of a motor cycling club in this suburban district of Leeds has met with considerable favour. Over forty members have enlisted since its origin (a fortnight ago) and everything points to it being a successful organisation. The first official club run is to take place on Saturday, the 30th inst., at 2 p.m. from the headquarters, Brown Cow Inn, Whitkirk.

Coventry and Warwickshire M.C.

The annual general meeting will be held on Friday, March 15th, at the King's Head Hotel, at 7.30 p.m. A series of lantern slides will be shown during the evening by Mr. T. Blyth Clayton, of Birmingham. Next day (Saturday) the opening run and speed-judging competition will take place, meeting at the residence of the president, Mr. M. J. Schulte, Hill Crest, Kenilworth, at 2.30 p.m. It has been decided to award *The Motor Cycle* 50 guinea cup for the best aggregate performance in competitions during 1912.

Otago M.C.C. (New Zealand).

A slow hill-climbing competition was held on the road leading up to Vauxhall on a recent Saturday, when, despite the showers which fell, an interesting afternoon's sport was provided. The competitors were divided into pairs, and the last man up of the two was declared the winner of that trial. The machines were not allowed to be geared below 6 to 1. The winner, A. McDougall, had his machine beautifully tuned up, and well deserved his victory

Bristol B. and M.C.

The open hill-climb will take place on April 27th.

Blackburn M.C.C.

The second annual hill-climb will take place at Waddington Fells on April 5th. There are two open classes, and ten classes for members, one being for old machines, which should afford an interesting means of comparison.

Mersey M.C.

A breakdown competition was held on Thursday, the 29th ult., at headquarters. On Friday, the 8th inst., at 7 p.m., at headquarters. Mr. Chas. F. Larkin, F.R.C.S., will give a description, illustrated by lime-light views, of a "Motor Tour in the North."

Doncaster and District M.C.C.

A most successful gymkhana was held on Thursday evening last, the 29th ult., at the Doncaster Roller Rink. There were fourteen entries for each event, but owing to the limited time, and the number of entries, the last event (Victoria cross race) had to be postponed to a future date. The winners of the gold medals for the two events were: Balloon breaking, Mr. C. Barnsdale (3½ h.p. Rex); musical chairs, Mr. F. H. Dunstan (3½ h.p. Rudge).

Bristol M.C.C.

The recent dinner was a great success, about fifty members being present.

A lecture was given by Mr. A. E. Bennett, of the Bosch Magneto Co., on Wednesday, the 21st ult., at which over 160 were present. Forthcoming events are: Opening run dinner and speed-judging competition on March 9th. Lecture on "Speed and Power," by Mr. MacMinnies on 14th. Inter-club trial with Exeter and District M.C.C. on 23rd. Members' competition on 30th. The open hill-climb is on April 20th.

Belfast and District M.C.

At a meeting held on the 29th ult., the final arrangements were made regarding the open hill-climbing competition on April 8th on Knocksaughey Hill, which is near the famous Giant's Causeway in the North of Ireland. The gradient of this hill, which is on a principal county road, is 1 in 3½. A very hearty invitation is extended to all cross-Channel riders, many of whom have already signified their intention of being present. Full particulars from Mr. William Kearney, 53, Donegal Place, Belfast.

Cambridge University M.C.C. half-mile speed test at Pampisford last Saturday, which was abandoned owing to the pouring rain
1. Reid (Triumph) in the class for standard touring singles. 2. General view of the starting point.

Club News.—

Hampshire M.C.U.

At a committee meeting held at Winchester on February 28th a provisional programme was arranged. Early events are as follows:

April 5th.—Meet at Salisbury.
,, 28th.—Meet at Brooklands.
May 15th.—Social meet and hill-climb at The Grange, Alresford.

North Staffordshire M.C.C.

The first annual meeting will be held this evening at the club headquarters, the Saracen's Head Hotel, Hanley, at 7.30 prompt. Any local motor cyclists who wish to join the club will be heartily welcomed. A very attractive sports programme has been proposed for 1912, including several invitation events.

North Middlesex M.C.C.

The opening run will take place on March 16th, starting from headquarters, Ye Olde Gate House, Highgate, at 2.30 p.m. All keen motor cyclists are cordially invited. Those members who intend to take part in the Easter tour and reliability trial should notify the hon. secretary at an early date.

Cornwall M.C.C.

The annual dinner and meeting was held at Clywas Hotel, Truro, on Friday, February 9th. The following officers were duly elected for the ensuing year: President, Dr. Meace; captain, Mr. Tressider; hon. sec., Mr. A. C. Sims. All Cornish motor cyclists are invited to join, and any particulars may be obtained from the hon. sec., Mr. A. C. Sims, "Tedworth," Enys Road, Camborne. Several cups have been presented to the club for competition.

Liverpool A.C.C.

The first of a series of short-distance non-stop trials was held on the 25th ult. Nine members made non-stop runs.

The other trials of the series will take place weekly till Easter, as follows, starting at 10.30 a.m. March 10th, Sefton Arms, Aintree, to Southport; March 17th, Sefton Arms, Aintree, to Parbold; March 24th, Broad Green to Runcorn and Chester; March 31st, Broad Green to Hale (circular route).

Other early events are the breakdown competition and penalty run to Kendal.

James Hodgson (3½ h.p. T.T. Bradbury), winner of the Transvaal single-cylinder motor cycle championship for 1912. He covered 3½ miles on the road in 8 min. 39⅘ secs.

Llanelly and District M.C.C.

A meeting will be held at the Thomas Arms Hotel on Tuesday next, the 12th inst., at 7.30 p.m., for the purpose of forming a motor cycle club. All motor cyclists in the district are cordially invited to be present.

Derby and District M.C.C.

The result of the re-run winter trials for the Russell Cup was: W. H. Orme (Rudge), first; A. L. Spriggs (Bradbury), second. G. Brough (6 h.p. Brough) secured equal points with the winner on time, but was disqualified for pumping up tyre during the interval after first circuit, this not being allowed by the rules. Next event, invitation run to Abbots Bromley and Lichfield, March 16th.

Oxford M.C.C.

A special general meeting was held on Monday, the 19th ult., when a proposal was put forward to inaugurate a club room for the use of members, and it was resolved that a room should be taken at the Hotel Restaurant Buol, which should be fitted up entirely for the convenience of members. It was decided that a special subscription of 5s. should be charged to members desirous of using the room, over and above the club subscription.

Leicester and District M.C.C.

At an extraordinary general meeting, the position of the trade members was discussed and the following definition proposed: "That a trade member is any member who is directly interested in the sale of motor-driven vehicles as a source of income." It was moved that no trade member hold office or take executive part in competitions. Both motions were defeated, so that the position remains as before.

Manchester Amateur M.C.C.

A hot-pot supper will be held in the Mosley Hotel, Piccadilly, on Monday, March 11th, at 7 p.m. After supper a Triumph engine will be dismantled and put together again by a mechanic, through the courtesy of the Triumph Cycle Co. Tickets 2s. 6d. from the secretary. All amateurs cordially invited. The Easter tour will start on April 5th from the George and Dragon Hotel, Cheadle, at 9 a.m. The route to be followed includes Hereford, Ross, the Wye Valley, Aberystwyth, Dolgelly, Beddgelert, and Bettws-y-Coed.

Durham and District M.C.C.

A fault-finding competition was held at headquarters, Neville's Cross Hotel, on Saturday, February 24th, there being a record attendance. The late chairman, Mr. W. P. Robinson, who set the "fault," presented the prize, which took the form of an excellent pair of overalls. As no competitor succeeded in locating the fault at the first attempt of six minutes' duration, a second "round" was arranged, and in this only two competitors succeeded. Result: First, Mr. C. F. Christon; second, Mr. R. W. Holmes. Immediately after the competition, the chairman, Mr. G. Harrison, presented the late chairman (who is leaving for the South of England) with an inscribed silver cigarette case from the members of the club as a token of respect and gratitude for his past services as chairman and honorary treasurer of the club.

CONSUMPTION TEST IN AUSTRALIA.

The Motor Cycle Club of South Australia held a petrol consumption test on a hilly course of thirty miles, at Northfield, on January 20th, with the following results:

	Rider and machine.	Weight.	m.p.g.	Ton-miles per gall.
1.	H. Ragless (Triumph) ...	345	137.4	21.1
2.	A. J. Hinton (Norton)...	382	120.4	20.5
3.	J. Maggs (Triumph) ...	350	130	20.3
4.	T. Ragless (Norton) ...	346	131.3	20.2
5.	H. C. Pobjoy (Triumph)	387	116.8	20.1
6.	V. K. Towde (Triumph)	380	112	19
7.	G. G. Wadey (P. and M.) ...	323	126.2	18.2
8.	C. Lindsay (J.A.P.) ...	331	113.4	16.7
9.	C. Churchward (W.C. Lewis)	389	93.4	16.2
10.	E. Lewis (Triumph) ...	329	102.5	15
11.	F. C. Walters (Twin J.A.P.)...	443	63.2	12.5

W. Courtney (Lewis), H. J. Gilbert (B.S.A.), F. C. Gogler (Rex), and E. Lienert (Norton) were disqualified for dismounting.

A selection of questions of general interest received from readers and our replies thereto. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal queries should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Radiators on Exhaust Pipe.

I was much interested to see in your issue of February 1st a letter suggesting brazing on fins to the exhaust pipes. As I am experimenting with silencing devices on a noisy 8 h.p. twin, which I intend taking to a hot and hilly part of India, this idea seems to me to be of double assistance. I shall, therefore, be extremely obliged if you will tell me what objections there are, if any, to carrying out this idea, at any rate for a short distance along the exhaust pipe.—H.W.S.

We see no objection whatsoever to your making experiment of this idea. It can do no harm, and, on the other hand, may do a great deal of good.

Easy Starting.

I own a 3½ h.p. Minerva a.o.i.v. which when going is a thing of joy; it is, however, very difficult to start. I think this is due to the flywheels being rather small. The compression is perfect. It will not start slowly. I have tried all the usual tips, but in vain. I shall, therefore, be extremely obliged if you will advise me? I wondered if you knew of a decompressor.—T.F.S.

The firm in question never made a 3½ h.p. engine with a.o.i.v. With regard to your trouble, you might obtain easier starting if you fitted an A.M.A.C. decompressor, sold by the Aston Motor Acessories Company, Aston Road, Birmingham, or the variable compression device made by Messrs. Packer and Prentis, Roden Street, Ilford.

Bath to Margate.

Please give me the best route from Bath to Margate, with a Triumph sidecar. I want, if possible, to call at Woking. Perhaps you could give me a route to call at Woking and another way back?—R.A.

Your best route would be as follows: Bath, Chippenham, Calne, Malmesbury, Hungerford, Reading, Wokingham, Sandhurst, Bagshot, Brookwood, *Woking*, Ripley, West Horsley, East Horsley, Dorking, Reigate, Redhill, Godstone, Westerham, Riverhead, Seal, Maidstone, Charing, Canterbury, and Margate. You could not do better than follow the same route back as far as Dorking; after that go through Guildford, Farnham, Odiham, Basingstoke, Whitchurch, Andover, Ludgershall, Upavon to Devizes, Melksham, and Bath.

The Need of Rebushing.

There is clearance in the big and little ends of my 1911 twin to the extent of nearly 3-32in., also a perpetual knock if the engine is working hard—fast or slow. I think it needs rebushing, and that the cause was that the flywheels went out of truth a little while ago. I should be glad of your opinion on this. I have only run 3,600 miles, and feel sure rebushing should not be required so soon. If rebushing be the remedy, could you give me the names of firms who would do this thoroughly well?—W.A.E.

We should strongly advise you to put the machine in the hands of a repairer at once. It should not be run a moment longer than you can help with so much play in the big end. Probably it would be more satisfactory to take the machine to the makers than to employ a repairer, as no one can tune the machine up better than the makers themselves after fitting the new bushes.

Oil in Magneto.

I have a two-speed 4 h.p. 1909 Roc about which I would like some advice. (1.) How often should the magneto be oiled, and what effect would over-oiling have, and what spares should be carried for the magneto? (2.) How often should the engine have oil, the pump being a fair size? (3.) How far could one run on low gear without doing damage to the engine? (4.) I do not understand the mechanism of the two-speed gear. If anything goes wrong, what is it likely to be, and could a roadside repair be effected, and in case of breakdown could the spokes of the belt rim be wired up to the back wheel and thus make a temporary fixed gear?—TEMPUS.

(1.) You should oil the magneto about every 200 miles. Over-oiling will interfere with the efficiency of the magneto by spoiling the contact of the carbon brushes; it is easily wiped off. Very excessive oiling might damage the insulation of the winding on the armature. It is really best to carry a set of Bosch spares, or, if you do not care to carry all these, a spare high tension carbon brush and platinum points. (2.) Give the engine half a pumpful every five or seven miles. (3.) Do not run on the low gear longer than you can help, as it tends to overheat the engine. This is the only advice we can give you in this respect. It is possible, under exceptional circumstances, that you might have to use it for one mile if you are touring in a hilly district, but usually you would only have to use it just on the stiffest part of the hill, if your machine is developing its full power. (4.) The gear is lucidly explained in "Motor Cycles and How to Manage Them" (which can be obtained from these offices, price 1s. 2d. post free). The difficulty is more likely to occur in the low gear, and, in the case of a breakdown, the high speed clutch would lock the whole gear solid.

Too Thick an Oil.

I own a 2¼ h.p. Royal Enfield, and have great difficulty in freeing the pistons during cold weather. I inject paraffin usually, but when it is freezing I am obliged to warm the cylinders with a blow-lamp. I used to use Price's B lubricating oil, but lately have used Vacuum Mobiloil. Once the cylinders become warm they work freely.—C.T.R.B.

We can only think that you are using rather too thick a brand of oil for the cold weather. You may safely use water-cooled Vacuum oil or Huile de Luxe. You certainly should not have to warm the cylinders with a blow-lamp.

Numbers on Cardboard.

A friend of mine was out for a spin a few days ago and unfortunately lost his back number plate, and as he could not secure a proper plate, he got a piece of cardboard and printed the number in full on it and fixed it where the original plate was. While riding through the town of Eastbourne he was stopped by a police constable for not having a proper plate on his machine. Are there any regulations that the numbers must be printed on a standard plate? Can anyone be prosecuted for riding a motor cycle with the letters and numbers in standard size on cardboard?—A.C.

The law says that the letters must be of certain dimensions, and white letters on a black ground. Under the circumstances, a reasonable bench of magistrates would dismiss the case, but, strictly speaking, to print them in black on cardboard is against the letter of the law. If you are a member of any motoring organisation we should recommend you to take it up with their Legal Department. If the letters had been of the correct size and were white letters on a black card, the police would have had nothing to say.

Throttle and Valve Opening.

Kindly inform me on the following. I have a 2¼ h.p. Rex 1903 motor cycle, and recently had it fitted with B. and B. carburetter, h.b. control, but it does not answer to the throttle. For instance, after I have it half open a further movement does not make any difference to the engine speed.—J.M.

Possibly you have the wrong combination of jet and adapter. The former should be about .028 and the latter .42. Or if you have the universal pattern, try the lever in the middle and five holes open. It is, however, more likely that the inlet valve does not open far enough, or that the ports are too small, in which case no further opening of the throttle can have any effect. You can obtain sets of jets from Messrs. Brown and Barlow, Westwood Road, Witton, Birmingham. Tell them the bore of your engine and they will send you suitable sizes.

Dry Cells and Trembler Coils.

My machine is a 3½ h.p., and quite modern in every way except ignition, which is accumulator. I ran it nearly all last year, and never had any trouble with ignition, only the bother of having my accumulators re-charged. I have been advised to try dry batteries. Do you think it possible to run with them and a trembler coil and wipe contact breaker? About how many miles would an ordinary size battery run?—J.C.D.

We should advise you to communicate with Mr. A. H. Hunt, 115, Cannon Street, E.C., or Messrs. Siemens Bros., Woolwich, and tell them you require one of their dry batteries. Also send up your coil at the same time and get it tested. If they report that it is too extravagant in current you would have to purchase probably a specially economical trembler coil, otherwise the battery will very quickly run down. On the average, however, they should last about 1,600 miles each. It is advisable to carry two batteries connected by a switch, and use them alternately.

A.O.I.V. on Small Twin.

I am being offered a 1909 pattern 2¼ h.p. Moto-Rêve for £14. From the present owner's description it appears to be in good order and sound. I have been looking up some back numbers of *The Motor Cycle*, of which I have been a reader many years, and I am under the impression from an illustration of a 1909 Moto-Rêve that same has a.o.i.v's. Am I right in thinking so? For a lightweight of this type have m.o.i.v's. any advantage over a.o.i.v's? Also can you tell me what type of magneto was fitted to these machines? I shall be obliged if you will favour me with your opinion of the 1909 Moto-Rêve, and shall be pleased to know if you consider it a reliable machine.—W.M.

Yes, the machine in question had automatic inlet valves. Mechanical inlet valves have an advantage on a twin, though we may say in this particular case automatic valves work well. The magneto fitted to this machine is one specially made for the Moto-Rêve Company by a French firm. Both machine and magneto are quite satisfactory.

Macclesfield to Benfleet, Essex.

Please tell me the best way from Macclesfield to Benfleet (Essex). I have a 3½ h.p. two-speed N.S.U. and sidecar, so should like to avoid very bad hills and also much traffic.—H.S.J.

Your best route would be as follows: Macclesfield, Leek, Ashbourne, Derby, Loughborough, Melton Mowbray, Oakham, Stamford, down the Great North Road through Wansford, Stilton, as far as Huntingdon (in the neighbourhood of which drive with great care), then strike from Huntingdon to Cambridge, and on through Bishop Stortford, Harlow, Chipping Ongar, Brentwood, Billericay, to Benfleet. We do not think you will find any serious hills on this route.

One Cylinder won't take Air.

I have a small twin which has lately had new big end bearings and gudgeon pins fitted. When the engine was reassembled, the back cylinder refused to fire, except when the extra air was completely closed. Under normal conditions, the extra air is half open. The front cylinder takes the same amount of air as usual. There is a good spark at the plug. The valves do not stick and have the correct amount of clearance. There is no air leak that can be discovered, and the throttle slide opens correctly. Is there anything else that should be seen to, and is this at all a usual complaint with twin engines?—F.W.C.G.

The trouble might be due to the piston rings of the back cylinder being in line. You do not say what machine you are using, but if your carburetter is of the type that has a jet for each cylinder, you will find, in all probability, that the back cylinder jet is stopped up, in which case the front cylinder will be covered with soot owing to running on too rich a mixture. We have not experienced this trouble when the same jet has supplied both cylinders.

EXPERIENCES WANTED.

Readers desirous of obtaining the experiences of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries below should be addressed c/o The Editor.

"T.H.O." (Oxford).—5-6 h.p. 1912 Clyno.

"P.W." (Crowland).—Mabon gear on 3½ h.p. motor cycle.

"G.C." (Yardley).—2¼ h.p., 3 h.p., and 3½ h.p. Lincoln-Elks.

"J.N." (Southport).—Bowden extra air inlet on engine fitted with ordinary carburetter.

"M.A.A.C." (Parkstone).—3½ h.p. 1912 chain-driven Bradbury, two speeds, and 1911 Scott with sidecar.

"C.M.W." (Blackburn).—3½ h.p. two-speed Lincoln-Elk with sidecar.

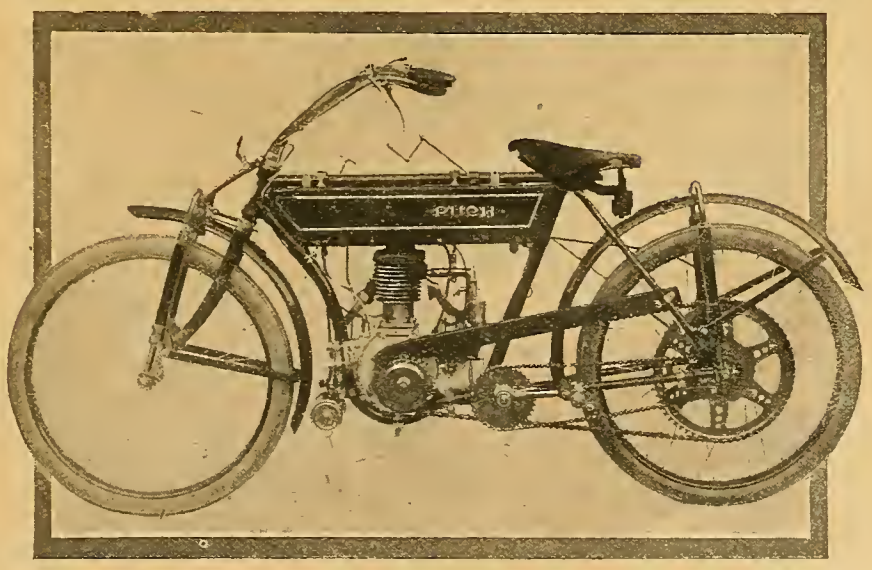
"E.A.O." (Sydenham). — Armstrong three-speed gear for sidecar.

"P.S." (Wigan).—2 h.p. Motosacoche free engine model.

"F.R.C.S." (Dublin).—2¼ h.p. shaft-driven F.N.

"E.R." (Harleston).—Mabon gear with Triumph and sidecar.

"J.S." (Totton).—Atlas puncture-proof inner case.



"Rex" (Chichester).—Armstrong three-speed gear for sidecar.

"W.H.G." (Bristol).—3½ h.p. two-speed Humber and sidecar, combined weight 18 stones.

"F.W.D." (Doncaster).—N.S.U. two-speed gear and Mabon variable gear on 3½ h.p. motor cycle with sidecar.

EDITORIAL NOTE.

The Editor disclaims all legal responsibility in any way for loss of copy in the form of manuscript, drawings, or photographs submitted to him. Rejected manuscript, drawings, and photographs will only be returned provided a stamped addressed envelope is enclosed for the purpose.

2½ h.p. Puch spring frame machine with single chain drive and two-speed hub gear. This Austrian make of motor cycle has an excellent reputation and should soon gain a hold in this country. All Puch machines have footrests, Zenith carburetters, and Dunlop tyres.

British Tyres in Paris.

The makers of the Wood-Milne steel-rubber tyres and belts are building up an extensive Continental business, with a depot at 212 ter. Boulevard Pereire, Paris, as a base

War Office Tests.

As a result of the success of the P. and M. in the recent War Office test at Brooklands, the firm has received an order from the War Office for machines to be supplied with a view to more prolonged trials under severer conditions.

Open all the Week End.

Many garages are not open all day on Sundays, but Mr. D. R. Clarke, of the Century Motor Works, St. Albans, informs us that his garage is open during the whole week-end, usually from 8 a.m. to 8 p.m., but later if necessary.

Rand M.C.C Competition.

On the 17th December last H. L. Weddell, riding a 3½ h.p. T. T. James, was successful in winning the Excelsior Trophy put up by the Rand M.C.C., South Africa. In this competition reliability, petrol consumption, and speed on the level and up-hill were taken into consideration. The petrol consumption worked out at 162 miles to the gallon, which is an excellent performance for an engine of 557 c.c.

1912 Improvements.

The oil tanks and forks of the Wilkinson T.M.C. have been recently re-designed, and the machine in its final form presents a very neat appearance. The front forks used will be the Saxon.

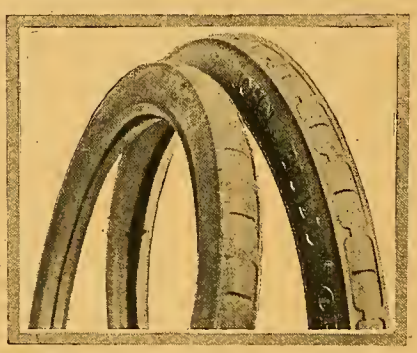
The neat little Grandex lightweight with its graceful frame dropped at the rear, which was favourably reviewed in *The Motor Cycle* Olympia Show report, will in future, be supplied with a light form of two-speed engine shaft gear specially made by the N.S.U. Company.

New Friction Driven Cyclecar.

Messrs. Robertson's Motor Agency, 157, Great Portland Street, inform us that they have secured the sole London and Southern Counties agency for the Lurquin and Coudert four-wheeled cyclecar. This vehicle is friction-driven and fitted with a 9 h.p. twin-cylinder water-cooled engine. The gear provides five speeds forward and a reverse. The same firm specialises in part exchanging second-hand machines for new Nortons, the balance being paid in cash or spread over monthly payments.

A Useful Handbook.

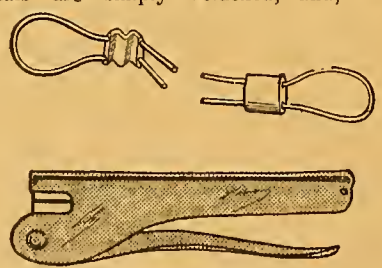
"All About Dunlop Tyres," 1912 edition, runs to nearly sixty pages. In addition to other items of interest to motor cyclists, it contains information about tyres and their treatment. Statistics in this booklet show that 371 Dunlop motor cycle tyres were fitted to machines at the last Show, or 32.77% of the total number exhibited on machines. Of belts fitted to motor cycles, Dunlops were on 25% of the machines shown, an advance of 17% on the previous year. Motor cyclists can obtain a copy of the booklet from any of the Dunlop Tyre Co.'s depots, or the head office, Aston Cross, Birmingham.



Interchangeable Wheels.

Mr. J. McGhie Lamb, whose interchangeable and quickly detachable wheel was described and illustrated on the 15th ult., page 190, informs us that several important motor cycle manufacturers have written asking for information regarding terms of licence.

Tyre Reliability.



The accompanying illustration depicts two John Bull Cross Groove covers made by the Leicester Rubber Co., Granby Works, Leicester. We are informed that the cover which shows the most signs of wear has done 12,000 miles, and the

newer one, shown on the right, has done 8,000 miles. These covers are vulcanised while subjected to great pressure, which causes the tread to be exceedingly tough, and also has the effect of forcing the rubber into the foundation.

A New Sealer.

Herewith we illustrate a handy tool for sealing motor cycle parts, for trials, etc. The sealer is only 5in. overall and weighs 6 ozs., so can be easily carried in the pocket. The stamp can be engraved with twenty letters. The seals are simply attached, and, once

affixed, cannot possibly be tampered with without detection. They are already in use with many gas, water, and electrical companies, and can be obtained from the British Porter Safety Seal Co., Ltd., Norfolk House, Laurence Pountney Hill, E.C.

Motor Cycling in New Zealand.

We are informed that at the Boxing Day meeting of the Hawke's Bay M.C.C. held at Hastings, New Zealand, J. Johnson (2½ h.p. Brown) was first.

Three-speed Counter-shaft Gears.

The Albion Engineering Co., Ltd., Tower Works, Upper Highgate Street, Birmingham, are shortly placing on the market a three-speed epicyclic counter-shaft gear, the middle and low gear ratios of which will be 27% and 50% reduction from the high gear. The gear will provide a free engine on all speeds, and will only have one internally cut gear wheel.

Trade Announcements.

The Rom Tyre and Rubber Co., owing to increase of business, have removed to larger and more commodious premises at 36, Brook Street, Holborn, E.C., a few doors from their old address.

Messrs. P. J. Budge and A. G. Daw have taken premises at 69, Leather Lane, Holborn, E.C., and deal in new and second-hand motor cycles and accessories.

Catalogues Received.

The frontispiece of the Bat catalogue shows two contrasts, the famous 2¾ h.p. spring frame Bat, which created such a sensation in 1902, and the 1912 two-speed chain-driven sidecar machine. A short history of this machine is given in the introduction. Each model is lucidly illustrated and described. The spring frame is shown in detail. The spring forks, stand, two-speed gear and other parts are illustrated, and the booklet can be obtained from the Bat Motor Mfg. Co., Penge, S.E.

We are in receipt of the two latest Bradbury publications. The motor cycle catalogue is one in which the various models are described. The other interesting publication is the book of the Bradbury 1912 3½ h.p. machine, which gives useful information regarding the various component parts, and hints on the use and maintenance of this well-known machine. Both booklets can be obtained from Bradbury and Co., Ltd., Oldham.

The latest Palmer Tyre catalogue deals with the three-ribbed, rubber-studded cord tyres and butt-ended tubes; also the ribbed and rubber-studded Palmer Privateer tyres, which are made of fabric, and are much cheaper in price. The booklet of Palmer tyres contains some very interesting information regarding tyre construction, some notes on motor cycle rims and on tyre repairs, and can be obtained from Palmer Tyre, Ltd., 119-123, Shaftesbury Avenue, W.C.

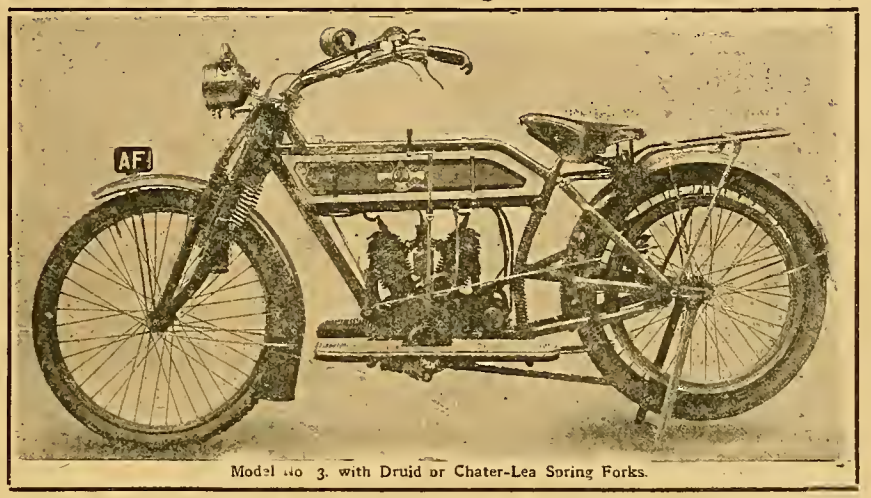
The Lloyd Motor Engineering Co., Ltd., 132, Monument Road, Birmingham, send us their complete catalogue for 1912. L.M.C.'s have been very successful in our colonies, in addition to their many wins in home events, and incidents in connection with these competitions, also tours, are illustrated by means of photographs, many of which are reproductions from *The Motor Cycle*.

The illustrated catalogue of the Coventry Eagle sidecars contains specifications and illustrations of seven separate patterns, all of which can be supplied with numerous alternative chair designs. These sidecars are sold under Millford patents by the Coventry Eagle Cycle and Motor Co., Coventry.

Another British Success!

This is the machine the connoisseurs are talking about so favourably.

The



'Perfectly Vibrationless'

Model No. 3 - 3½ h.p.

J. A. P. Engine

£55.

Fitted with N.S.U. 2-speed Gear .. .. £7 7s. extra.

Model No 3. with Druid or Chater-Lea Spring Forks.

It is so obviously simple, and so scientifically constructed, that detailed description is unnecessary. It is the smoothest running and most comfortable mount on the road. We invite your criticism and shall be pleased to see you at any time.

ADVANTAGES.

Hitchen's, of Morecambe, are not so conceited as to imagine that you will trade with them for any reasons other than because it pays you; and immediately it interests you to deal with someone else, they naturally conclude that you will do so; but AT PRESENT all the advantages are with you dealing with HITCHEN'S, of Morecambe, as follows:

NO OTHER FIRM in the world can give you such quick delivery of new models. At the time of writing we have ON THE PREMISES—

P. & M.'s, Scotts, Jap-Bats (chain drive and belt drive, with P. & M. two-speed gears), Clynos, Bradburys (two speeds, chain drive models due this next month), F.E. Rudges and single speeds (two-speeds coming through this month), Premiers (lightweights, single speeds, and two-speeds, also lightweight three-speed), Zeniths (3½ h.p., 6 h.p., and 8 h.p.), Lincoln Elks, A.C. Tricars, Triumphs (F.E. models), Matchless (5-6 h.p. and 8 h.p., two-speed gear models), New Hudsons (three-speed gear), Indians (7 h.p., two-speed gear), Indians (clutch models), Motosacoches (two-speed), Humbers (two-speed), and Humbers (lightweights, three-speed).

Besides these, we have other models of the same makes, also Morgan Runabouts and Model K Douglas, coming through; and we would like you to ask yourselves the question: Is there any other firm in the world who has as many as these? Is there any firm in the world who have MORE than these? And we think the answer will be, NO! Hitchen's have the largest stocks in the kingdom, and this they always intend to have.

They CONSIDER THEMSELVES in a position to treat you well, and, if you are WANTING a machine, get on the jump and **telephone, wire,** or **write at once,** stating what machine you want to buy, and your commands shall have prompt attention. You will clearly see the GREAT ADVANTAGES of dealing with Hitchen's, of Morecambe, and of having such a large stock to choose from.

Morecambe MAY BE a LITTLE town, out of the world in many things; but it is in MORECAMBE where Hitchen's, of Morecambe, are located. It is in MORECAMBE where the LARGEST stocks of Motor Cycles in the whole world are stored, and it is to MORECAMBE you ought to come, or write, when you want to buy a Motor Cycle. Just in the same way as Port Sunlight is noted for soap, so Morecambe is noted for Motor Cycles; and, as Port Sunlight has risen by the sale of soap, so Hitchen's, of Morecambe, are RISING by the sale of Motor Cycles!

Another of the SEVERAL ADVANTAGES that we wish to drive home to you is that you NEED NOT BE FAST as to HOW you are going to buy a Motor Cycle. Our system of business is as flexible as indiarubber: You are simply asked how you want to buy, and what you want to pay for it. If you cannot answer these two questions, then you don't want a Motor Cycle.

Get on the jump and write to Hitchen's at once and say what you want to buy and how you want to pay for it, and whether you have anything to swap or not. If you have anything to swap, say what it is. Don't write for cash terms, and at the finish say there is SOMETHING THAT YOU WANT TO SWAP, and pay the BALANCE on the DEFERRED. If you are asking for a cash price, we want the money, and no PROMISES to PAY so much per month. We can CUT THE THING FINE for cash down.

We consider that if a man is paying for a machine in twelve months that he is having the advantage of our money, and therefore he should not expect us to cut all the profit away for his benefit. IN ANY CASE you will find OUR TERMS, whether Cash, Exchange, or Deferred, better than other dealers. You must know that no man has anything to GIVE AWAY; and if you are out to buy a machine, you will find Hitchen's, of Morecambe, will be able to do as well for you as anyone else, and BETTER THAN MOST.

DON'T place your order with the little trader who has machine ON ORDER for delivery so-and-so: **he may have,** but **he may not**—and most likely will not get it at the time mentioned, and you are then "up the pole." The proper way is to buy from Hitchen's now, when it is HERE in the garage, and then you are sure of getting it.

The advantages to the trade in dealing with Hitchen's, of Morecambe, are VERY GREAT. Hitchen's have purchased £45,000 worth of Motor Cycles, and can always accommodate the trade by exchanging what Hitchen's have for what the trade has; or, on the other hand, let them have machines (where the makers have no objection) at a trade discount. There is no branch of the business that Hitchen's do not take up, unless you call the fact of giving a machine away a branch of the business; if so, this is a line that we are not interested in at the moment. We can nearly give something away, however, as we have a few accumulator machines at the very modest and interesting price of £4 19s. 11½d. If the bhoys have a £5 note in their pocket, and will blow over to Morecambe, they can have one; but don't ask for one of these on the DEFERRED payment terms, as it is in this case "dibs" down, or we keep the machines.

We want everybody to ride a motor cycle, but we want the bhoys who expect to get a 1912 machine for £3 down please note we cannot accommodate them in this direction. If they are prepared to pay down from one-fifth to one-third down, we can then do business, and look forward to hearing from them.

Don't imagine that, because we have this week spoken of nothing but new machines, that we have no second-hand ones, because we HAVE. There are close upon 200 here stored at Morecambe, and lists of these are printed every week. If you have not got one, you **should have one.** Get on the move and GET ONE: a postcard will DO THE TRICK. At the same time, we will send you a long list of accessories that we want to get rid of, as we wish them out of the place, and we don't intend to replace them, so NOW IS THE OPPORTUNITY for the bhoys to get something cheap. Our room is too limited for storing and selling accessories. We intend, however, to keep on a few of the leading lines, such as Lucas and F.R.S. lamps, Cowey and Jones speedometers, and things of that kind. So now YOU HAVE IT STRAIGHT! If you want anything, NOW is the time to get it. Look handy.

Remember the old address:

Telephone: "112 Morecambe." Telegrams: "Motor, Morecambe."

LUKIN SINGLE CONTROL CARBURETTER.

EXTREMELY SIMPLE. ABSOLUTELY AUTOMATIC. VERY FLEXIBLE.

"The Motor Cycle" says:—

"... We have had the opportunity of giving it (the Lukin) a thorough road test on one of our machines. The Lukin has given great satisfaction under all conditions; it enables the engine to run extremely slow (slower in fact than any standard carburetter we have tried) and at the same time the engine will pick up at once on suddenly opening the throttle, without any of the hesitation which is a feature on only too many present-day carburetters...."

A rider who uses a Triumph machine fitted with the Lukin says:—

"... I need hardly add that the engine keeps much cooler when using the Lukin, as the mixture is always correct...."

A rider who uses a Rudge machine fitted with the Lukin says:—

"... I am getting over 100 miles per gallon. I fully endorse all you say with regard to the merits of the carburetter, which is so much pleasanter to drive with, especially in traffic, than the old-fashioned two-lever type...."

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 14 words or less 1/6, and 1d. per word after. Each paragraph is charged separately. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor Street, E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should state distinctly under what heading and in what issue the announcement appeared.

CLASSIFICATION BY LOCALITY.

For the convenience of purchasers of second-hand motor cycles, the advertisements are classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Plan showing division of England into Sections.

SECTION I.
Northumberland, Cumberland, Durham, and Westmoreland.

SECTION II.
York and Lancashire.

SECTION III.
Carnarvon, Denbigh, Flint, Cheshire, Derby, Stafford Shropshire, Montgomery, and Merioneth.

ASK FOR TO-DAY'S LIST.

Send details of your used motor cycle, and receive our handsome offer of its utmost value in part payment of a new model.

WAUCHOPE'S,
9, SHOE LANE,
FLEET ST., LONDON, E.C.

'Phone: 5777 Holborn. Wires: "Opificer, London."

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or it "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR BICYCLES FOR SALE.

1911 Bargains.—Bradbury, shop-soiled, £39; 2¼h.p. 2-speed F.N., in splendid order, £32; 3½h.p. Premier, ran 150 miles, £33; 14-guinea Millford castor cane sidecar, hardly used, £11/5.—The Brighouse Motor Agency, Bailiffe Bridge, Brighouse.

BARGAIN.—8h.p Bat, new June, 1911, J.A.P. automatic carburetter, J.A.P. adjustable pulley, heavy tyres, Garner whistle, all spares; owner buying similar machine, 1912 model; cost £65, sell £48; condition as new.—Marshall, Cannon Hill, Lancaster.

S. GRANGE'S 1911 T.T. Triumph for sale, winner of Bradford Club speed trials, 72¾ miles per hour, also winner of open hill-climb, fastest amateur in England, guaranteed in splendid condition, spares, tools, etc.; price £40.—Brocklehurst, Park View, Cleckheaton.

B.S.A., Chater-Lea, Triumphs, J.A.P.'s, 1912 models; sidecars from 5 guineas; large stock of Michelin and Palmer tyres, accessories, accumulators, magnetos; accumulators recharged; petrol, Vacuum and Price's oils; sole agent for Lincoln Elks.—Pickles, Church St. Garage, Bradford.

NORTHERN Depot, Ltd., Everything Motorish, Leece St., Liverpool.—Auto-Carriers, commercial, delivery fortnight; Sociable, stock; 3-seater, 3 weeks; Kerry-Abingdons, clutch model, stock, other models week; Matchless, fortnight; Zebra 2-seater car, fortnight; special stockists F.R.S. lamps, Avon tyres, XPall saddles, Lyso belts, speedometers; all advertised goods in stock; sole agents celebrated Deluge motor suits; 14 oils stocked.

CHATER-LEA 3½h.p. J.A.P. Motor Cycle, complete with Chater-Lea spring forks, Cowey speed indicator, Lucas King of the Road lamp, 3-note horn, new Kempshall 26in. × 2¼in. tyre on back wheel, Rom tyre on front, pump and automatic drip feed lubrication, ignition by Bosch magneto, Matchless silencer, with cut-out, pedals, and footrests, toolbag in carrier, with side bag for spare belt and tube, machine in excellent condition, almost as new, winner of several important competitions; price £35.—Durant, Chapeltown, Sheffield.

GREAT Sale of motor cycles.—3½h.p. Rex, £7/10; 4h.p. Chater-Lea, magneto, spring forks, B. and B., £12; 3h.p. Triumph, £9; 1909 Douglas, £18/10; 1911 Kerry-Abingdon, £28; 5-6h.p. Rex, 1909, twin-cyl., free engine, and sidecar, £25, worth £40; 1908 Triumph, new condition, £25; P. and M., nearly new, 2-speed, free engine, £37/10; we have about 60 second hand motor bikes in stock, consisting of 1907, 1908, 1909, 1910 Triumphs, prices from £15; several Bradburys, Singers, Moto-Reves; all machines sold are warranted in good order; sidecars from 50/-.—The Motor Cycle Exchange, 160, Young St., Sheffield.

SECTION III.

Carnarvon, Denbigh, Flint, Cheshire, Derby Stafford, Shropshire, Montgomery, and Merioneth.

5h.p. A.J.S. Twin, in stock; 60 guineas.—Taylor Oakeswell, Wednesbury.

2½h.p. A.J.S., 2-speed delivered July, run about 400 miles, complete, lamp, horn, spares; £37.—Taylor Oakeswell, Wednesbury.

1911 2½h.p. A.J.S., belt drive, lamp, horn, spares, perfect order; £25.—Taylor, Oakeswell, Wednesbury.

A. J. STEVENS, 2¼h.p., 2-speed gear, free engine; immediate delivery, new; £42.—Below.

AIR Springs, Ltd., 3½h.p., in splendid condition, 1911 model, as new; any trial; £36.—W. G. Osborne, 35, Bridge Rd., Wellington, Salop.

1912 New Hudson; immediate delivery given. — M. Davies, Market St., Wellington, Salop.

TRIUMPH, 1908, good condition; seen by appointment.—Kendall, 11, Chichester St., Chester.

TRIUMPH, 1912, free engine model, just arrived unpacked; immediate delivery; £55.—Moss, Wem.

PHELON and Moore, 3½h.p. model, 2-speed gear and free engine, perfect condition; £38.—Moss, Wem.

1912 3½h.p. Zenith, variable gear, only ridden 20 miles; £50.—Motor House, Low Town, Bridgnorth.

1912 3½h.p. Zenith, new, in crate; cash offers wanted.—Box No. 9,854, *The Motor Cycle* Offices, Coventry.

1911 Humber 2-speed, machine, tyres, etc., as new; £36/10.—Andrews, Heage Rd., Ripley, Derbys.

TRIUMPH, 1911, standard, carefully kept and ridden, splendid condition; £37. — Brandon, 151, Welsh Row, Nantwich.

3½h.p. Rudge, free engine, new in November, with all spares; best offer.—Lloyd, Holmleigh, Craven Arms, Salop.

ROC 5h.p. Twin, 2-speed, free engine, enamelling and plating like new; £33.—9,859, *The Motor Cycle* Offices, Coventry.

RUDGE, T.T., July, 1911, very fast, winning mount, spares; £38; reason for sale, buying 1912 Rudge.—George Hill, Willenhall.

MOTOSACOCHE, 1911, 2½h.p., very little used, perfect order, lamp, horn, spare tyre, Palmer tyres; offers.—Dunphy, Welshpool.

NEW HUDSONS!!

These beautiful three-speed machines are making the twin-cylinder brigade "sit up."

COME AND HAVE A TRIAL SPIN.

We are Sole Agents for Halifax and Huddersfield and districts.

NEW 1912 MACHINES IN STOCK.

3½ h.p. **HUMBER**, 2-speed model	£52 10
1912 3½ h.p. **BRADBURY**, single-speed....	£48 0
1912 3½ h.p. **BRADBURY**, two speeds	£55 0
1912 3½ h.p. **NEW HUDSON**, three speeds	57 Gns
1912 2¾ h.p. **NEW HUDSON**, three speeds	47 Gns
1912 2½ h.p. **A.J.S.**, two speeds, chain drive	47 Gns

LIGHTWEIGHTS.

1¾ h.p. **WOLF**, A.J.S. engine, magneto ..	£15 0
2¾ h.p. **CASWELL** vertical, Bosch, Amac, h.b. control	£12 0
1910 2¾ h.p. **MOTO-REVE**, magneto, Druids	£22 0
1910 2¾ h.p. **MOTO-REVE**, extra fine order	£23 0
1909 2½ h.p. Twin **MOTO-REVE**, 50 × 70mm.	£20 0
1908 Twin **MOTO-REVE**, magneto Druids	£15 0

SINGLE-CYLINDER REXES.

1910 3½ h.p., fine goer	£27 0
1910 3½ h.p., extra good	£28 0
3½ h.p. 1909 Speed King, extra fine	£23 0
3 h.p. 1908 Featherweight Rex, Bosch mag	£17 0

TWIN-CYLINDER REXES.

1909 5-6 h.p. de Luxe, two speeds, fine ..	£34 0
1906 5-6 h.p. Twin Rex, Mabon clutch....	£16 10
5-6 h.p., Bosch, Lloyd's variable gear	£22 0
7 h.p. de Luxe, two speeds, M.O.V.....	£48 0
5-6 h.p. de Luxe, 1908, two-speed model..	£28 0
5-6 h.p. de Luxe, 1908, two speeds, special	£29 10
5-6 h.p. 1908 two-speed de Luxe, 1909 engine	£32 0

OTHER MAKES.

1911 Lady's **HOBART**, Armstrong 3-speed	£36 0
5-6 h.p. Four-cylinder **F.N.**, very good	£19 0
4½ h.p. **N.S.U.**, Bosch magneto, h.-b. control	£21 0
3½ h.p. **P. & M.**, late 1908, two speeds	£28 0
3¾ h.p. Twin **PREMIER**, fine machine	£25 0
3 h.p. **TRIUMPH**, M.O.V., h.-b. control ..	£17 0
5½ h.p. **N.S.U.**, 2 speeds and free engine....	£25 0
1911 2½ h.p. **MOTOSACOCHE**, magneto....	£27 0
1911 3½ h.p. **SINGER**, clutch model, done 200 miles	£43 0
3½ h.p. **L.M.C.**, 1910 model	£25 0
3 h.p. **SINGER**, Bosch, V belt drive, B.& B.	£16 0
3 h.p. **QUADRANT**, Bosch, B.& B., sp. forks	£16 0
3½ h.p. **MINERVA**, Bosch magneto, Amac	£22 0

SIDECAR COMBINATIONS.

5-6 h.p. Clutch Model **REX** and new sidecar	£29 0
5-6 h.p. Two-speed 1908 **REX** and sidecar	£33 0
7-9 h.p Two-speed **REX** and sidecar	£53 0

All fitted with Magneto and Spring Forks.

£3 DOWN SECURES ANY OF THESE. BALANCE 6/- WEEKLY.

3 h.p. **REX**, vertical engine	£9 0
3½ h.p. **BROWN Bicar**, M.O.V., 26in. wheels	£12 0

£4 DOWN SECURES ANY OF THESE. BALANCE 6/- WEEKLY.

5-6 h.p. Twin **REX**, splendid goer	£19 10

Consumption Comparisons.

ATTENTION is drawn in this issue to the increased cost of petrol, and although the price of fuel is not of so much consequence to motor cyclists as to autocarists, on account of the smaller quantities used by the former, it has an influence on the expense of the pastime.

While writing on this subject one is impelled to again refer to one of the unanswered questions relating to the running of motor cycle engines. It is general knowledge that, based on ton-miles per gallon, a motor cycle engine consumes approximately double the quantity of petrol for a given engine cubical capacity and weight that is burnt in a motor car engine. This abnormal difference in consumption has never been explained satisfactorily, and still remains a puzzle. If we take the average weight of a 3½ h.p. single-cylinder motor cycle of 85 × 88 mm. = 500 c.c. and its rider as 3 cwts., and that of a four-cylinder 15 h.p. car 80 × 120 mm. = 2,409 c.c. as 30 cwts. with passengers, we have a vehicle in the latter case of ten times the weight and nearly five times the cubical capacity of the motor cycle which will average twenty miles to the gallon. The consumption in the case of the motor cycle will be about one hundred miles to the gallon.

Various theories have been advanced to explain the difference, but none is satisfactory. In respect to carburation the motor cycle should be more economical, the design of its vaporiser is more settled, and on standard designs the twin lever control of throttle and air is admittedly superior to the single control on a car. It can hardly be due entirely to variation of gearing, because the average top gear ratio of motor cycle and car, allowing for the difference in wheel diameters, is not sufficiently great to account for the whole difference in consumption, though it may be responsible for a part. The absence of a change speed gear has been mentioned as the probable reason for the discrepancy, but motor cycles fitted with various multi-speed devices have been in use for years, yet greater economy in fuel consumption is not claimed by reason of their use.

Piston speeds in the case of the 3½ h.p. motor cycle and 15 h.p. car are about the same, and the piston speed of car engines is continually increasing. Can it be due to any difference in the ratio of weight and area to atmospheric resistance? For example, we will assume the total area of a motor bicycle and its rider travelling against the wind is nine square feet, and the area of the car and passengers which offers a resistance to the atmosphere as thirty square feet. Here we have a possible explanation because the power of the car, reckoned on engine cubical capacity, is nearly five times that of the bicycle, whilst the ratio of area to atmospheric resistance is only three and a third times more; against that there is the extra weight to consider, which is, in the case of the car, ten times greater. It might be argued that the greater volumetric efficiency of the car engine accounted for the difference, which would probably be correct if the increased volume were contained in one cylinder instead of being divided into four, in which case it can have no effect; the difference in size of the cylinder being quite insufficient to make much difference in fuel efficiency, *i.e.*, in consumption per brake horse-power hour. The subject is one of such interest that we invite readers' opinions on a problem which has baffled us from the earliest days of the pastime, and which has never been satisfactorily explained.

The Motor Cycle for Commercial Travellers.

DISCUSSION concerning motor cycles is now taking a prominent place amongst the *habitués* of the commercial hotels. After the day's work is finished, we gather round the smoking room fire, and the advantages and drawbacks of this modern method of locomotion form one of the chief topics of conversation. To-night we are in great force: there are four enthusiastic motor cyclists whose ardour has not been diminished even by the rawness of the winter air, the grease of the highway, nor the bumpy sets that form the roads of this "Never Never Land" they call Lancashire. It is absolutely the worst district I have to work, and I always send up a prayer of thankfulness when this week's journey is finished and I hie me away to the hills of North Wales. There the mountains take the place of huge chimneys, the birds' songs instead of the factory hooter, and a clear crisp atmosphere instead of the murky soot-laden air which our system of industrialism usually bestows upon the inhabitants of our manufacturing centres.

A Large Mileage.

The number of miles some of us cover in our week's work is surprising. One of the four here (Wigan) has just come up from Gloucester, and is contemplating a journey to Stockport, Glossop, and Sheffield to-morrow. I condole with him, as the experience of a rainstorm on the "Snake" is very fresh in my memory, and also those interminable tram lines that stretch practically all the way from Glossop to Wigan. I should like the pleasure of having the Chairman of the Roads Committee on my carrier through many important towns I wot of, and I am sure it would be to the good of the whole body of motor cyclists. A Rudge rider averages about 300 miles per week. I have covered 9,000 on my two-speed A.J.S. since April of last year, and my friend of the Triumph has a similar score. It will thus be seen that the Quarterly Trials, London to Edinburgh Run, and Six Days' Trials are great determiners as to choice of mount for the aspiring motor cycling traveller.

While we were discussing the merits and demerits of chain transmission an embryo Ananias joined in the conversation and told us that in the early days of the motor he had a trial run on a bicycle, and I cannot do better than use his words as near as I can remember. "I very well remember my first ride on a motor bicycle. I left Hanley on a prospective mount and I could not stop it until I reached Congleton, and then I fell off. After a rest I started back, and I tried to avoid running into a girl; she dodged and I dodged, but I at last ran into her. I was so exasperated that before I could think I had boxed her ears."

When we enquired as to make of machine and how it was controlled, he passed it off by saying he eventually bought the bicycle, and started once more to give us his further experiences, so we moved off in a body.

Last year's unrest among railway servants, and the fear of a further strike, caused many "Knights of the Road" to gather in catalogues, and considering that they number about 60,000 in these islands, it behoves manufacturers to consider their requirements. I have found a 2½ h.p. two-speed A.J.S., with its chain drive, an admirable mount for my use, but as I carry no luggage, beyond my bedroom kit, my experience would not benefit the other man with his hundredweight of samples. I should like to see makers a little more interested in mud and rain dodging fitments, as there is plenty of room for improvement in these things.

The utility of the motor bicycle for the business man is not the only point in its favour, the freedom

The "Cat and Fiddle" inn, between Buxton and Macclesfield, a favourite resort of motor cyclists during the summer months.

The "Cat and Fiddle" is generally supposed to be the highest public-house in England, but it is not so.

The Motor Cycle for Commercial Travellers.—

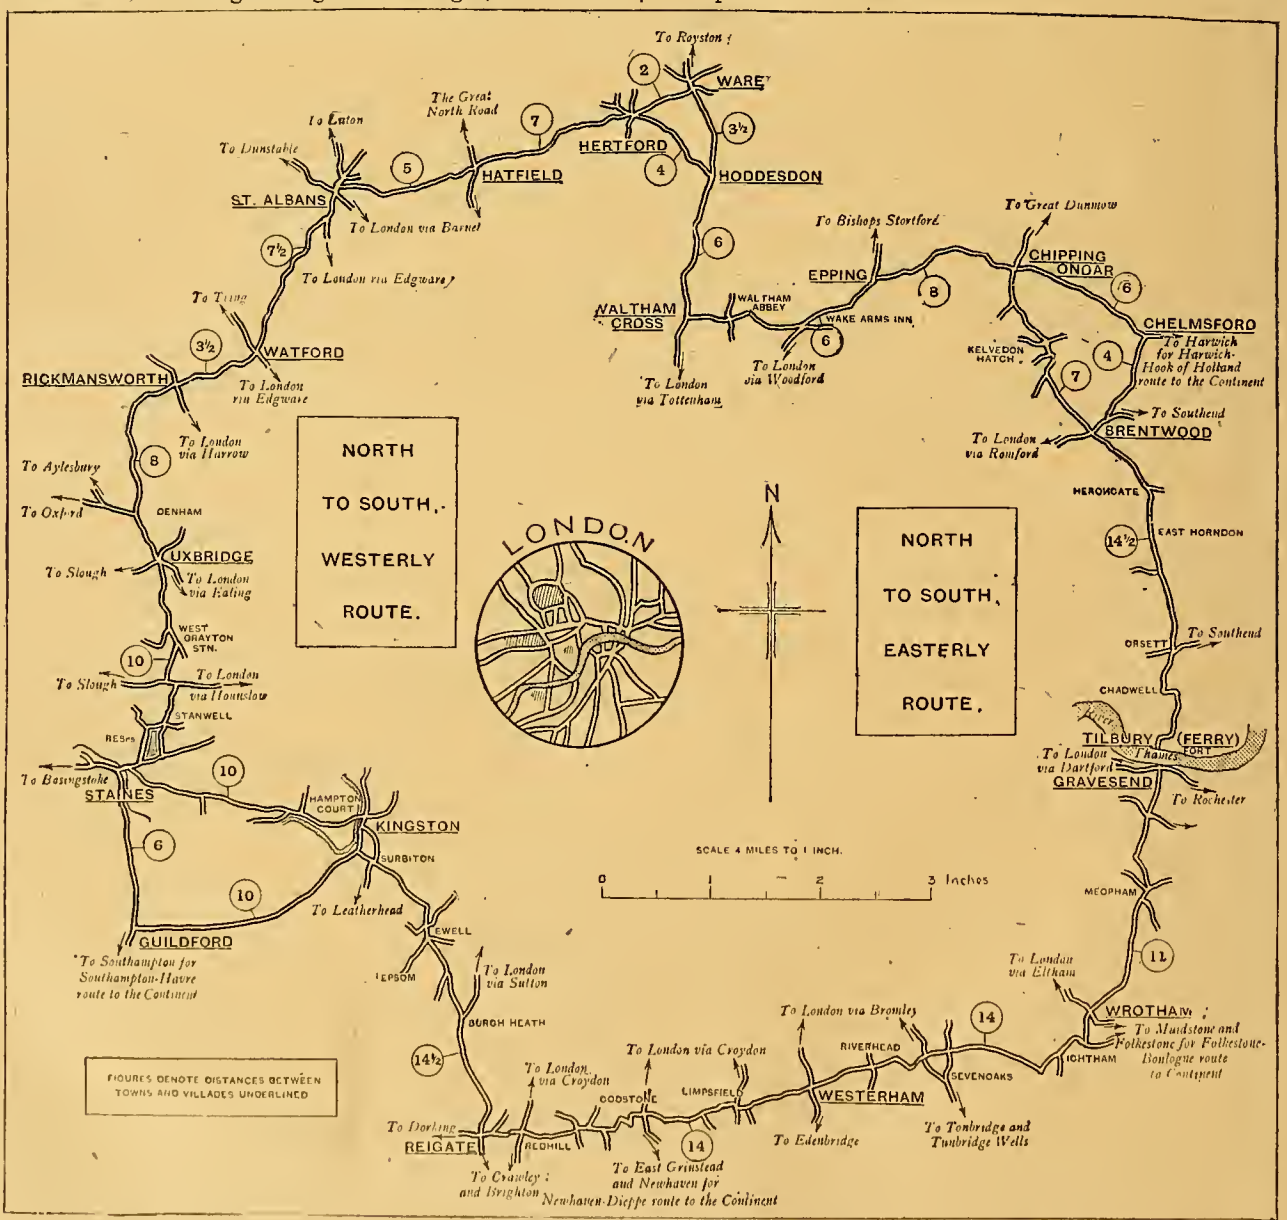
and delights of motor cyclists cannot be over-estimated. They have experiences and sensations unknown to the carist, inasmuch as the cycle becomes a part of oneself. The steering is not only conducted with hands and arms, but with the whole of your body. You feel the vibrating mechanism under you, a slave to your will. Mighty hills have no terrors, and the freedom of the bird is yours as you rush down into the valleys. The intimate feeling a man has for his bicycle was brought forcibly home to me when I left mine on a railway platform. I had just enjoyed a delicious skid which had prevented me from continuing by road. I felt quite sad at leaving my steed to follow me on the train. It perhaps was very sentimental, but most of our enjoyments have their basis in sentiment and not in reason. I have travelled thousands of miles in the train, by steamboat, and by motor car, but none of these have ever been so incorporated with myself as the motor cycle. It is no doubt this strange unifying process that makes the motor bicycle so very popular.

I have just finished a ride from Barnsley to Chester, and have enjoyed immensely the vagaries of a powerful wind. As I ascended and descended the long winding hills from Chesterfield through Buxton to Macclesfield, I had the wind first at my back, then directly in front on my right and on my left; in fact, these roads seem capable of causing a constant wind to blow in every conceivable direction. Climbing to the "Cat and Fiddle" it acted as an auxiliary to my engine, and I roared up the ascent; then its tactics changed, and it became my brake for the long descent into Macclesfield. It is on such roads as these that a motor bicycle emphasises the fact that it is a "gift of the gods." To the man who stores up his machine in the winter such pleasure is denied, for I aver that the exhilaration caused by a run in the face of a biting wind, or a fall of snow, when the natural forces seem to war against you, cannot be obtained when the summer sun is powerful and the mad winds of winter are changed into a caressing zephyr. Take out your bicycle, wrap up warmly, and taste the joys of winter motoring! R.F.P.

NEWSPAPER DISTRIBUTION.

THE motor cycle has, of course, been used for some time past for the collection of news, but it is only recently that it has been used for long distances, for the distribution of newspapers. The *Sportsman* having experienced difficulty in getting its papers through to Wales, there being no suitable train on the Sunday night to carry the Monday morning papers, the proprietors decided to experiment with a motor cycle and sidecar, and after several runs decided to establish a weekly service between their London office and Gloucester, where the papers are put on trains and sent to their various destinations, and it speaks well for the present day reliability of the motor cycle that the papers have always been up to time. The road to Gloucester is fairly difficult for a motor cycle with a sidecar loaded with about 300 lbs. dead weight, and I often feel the necessity for a change-speed gear, but at present have to be content with a fixed ratio. The roads during the past few months have been in a terrible condition, and on every run I have been expecting tyre trouble, but my Roms have not let me down, and I have found them a great safeguard against sideslip. My machine is a 6 h.p. J.A.P. with U.H. magneto. Whittle belt and Rom tyres, and a Dunkley sidecar is used.

Connecting up with the Train Service.



Every Sunday, about midnight, as soon as the *Sportsman* is off the press, it is rushed into the sidecar and away goes the machine. Every moment is of importance, for should the connection be lost the whole ride to Gloucester will be in vain. The route taken is through Piccadilly and Shepherd's Bush—where there is about a mile of what I should imagine must be the worst road in London. There is not much traffic about, except taxis and a few motor 'buses, and a fair speed can be indulged in, but a little farther on when well on the open road speed is the order of the day and the milestones slip by. Uxbridge is soon past, and nothing happens till I begin to look out for a rather stiff hill about a mile past West Wycombe. I am never confident of getting up here, for my engine is geared rather high to enable good speed to be made, but up to now I have managed to coax the engine up all right, although I usually sigh for a change-speed gear, without which no machine can really be called up-to-date. After this there is a long descent into Tetsworth, where a very fast run is made to Oxford and Cirencester, but the roads have been in a terrible state, two or three inches of mud being quite usual. From Cirencester to Gloucester is rather an anxious time until the papers are handed over to the railway authorities and another journey has been covered to the credit of the motor cycle. While the tanks are being refilled I have time for a wash and refreshment, then comes the return journey,

A motor cycle and sidecar regularly used for transporting newspapers from London to Gloucester.

Newspaper Distribution.—

which is quite a pleasant jaunt, for there is not the mental anxiety, and should anything go wrong I have time to put it right. In the intense cold, clothing is an important matter, and the hint published some time ago in *The Motor Cycle* I have found of service, viz., a pair of silk socks under a pair of football stockings to keep the feet warm, and a silk handkerchief between the neck and an ordinary linen collar to retain the heat of the body. For overalls I prefer the Burberry. I have found them waterproof after hours of rain, and their lined treble-breasted coat is also very warm. A short time ago I recollect a discussion in the columns of *The Motor Cycle re* the sooting of plugs, but this difficulty I have never experienced with the L.M. plug, although I give the engine liberal doses of oil. Riding throughout the night, it is hard to judge the rate of travelling, and one is apt to take corners at a dangerous speed, but since fitting a Jones speedometer this danger is overcome, and you can slow down to a safe speed when cornering. Riding in the fog is the only thing I object to; rain and snow are bad enough, but fog! I have not yet found a lamp that is any use in fog, and if any reader knows of one he will greatly oblige by letting me know. I do not think I have had any experiences worth relating, for beyond once seeing a tramp being searched by a constable I rarely meet anyone. I cannot conclude without a word of praise for the Whittle belt; at first I thought I should experience belt trouble, but it has gone through untouched in all weathers. It was only about a week before I started my weekly trip that I had ever driven a sidecar, and it is wonderful how simple it is to master. A.B.

HOW TO AVOID LONDON.

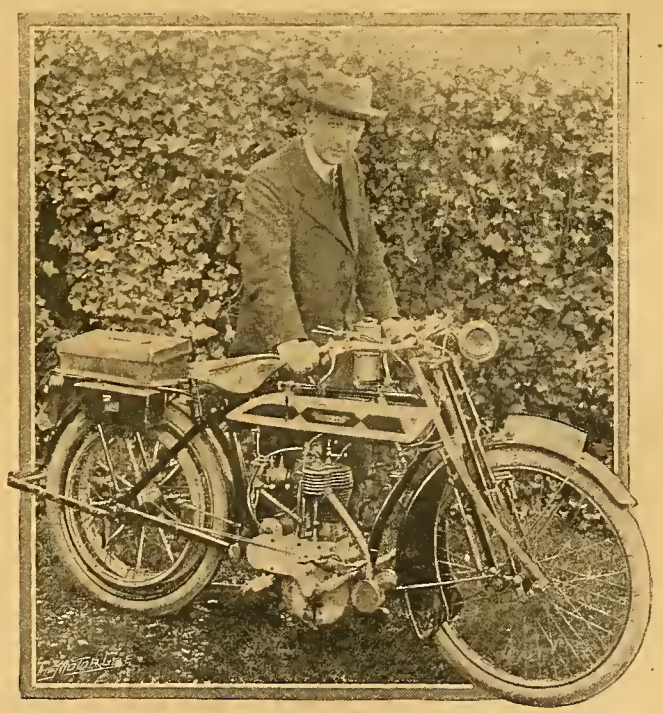
We are continually being asked how to avoid the traffic of the Metropolis by readers who wish to travel North, South, East, and West, and who do not wish to pass through the centre of London. The above map, which has been prepared from two sketch maps issued by the R.A.C. Touring Dept., shows how this can be done. Incidentally, the routes prove how the R.A.C. gives valuable road information to its members and associates, including members of the A.C.U.

Cyclecars.

The past history of the governing bodies as directors of the public vocabulary has not been at all encouraging and I doubt whether the latest effort is destined to enjoy a rosier future. New things demand new words, and the old brigade can well remember such attempts as "autocyclette," "autocyclist," "autocarist," and the like, many of which have passed into oblivion, while others survive as affectionate tokens to the age and standing of the long-established journals. The old company registers, bristling with such cacophonous designations as "The Great Horseless Carriage Company," show that the trade is as powerless and as poor a prophet in such respects as our governing body—even shrewd Hooydonk's "Trimo" is a dead word to-day. Is anybody seriously proposing to talk of "cyclecars" except on entry forms, and even then an intelligent nib will curl into a sneer? I prefer all the older words, such as "quadcar," "runabout," and "carette," for I notice that some users favour "tweeny car" at present.

The question is psychological, and I fancy the user of a quadcar will not greatly love any word which relegates his machine to the junior class, that is, to motor cycles. He will rather desire to present it as belonging to the motor car class, though he will be compelled to add a prefix or suffix which will distinguish it; and if a word can be found which implies that it is a car, and yet a great deal more sporting than the standard full-sized automobile, that is the word he will lick his tongue round most lovingly.

The Transmission Question.



A weatherproof transmission still represents my chief ambition. I get on very nicely indeed with two belts and a 4½ gear in dry weather and easy country; but set me to ride in a genuinely hilly country with a small pulley, and the belt alone can inspire me with a vindictive loathing for motor cycling and all its works, as the result of spending hours in pouring rain on steep gradients, and spending the night sixty miles short of my destination, with my hands grimed right through to the meaty parts. What is the trade doing? The one bright feature is the growing popularity of the counter-shaft transmission, which affords a big belt pulley half way along the drive, and indubitably reduces belt slip such as one experiences in heavy rain or when riding through pools of water.

The shaft drive is still confined to two or three machines, although it possesses the unique advantage of being encasable without making the machine look ugly.

Chain drive is well enough, provided the intrinsic harshness of the drive is softened down by a proper clutch or spring device, and each chain is provided with a simple and substantial adjustment; but how many machines fill this bill? Last year I rode several chain drivers; one of them possessed two chains with two adjustments, and both adjustments were cumbrous and finicky—so much so that I soon resolved to take my chances with a belt. The other shared one adjustment between two chains, and though workable, was oftentimes worrying.

I am very strongly of opinion that, pending more revolutionary innovations, it would be a great blessing if all the single-geared belt-drivers were converted to chain-cum-belt drive; if a ball bearing counter-shaft, carrying a large belt pulley (preferably adjustable), were inserted at the bottom bracket, and the drive from the engine to the counter-shaft were performed by a chain hidden in a neat aluminium case, resembling those now applied to magneto covers. I have tested this system exhaustively, and am convinced that it prolongs the life of a belt incredibly, that it very largely obviates belt slip due to wet weather, and that it entails only a microscopic loss of efficiency.

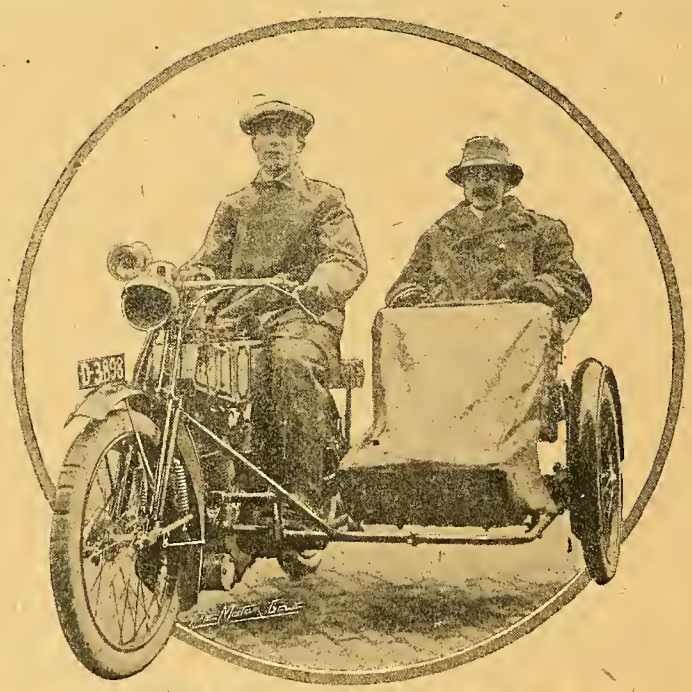
If it raise the first cost of a machine by a trifling sum, the user is repaid by the economies effected in his belt bill and the reduction of his road stoppages. The single-geared belt-driven machine is not a pleasant mount for a heavy rider in hilly counties in bad weather, and the above simple alteration is capable of transforming it under these very common conditions.

James St. John, trials hon. sec. of the Sutton Coldfield Automobile Club, and his 1912 model 3½ h.p. three-speed Quadrant. To Mr. St. John's organising ability the success of the recent Sutton Coldfield Reliability Trial, which attracted a record entry, is attributable. A paid secretary of the club having been elected, Mr. St. John will shortly retire from his post.

With a Bat Sidecar in the One-day Trial.

IN the recent one-day A.C.U. trial we had the good fortune to be allocated as observer to a Bat sidecar. Quite one of the first people we met at the Swan and Sugar Loaf (what on earth have swans to do with sugar loaves?) was Mr. T. H. Tessier. The machine, he said, is all right, but the sidecar is not much to talk about, and led the way to where the machine was drawn up by the side of the road. We could see nothing wrong with the sidecar, and, as events proved afterwards, it was most comfortable. Here we found Mr. S. T. Tessier, who was destined to take the Bat combination through the trial. We started about half an hour late, and the first part of the course was so easy as (except for the comfort of the machine and the quiet easy way it ticked along) to call for no remark.

It was at Polsteeple Hill that we got the first taste of the Bat's quality. You come on the hill rather unexpectedly, but the lie of the road affords a good run at it, and down hill, too: the trouble is a corner just at the foot. This corner, however, was not very sharp, and Mr. Tessier, jun., took a good rush at the hill looming formidably in front. We got round the bend at quite a reasonable speed, and once more the engine instantly responded to throttle and spark, and began fairly to roar round, almost before we were aware that the narrow road up the hill was choked with machines, their riders waving their arms violently and warningly for us to stop. So strongly was the machine running, in fact, that it had to be brought pretty sharply to a stand at only about one-fifth of the way up the hill. As far as could be gathered, some non-competitors travelling in front had got hung up on the hill, which is really very steep, with a bad and slippery road surface. Here we stayed a good many minutes until the traffic at the top was a little clearer, when down came an A.C.U. official, saying that all the machines had better go down to the bottom and start again.



"I'm not going down to the bottom," said young Tessier. "I've got here and I'll start from here."

"You will never get a machine to do that," returned the official.

"Oh! can't I?" said Tessier. "Well, I'm going to try, anyway."

We got aboard, the engine roared free, then in went the low speed, and we started. The surface was bad enough at first, and as the machine picked up speed the riding was by no means improved by the fact that the other machines lying along the side of the narrow lane at times almost forced us into the gutter. Higher up, on the steepest part, the difficulties were increased by the slippery clayey soil, and several times the trusty Dunlop driving tyre began to slip; in fact, it was a wonder that it gripped the road at all, considering the steepness of the hill and the speed at which the machine was being driven; possibly the fact that it was a large one—voiturette size—helped matters. Though on low speed all the way up, we seemed to be fairly flying along, and we looked upon it as a great performance, although our job on this occasion only consisted of sitting still and holding tight.

Close to the very top of Polsteeple Hill there is a sharp bend, and here we found a pony cart on the one side, with a passenger machine carefully disposed on the other, necessitating an instantaneous declutch and brake application, such was our speed. The tricar machine was quickly shifted a foot or two, and we slipped by and passed on.

The 8 h.p. Twin Bat-Jap and sidecar driven by S. T. Tessier in the A.C.U. One-day Trial.

Through lovely country our route lay over hill and dale, until down a winding lane we saw Cudham Hill lying ahead. This was the first of the timed hill-climbs.

The road up to Cudham affords a very fair rush at the hill, owing to its straightness, but the quality of its surface is anything but conducive to speed. As soon as we got on to the straight, once more the engine was opened up, and we tore full tilt past the lower timekeeper, with all the engine's 8 h.p., and a good bit over, we should say, working for all it was worth. Over the rough, slimy surface of the clayey road we rocked and bounded faster and faster. It was quite exhilarating. Up and up we went, with never a falter or suggestion of changing down, while the way the speed kept up in face of the hill was quite remarkable.

Then came the corner, and the steepest part of all, and here the usual ubiquitous obstructionist in the shape of a motor cyclist who had not drawn into the side, brought the clutch out and an instant slowing down; otherwise we really believe the machine would have done it on top.

After that, in common with the official car that was indicating the route, we lost our way, and before we had done the seventy-two miles to Tunbridge Wells (where we had lunch), as indicated on the route card, we had done an extra six and a half miles goose-chasing on wrong roads.

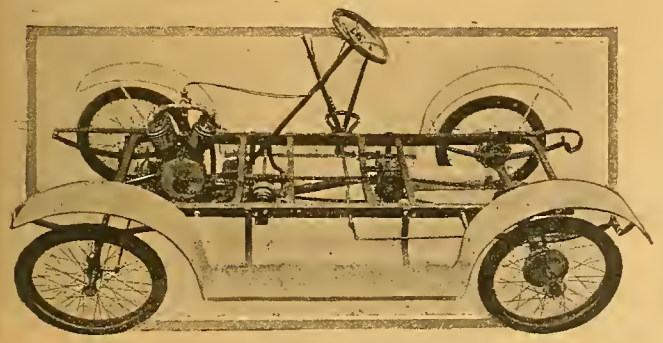
With a Bat Sidecar in the One-day Trial.—

After lunch there was nothing in the way of hills that were worth mentioning with such a mount as ours until long after the rain had started to descend. After Leith Hill there was a narrow lane of villainous surface with ruts inches deep; and here we had another example of the Bat's capacities. Its previous performances had been more of the dashing and brilliant order, but on this hill the track was so narrow that it was impossible to get past the machines ahead of us, and so we had to force our way up at the speed of the slowest competitor by sheer engine power. Although this was nothing like as fine a performance as at Polsteeple and Cudham, it was good enough to do credit to any machine.

Then came the rain. How it poured! Night set in, and once more we lost our way, and pelted through unknown lanes with every drop of rain that struck one's face stinging as though it had been the outcome of the pea-shooter of our schoolboy days. Finally, we found ourselves at Dorking, in company with some fourteen other motor cyclists. After that any attempt to follow the route would have been ludicrous, so we made as straight as we knew how for Croydon.

By the by, from Dorking we took a third passenger sitting on the carrier, but his weight seemed to make no appreciable difference to the J.A.P. engine, which roared along just the same.

It is true that the qualities of the Bat chain-driven sidecar combination were drawn out to the fullest extent by Tessier's very fine handling, but even discounting this, the Bat is, to our mind, a quite remarkable machine.



AN EXCITING MOMENT IN THE ONE-DAY TRIAL.

Climoing a 1 in 4 gradient. Success in climbing an exceptional hill with a sidecar frequently rests with the sporting propensities of the passengers. For instance, the lady passenger depicted above has seated herself on the top of the apron with the object of springing out should the machine come to a standstill; further, by leaning towards the bicycle, she is doing her utmost to prevent the back wheel slipping in the grease.

ANOTHER LIGHT RUNABOUT.

The Autocrat is another of the runabout machines of the cyclecar class which is being marketed by the Autocrat Light Car Co., Gough Road, Birmingham. The engine is a twin-cylinder air-cooled Peugeot, the transmission being by chains to a disc clutch on the counter-shaft, from the counter-shaft to the gear box, and thence to a differentially geared back axle. The frame is of pressed steel fitted with semi-elliptical springs fore and aft. The gear box has three speeds, and the brakes act on drums fitted to the back wheel hubs The wheels are 26in. × 2½in. shod with Clipper tyres. The chassis weight is about 6 cwts., the wheelbase 7ft., and the track 3ft. 8in.

Chassis of the 7-9 h.p. Autocrat cyclecar. The motive power is a V twin Peugeot engine, and the transmission is by chain.

FURTHER NOTES ON LUBRICATION.

My notes last week on existing lubricating systems and the possibilities of improved methods have brought me a letter from Messrs. Best and Lloyd. To supplant the old type of pump by the Best combination of pump and drip would certainly be a great advance, but even so we are a long way from the pressure fed system for which I pleaded.

My statement that with drip feed the feed is only by gravity is objected to, as in the case of the Best there is a mechanically forced drip. My point was that the pump maintained a clear oilway and ensured the oil reaching the crank case, while the drip dependent only upon gravity makes choking of the oil lead more likely. The Best system may be forced as far as the drip, but thereafter it is by gravity as in other cases. Certainly by opening the regulator we can pump right through, but in so doing must fill the sight-feed, thereafter leaving it in such state as makes it difficult to justify its name. Certainly I have no objection to the drip feed, but I do not regard any hand pump and drip combination as representing finality in motor cycle lubrication. CYCLOPS.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Driving Licences.

Sir,—Referring to the paragraph in "Current Chat," page 147, like "N.S.U.," I also possess a driving licence issued to me by a county authority other than the county I am living in. KING DICK.

A Simple Form of Quadcar.

Sir,—In my last communication I made reference to an offer I had had made to construct a light runabout for £50. I have had some correspondence on this matter, mostly dubious as to its possibilities as a commercial proposition. I may say that this offer was not made under the impression that the machines could be supplied to all and sundry at the price mentioned, but was merely applicable to myself. Thanking you for finding space for my last letter and hoping you will be able to insert this, P. TAYLOR.

Red Rear Lights in Hampshire.

Sir,—I see on page 173 of your issue of February 15th, you mention Hampshire as being one of the counties which has set the example of requiring red rear lights on all vehicles. Is there not some mistake here? for, with the exception of steam and petrol driven vehicles, I have seen very very few (if any) red rear lights on the road in Hampshire, and it makes very dangerous travelling for us motor cyclists, especially if our machines are fitted with good silencers. Horse drivers cannot then hear our engines, and we cannot see them, especially in some of the darkest parts of the New Forest and other wooded districts. C. PARKES.

[The byelaw to which reference was made on page 173 of the issue of the 15th ult. was adopted by the County Council of the administrative county of Southampton on November 13th, 1911.—ED.]

Two-stroke Engines and A.C.U. Formula.

Sir,—Referring to last year's results of open hill-climbing competitions, it will, I am sure, interest the riders of the Scott and other two-stroke engines to find not one hill competition has been won by a Scott. Why? The A.C.U. is the authority which is responsible for the formula, and which is supposed thoroughly to investigate before imposing a handicap of any description for the year. The experts are evidently satisfied. I find they have stuck to the unfair divisor of 1.32 for 1912

The makers of the Scott machine seem to delight in it, making an excellent epistle in their 1912 catalogue, proving by a well-aranged diagram that the A.C.U. assumes the two-stroke Scott engine to be double the power of the ordinary engine, and that the Scott riders are on equal terms in competitions with the 5 and 6 h.p. machines of other makes.

I would like to know through your paper from the A.C.U. secretary or any other secretary if they consider the above a fair and just handicap for 1912 after the results of 1911. I do think the A.C.U. might allow a little consideration to the riders (who are possibly its supporters), and give them a sporting chance by a reasonable handicap.

I have been informed that the Scott riders have given up all hopes in competitions, and are not likely to enter for the Westmorland M.C.C.'s hill contests at Brigsteer Brow on Easter Monday. The A.C.U. maintains it assists its members under difficulties. Perhaps it will commence here for a start, and place the Scott competitors on a reasonable sporting footing with other riders, so that they can again join the ranks of competitors, or bar the machine and be done with it. FAIR PLAY.

A Locally Made Foot Starter.

Sir,—I notice in your issue of February 29th, a query from a correspondent signing himself "V.C.," relating to the possibility of fitting a foot starter to a Zenith-Gradua machine.

With the aid of a local engineer I have had this done to an 8 h.p. 1912 model, with considerable success. A larger half-time shaft was procured from the J.A.P. Co. (who, apparently, stock these), and this was allowed to extend through the timing casing far enough to admit of a free-wheel clutch being fitted to it. Then the usual stand bracket was fitted with a pedal, sprocket, and chain wheel on the right-hand side, and a spring to keep the said pedal always in an almost vertical position when not in use. The addition of a standard Ukantes stand and the alteration of the brake pedal to the front footrest were the only other necessary alterations.

In practice the device works extraordinarily well, and as, I believe, most people usually make use of their free engine for starting and stopping whenever possible, it entails very little more wear on the belt. The gear from pedal to engine is 3 to 1, which renders it possible to kick the engine over compression even when quite cold.

C. GERALD BROCKLEBANK.

How to Exhibit a Badge.

Sir,—I enclose herewith a photograph showing the method which I employ for this purpose. It is a modification of the arrangement suggested by Thos. E. Hampton in your last issue. The top of the badge is attached to the front of the number plate, so that these mutually support one another.

H. R. S. WALFORD.

H. R. S. Walford's method of exhibiting a badge.

The Design of Cyclecars.

Sir,—I have noticed lately that the cyclecar is making itself known very surely. But I, as others, think it must be made as cheap and simple as possible. Now the transmission is a vital part in this question; that being so, why not do away with chains, shafts, gears, differentials, and the two outside belts, and necessary pulleys and counter-shaft?

I make the suggestion of having a straight through drive from the engine to the back axle by means of a *wide*, long, flat belt. This is a simple and efficient drive.

As regards the differential, let the back pulley be split in the centre, making two pulleys, so that when the car is rounding a corner the belt would slightly slip on one half. Here there would not be so much friction as with separate belts slipping in V grooves.

As regards gears, let there be a jockey pulley, which would be raised or lowered by means of a lever on the steering column, making a sort of clutch and gear combined, so that when starting up the belt would be slack and

when starting off the belt would gently draw tight, making a smooth send-off. This type of drive is as old as the hills, but nevertheless it would be an efficient one for a light car, bearing in mind to have a wide and long belt, a jockey pulley, and engine and back axle pulley flanged.

W. J. STEVENS.

Suggested Route for the Six Days' Trials.

Sir,—I am glad to see that the secretary of the Torbay M.C.C. has written in the name of himself and his fellow members, thoroughly endorsing the opinions already expressed on the Ashburton-Tavistock route. To appreciate fully this route, I think it is "essential" that it be traversed both ways, and I fancy that he would agree with me in this. With Taunton as a starting point, this could easily be arranged.

That Mr. Powell exactly locates the corner speaks well for "H.P.B.'s" map; the bridge mentioned is Holne Bridge. Mr. Powell's description is a very good one. Even if geared low, and knowing the corner well, it is very difficult to negotiate.

There is another corner on this route near the signpost marked Leusdon Cross, and about a quarter of a mile on the Ashburton side thereof; the corner is exceptional even for Devonshire, and is met very suddenly. Both corners if taken very "wide" indeed have a gradient of about 1 in 5 or 1 in 5½, and both are, I fancy, "banked" the wrong way.

Can anyone say how the hills on this route compare with, say, Arms Hill, or any of the well-known hills on which climbing competitions are held? T1111.

The Agency Question.

Sir,—I think the following is a state of affairs that ought to be done away with.

I am desirous of purchasing a certain motor cycle. My local agent, being only a small man, is unable to take my machine in part payment, and as I found the demand for my machine not at all good, I applied to one of the large advertising firms whose advertisements appear in *The Motor Cycle*. This firm say they will be pleased to supply me with the machine that I want, and take my old mount in part payment. My agent now says that if I buy the particular make of machine from anyone other than himself, he will call upon the firm to give him 5%. Now the firm I want to buy from say they will not pay this percentage, or any other, so that between the two of them I have to do without that particular machine. Surely this is carrying the agency question much too far. I consider that if a firm has given a monopoly to one man, it should see that he is financially able to conduct his business in a proper manner, or let someone else do it for him.

A friend of mine is also desirous of buying a machine of another make, and his trouble is this: The agent cannot deliver until June, and therefore he has to do without a machine until that month, and yet he sees the large firms advertising the same machine week by week.

The above are the examples of what the agency question has come to, and I shall be glad to know the views of other riders on the matter, as I contend that if I feel sufficiently interested to go to a town to buy a machine where a firm has it to sell, I should be allowed to buy it in the ordinary way, and that no restriction of any kind ought to placed on my actions or that of the firm which has the machine to sell which I am in want of.

The whole affair looks like assisting the small agent at the expense of the smart up-to-date advertising firms.

WILLIAM TOPPING.

Cycle Passenger Attachments.

Sir,—In your issue of the 15th ult., a correspondent, "C.D.," makes mention of a novel passenger attachment suitable for owners of lightweight motor cycles. Strange to say, his suggestions are almost exactly embodied in a type of sidecar which I have been using (often with a 28 lb. weight for passenger) during the past three winter months.

Briefly, it consists of a lady's strong cycle frame with front wheel and forks removed, a motor cycle wheel (size 26in. × 2 in.) behind, a Brooks motor saddle (with back rest) set well back on an extended saddle pillar, and the whole is attached to the motor cycle by two main stays, supported by three auxiliaries, all held fast by quickly detachable Chater-Lea joints.

Now let me shortly enumerate what I have proved to be points of real merit in a sidecar of this design.

1. It is light, weighing less than half the average ordinary sidecar.
2. Wind resistance with it is reduced to a minimum.
3. Starting is made exceedingly easy, and even very steep hills lose their terror because the passenger can pedal, which assists the engine wonderfully.
4. It is thoroughly safe and entirely free from side-slip.
5. The side strain is very slight, as each wheel supports its own rider.
6. It costs less than the ordinary sidecar, besides being an economy in belts and tyres.
7. The width is much narrower than in the case of the chair-car, and still the tendency to tilt is not so great.
8. Vibration with a 2¼in. tyre is scarcely felt, while the steering of the motor is not a bit affected. To prove this, I have covered long straight stretches without holding the handle-bar at all.

I am convinced that a future is in store for a passenger attachment of this type when once its many merits are made known A.L.

P.S.—The designer's name is Mr. Campbell. The makers intend to fit a V-shaped shield to the front of their next model, which will also, I am informed, be supplied with collapsable footboards and a bucket seat. A friend and I are planning a day's outing with the side-bicycle and a 1910 single-geared Triumph. We shall send you photographs of the unique combination, and perhaps a description of the run.—A.L.

Pillion Seats.

Sir,—Being an interested reader of your paper, the first thing I noticed in the issue of February 22nd was the photograph on page 209. I should like to tell you that my wife and I travelled about 3,000 miles last season in the way depicted by the photograph enclosed, which was taken in North Wilts while on tour last August. I must say we both much prefer it to the sidecar, which we only use when the roads are wet. We tried the sideways seat first, but I found the passenger interfere with the steering when going round

Photograph accompanying Mr. Bowditch's letter.

corners. You will see by the photograph how my wife sits, and will note the leather wheelguards which are strapped on. The footrests are on the stand, and my wife sits on a special air cushion. We are both longing for the time to come when the roads will be in a fit state for us to travel safely in the same old way. I was afraid it would pull about the back wheel, but the machine—a 1910 Kerry-Abingdon—never gave the slightest trouble throughout the whole distance, not even a choked jet E. J. BOWDITCH.

Clutches and Variable Gears.

Sir,—I was much amused by the photograph you published on page 254A in your issue of March 7th, representing a Mr Frasetti and his sidecar stuck on Cudham Church Hill because of "over-gearing." As the name is uncommon, I suppose this is the same Mr. Frasetti who a few months ago wrote frequently to your correspondence columns asserting that the free engine clutch on his machine was so efficient as to equal an infinitely variable gear. I notice he is still riding the same make of machine, and should be interested to know whether he still considers a free engine capable of serving as an infinitely variable gear, or whether the clutch of the 1912 models is not quite such a miracle as that fitted in 1911.

COMMONSENSE.

Cost of Motor Cycling.

Sir,—In his cycling notes in the *Sunday Chronicle* a contributor again refers to the cost of motor cycling, and reasserts that the sport demand an annual outlay of £50 and a continuous expenditure of 10s. a week. If this be so this writer must be correct in stating that the pastime is beyond the reach of the "working lad."

Most motor cyclists, I think, will agree that his assertion is misleading. If one buys a motor cycle for, say, £55, and after a year's running sells again, one would find oneself out of pocket equivalent to a sum certainly equal to 10s. per week. This would, however, include the capital outlay. On the other hand, if one were to buy a good second-hand machine, say for £25, and after running for a couple of years one were to sell the weekly cost would average something like 5s. per week, this, again, inclusive of capital outlay. I am not putting anything to credit for train fares saved, and I am presuming one has a reasonable amount of luck with tyres.

The above figures would, to my mind, cover a greater mileage than the average motor cycle travels. The *Sunday Chronicle* writer is undoubtedly happy in singing the praises of the ordinary bicycle. His reference to the "skilled mechanic" leads me to believe he is not a motor cyclist, as this myth has been exploded long ago.

With reference to "R.M.B.J.'s" letter in a recent issue, I echo his wish that you publish more accounts of tours. I find them most fascinating reading. J.L.

A.C.U. and M.C.P.A. Committees.

Sir,—Permit me to reply to Mr. E. P. Harding's letter in the issue of March 7th. Apparently, Mr. Harding belongs to that unhappy class which is incapable of crediting the opposition with the same honesty of purpose and singleness of aim which he claims for its own members. I am sorry to think so, but his references to masked intentions, etc., force one to that view.

Let me assure him that the M.C.P.A., whether its methods be right or wrong, at all events, has only one object in view, viz., to strengthen and improve the A.C.U. The formation of the M.C.P.A. is due to the efforts of a "private member"—Mr. Brown—and not to members of the trade. I have accepted the office of chairman (at least, for the present) because I am anxious to make the A.C.U. a really progressive, active body, in touch and sympathy with the motor cyclists of the kingdom, and for no other reason.

The sometimes maligned "trade" is capable of taking care of itself. It does not need the M.C.P.A. to further its interests, nor would I remain chairman if it did. On the other hand, it seems folly to refuse the services of active and keen motor cyclists merely for the reason that they are connected with the trade. We want all keen men to join us. There is no reason to fear that "the trade" will overwhelm us as a consequence. As a matter of fact, the leading members quite realise that the A.C.U. should be governed mainly by others than themselves. They want adequate representation no doubt. Surely the right policy is for the trade and the private members to work together for the good of the cause, with the balance of power, so far as A.C.U. matters are concerned, in the hands of the latter. If the M.C.P.A. members be elected to the committee I believe we shall attain that end.

Mr. Harding writes as a vice-chairman of the A.C.U., who has "served upon the committee for several years." He cannot be very proud of the results of his labour when he reflects upon the present position of the A.C.U. and its chaotic organisation as illustrated by the fiasco of the Spring Trial on March 2nd. We all know that it is easier to criticise than create—easier to pull down than to build up—but that knowledge must not prevent us taking any action at all in present circumstances. "He who criticises is my friend; he who flatters is my enemy." I do not intend to flatter Mr. Harding! I hope he will regard me as a friend! We all know he has given much time to the A.C.U., and it may be he is suffering for the sins of others.

The private members to whom he appealed appear to think that we are on the right lines, judging from the result of the election on Thursday. The affiliated clubs we hope will follow their example.

With regard to the other letter signed "Individual Member," your comment expresses our view exactly.

OTTO THOMAS, Chairman M.C.P.A.

Ball and Plain Bearings.

Sir,— The above subject is undoubtedly of great interest, and from twelve years' practical experience I draw the following conclusions: Take the case of the present fashionable main shaft ball bearings as against the plain bearing. The former is more easily replaced than the latter owing to that fact that no wear takes place on the main shafts. The ball bearing also retains oil better and facilitates neat crankcase casting, no outside bearing bosses being necessary. Also the main shaft may be stout and short, giving great strength where most necessary; on the other hand, the ball bearing soon develops a slackness, which cannot be adjusted. This slackness gives rise to the rumbling sound so often emitted from worn engines with this type of bearing, and no adjustment being provided the only remedy is to fit two new bearings—an expensive item in themselves—apart from taking engine down and fitting up again. The case for the plain bearing may be stated thus: Engines fitted with plain bearings run quieter, due to the better cushioning effect obtained on the firing stroke. Less wear takes place, provided the bearing be properly proportioned and lubricated, and the cost of the bearings (bushes) themselves is infinitesimal. Regarding the replacement of worn plain bearings, the cost may vary considerably, as wear also takes place on the shafts, no matter how carefully they be hardened. The latter remark also applies to crank and gudgeon pins on which wear in the best engines is very noticeable. This wear is not always true, and in fitting new bearings or bushes it may be necessary to grind or turn the shafts circular again to a slightly reduced diameter. To obtain perfect results from plain bearings they should be long and project as far as possible inside the crank case. The main shafts should be of as small a diameter as possible consistent with safety, and the system of conveying oil to the bearing should be improved. MAIN SHAFT.

A FAMILY SIDECAR.

Dr. J. A. R. Lee, of Mexborough sends us the above interesting photograph of a Rover and sidecar. Incidentally, he mentions that he uses his machine every day, and up to the present it has given entire satisfaction.

Necessity the Mother of Invention.

Sir,—Dr. Selby Clare assures us that the exhaust gases emitted from his silencer are nearly cold, and he does not think my suggested method of thawing the generator there, would have the desired effect. Should the doctor be able to hold his hand over the silencer holes for a couple of minutes with the engine firing it would be interesting to your readers to have particulars of his engine, exhaust pipe, and silencer.

We are all striving for a cool exhaust and would be pleased with anything under 100° Fahr. from a 3½ h.p. motor cycle run at the usual speed on the stand. The doctor's "patient" if subjected to that temperature (100°) would have a speedy recovery, I have no doubt. J. B. DALL.

Evolution of Engine Timing.

Sir,—Regarding the article "The Evolution of Engine Timing," your contributor mentions Mr. F. W. Applebee as being the person to remove the drain tap to get up Birdlip in 1906. He is mistaken. It was I that opened the drain tap on my 2¼ h.p. 70 × 80 mm. Kerry, and, moreover, I got up the hill, and my weight being over 12 stones, and the machine 198 lbs., it was not a bad performance. What would present day motor cyclists think if given a 70 × 80 engine, single gear, and told to weight it to 366 lbs., and get up Birdlip? Yet we constantly read of the great improvements and efficiency of present day engines. G. ALDINGTON.

A.C.U. One-day Trial.

Sir,—You have given notice in your paper of a lamentable muddle that was made of the A.C.U. one-day trial. We had ourselves kept out of these trials for some years, as we considered that there were too many of them held, but when the A.C.U. agreed to reduce the number to two per year we thought that we were justified in re-entering.

After going to the expense of this it is extremely annoying to find that, owing to the lack of proper management, the whole trial was abandoned, and the A.C.U. simply offer to return the entrance frees, or give another trial. Under these circumstances we have asked them to return our entrance fees, as we have no intention of competing in any further trials, unless they make some great difference in their management.

Our machine was doing remarkably well, and would have probably been one of the very few that would have made a non-stop run.

We trust you will insert this letter, as we should like the reason known why we do not enter these trials. We gave them our support for many years, but reluctantly have come to the conclusion that owing to their bad management they are now of no further use.

BROWN BROTHERS, LIMITED.
R. B. BANKS.

Inclined Engines.

Sir,—The cooling effectiveness of horizontal or inclined radiators is a subject of interest. Without any definite data upon the subject, I should imagine that horizontal radiators would be more effective than the inclined. The advocates of the latter base their arguments upon the fact that the faces of the radiators meet the air with greater force, and for that reason part with more heat, but they appear to overlook the fact that only one side of the radiator fin would be impinged upon, the other side being possibly in a partial vacuum. I am of the opinion that as a matter of fact there is a smaller amount of air circulating between the radiators of the inclined than the horizontal, and that effective cooling depends more largely upon the quantity of air brought into contact than upon the pressure. In any case the difference in heat transmission of an engine with radiators set at an angle or horizontal would be so small as to be almost negligible in its effects upon the efficiency or power of an engine, and not to be compared with the effects of other differences of design.

JAS. L. NORTON.

Sir,—May I trespass on your space to reply to Mr. Wells's letter of the 7th inst. Mr Wells has, I am afraid, made a mistake in surmising that I have any connection with the firms mentioned in my previous letter (15th ult.).

Unfortunately, I have none whatever, nor am I in any way connected with the trade.

The P. and M. and the Motosacoche were mentioned merely as examples of machines having, in my opinion, a better engine-position than that machine with which Mr. Wells is connected.

I am sure there are many others besides myself who would be pleased to read Mr. Wells's replies to my queries.

Since I am not in the trade, my name will be of no interest to that gentleman, and it will, therefore, be sufficient to sign myself VERTICAL.

Electric Lighting for Motor Cycles.

Sir,—I thought my opinion of the Voltalite dynamo might be of some use to your readers. I find that it does not give quite enough light for a motor cycle; the rubber ring on the pulley also wears out rather quickly. There is one mistake which Mr. Aston makes in his article. He says that "When the speed of the armature is increased the voltage remains the same and the current rises. It is the voltage which rises (since more lines of force are cut by the wire on the armature), and the current rises only a very little. KEITH CHARSLEY.

[The statement in the article in question was made in error, and our correspondent's correction is quite right. It is the voltage which rises, and a lamp is used which is able to take the increased pressure of current without damage.—ED.]

The Air Injection Principle.

Sir,—*Re* letter from "H.A.F." in your issue of February 29th on the subject of injecting air into exhaust gases, your correspondent is I think under a misapprehension as to the object aimed at in doing this. He assumes that the rush of air from the frame A (in his diagram p. 221) would help the gases out of the exhaust pipe. To do this, however, the incoming air would have to move faster than the exhaust gases—a thing hardly possible, considering the extremely high velocity of these gases.

On the contrary, such an appliance would cause considerable back pressure, especially when travelling slowly. For it is obvious that the gases rushing past the open end of the air tube E would exert a high air suction in the tube, thus diminishing their kinetic energy. For kinetic energy being imparted by the gases to the air, in order to make their velocities equal, it is clear this would leave less kinetic energy in the gases themselves—in other words, there would be back pressure.

I believe the common theory as to injecting cold air is that it cools the gases and so reduces their volume. This however is a fallacy. First it is extremely difficult to think of any method of injecting cold air without causing back pressure, but even if this could be done, that is to say, if the air could be injected at the same velocity as the exhaust gases are moving at, it would not diminish the total volume of gas in the exhaust pipe but increase it. We would then have an increased volume of gas, moving at the same velocity, and hence there would be additional back pressure.

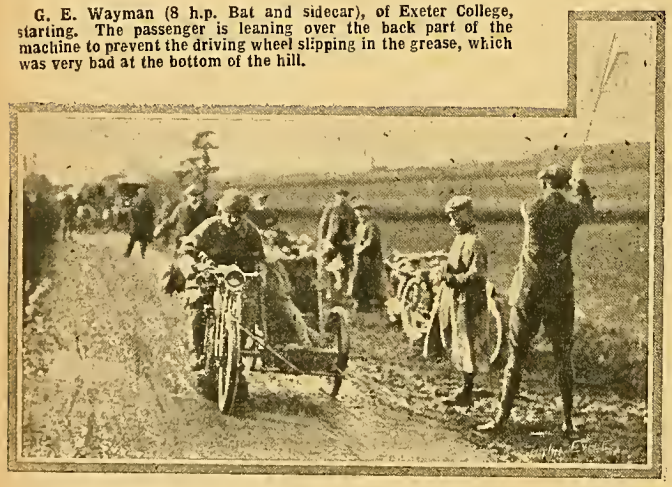
I hope this will make it clear that the cold air injection principle is quite useless in any form. I must apologise for such a lengthy letter, but considering the number of people who are wasting time and money experimenting in this direction, you will, I hope, find room to publish.

H. R. MEREDITH.

SUMMARY OF CORRESPONDENCE.

H. C. Mills (3½ h.p. Premier), a competitor in the One Day Trial, writes: "I notice in your report you have me down as having failed on Cudham Hill. This is quite a mistake, as I took all the hills on the course without failing on one."

We are informed that Cyril C. Paterson is riding a 2¾ h.p. M.R. in the M.C.C. Land's End and back run and not a 2¾ h.p. Enfield as stated in the list of entries published last week.



LOST AND FOUND.

We receive many letters regarding accessories, etc., both "Lost and Found," which we are unable to find space for. As these particular matters are of interest to two persons only, viz., the finder and the loser, we keep a list of such articles, and, should we receive a letter from the finder which corresponds to the article lost, the two persons are put into communication.

Oxford University M.C.C. Hill-climbing Competition.

THE O.U.M.C.C. held a very successful hill-climb at Horsepath Hill, about five miles away from the city, in the direction of Wheatley. The hill chosen was dead straight and the gradient was not severe, being as near as we could judge about 1 in 10. There was, however, a slight wind blowing down the hill, and near the start the surface was very greasy and dangerous. The results, which are given on next page, were decided on the following formula:

$$\frac{(\text{bore})^2 \times \text{stroke} \times \text{No. of cyls.} \times .9 \times (\text{time})^2}{\text{weight.}}$$

G. E. Wayman (8 h.p. Bat and sidecar), of Exeter College, starting. The passenger is leaning over the back part of the machine to prevent the driving wheel slipping in the grease, which was very bad at the bottom of the hill.

In Class I. G. K. Pippet made a fine ascent on his 2½ h.p. Singer.

In Class II. for touring singles the performances were fair but not in any way startling. Wyley, on a 3½ h.p. Rover, made fastest time, but came out third on formula, being beaten by Wayman and Doherty, both on Triumphs. The latter took a toss at his first attempt owing to the greasy road, but afterwards made a good ascent.

A Fine Ascent.

A. C. Hardy, on a T.T. Norton, secured both fastest time and formula wins in Class III. He made a particularly fine ascent, which was unfortunately marred by his carburetter falling off about forty yards from the finish; in spite of this he was well ahead on time.

Class IV. for any twin produced some high speeds, being won by A. H. Dalton on a 5 h.p. T.T. Matchless. Fraser, who ran second, was wobbling badly. The fastest time went to Openshaw on an 8 h.p. Zenith.

Class V. was responsible for the two star performances of the day. Openshaw made fastest time of the day with a fine straight climb and roared past the finish at a great speed. In the previous class he broke his exhaust lift but managed to stop and get it repaired in time for Class V. In Class V. also A. C. Hardy made the best formula performance on his T.T. Norton. Incidentally he made second fastest time of the day, being beaten by Openshaw only, and tying with A. H. Dalton's 5 h.p. T.T. Matchless. In Class VI. for sidecars Openshaw was the winner both on time and formula, and made a very fine climb. The club is to be congratulated on its arrangements and organisation, and the members on their good fortune in getting through the afternoon without

L. P. Openshaw (Christ Church) making fastest time of the day on his 8 h.p. Zenith. He is credited with ascending the hill, which is half a mile in length, in 86 secs.

Oxford University M.C.C. Hill-climbing Competition.— rain. The number of spectators was disappointing, but it must be remembered that it was not an open hill-climb, and consequently was not largely advertised.

Class I.—Lightweights.

	Fig. of merit.

A.C.U. MEMBERS' A.G.M.

The above meeting was held at 89, Pall Mall, S.W., at 8 p.m., on Thursday last, Mr. J. R. Nisbet was in the chair. The sole business of the meeting was to elect delegates to the council and twelve individual members to serve on the A.C.U. Committee. In previous years members of the R.A.C., who, on account of their membership to that body pay a subscription of 5s. and yet enjoy all the privileges of the private member, voted as such. But this year the Chairman stated that he could not see it stated in the rules that they should vote as private members, and ruled accordingly. The following members were elected to serve as delegates on the council: Captain D. F. Nicholl, R.A., Messrs. W. H. Browne, B. T. Rhys Pyle, G. N. Higgs, J. Fletcher, A. H. Priestly, S. Carter, Hal Hill, Rev. E. P. Greenhill, Otto Thomas, W Pratt, F. A. McNab, C. H. Hawkins, D. K. Hall, W. H. Wells, A. G. Reynolds, W. G. McMinnies, F. A. Hardy, B. Marians, J. R. Nisbet, H. P. E. Harding, W. Cooper, V. Hart, A. Sharp, E. Nelson, H. G. Bell, D. M. Morgan, J. W. G. Brooker, T. H. Tessier, A. S. Ross, A. M. Low, O. C. Godfrey, A. G. Forster, and A. J. Sproston. The following twelve members were elected to serve on the General Committee: Messrs. T. H. Tessier, A. Sharp, B. T. Rhys Pyle, Otto Thomas, Rev. E. P. Greenhill, W. Pratt, W. H. Wells, G. L. Fletcher, W Cooper, A. H. Priestly, J W G. Brooker, and G. N. Higgs.

A home-made runabout built up with the frame of an old Singer governess car and a 3½ h.p. De Dion air-cooled engine. The change speed gear is made up of various old chain wheels and actuated by a gate change. The machine is driven daily between Barnet and Mill Hill by its owner, H. Ide, of New Barnet.

ESSEX OPEN HILL-CLIMB.

The entries for the above club's open hill-climb on Saturday next closed on the 9th inst., and are as follow:

Class A.—Engines not exceeding 275 c.c.

R. Holloway (Premier)	G. Griffith (Alcyon)
F. W. Applebee (Centaur)	N. D. Slatter (Alcyon)
Lieut. R. H. Hope (Levis)	E. A. Marshall (S.I.A.M.T.)
F. G. Scales (S.I.A.M.T.)	

Class B.—Not exceeding 350 c.c.

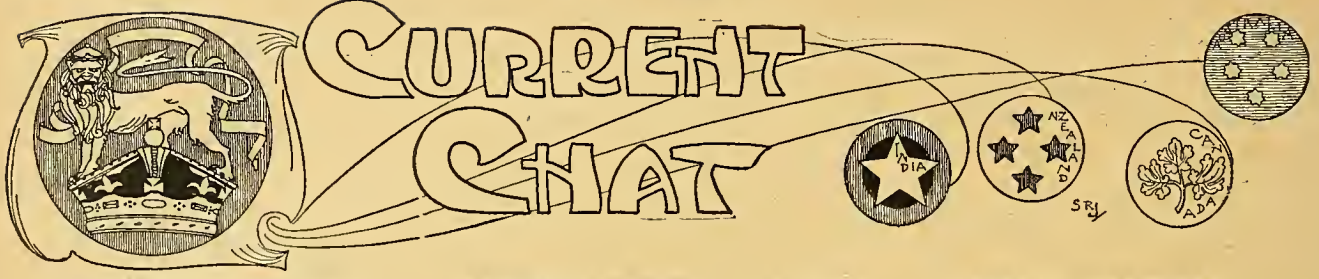
Rex Mundy (Singer)	*G. L. Fletcher (Douglas)
P. Weatherilt (Zenith-Gradua)	*Miss R. Hammett (Douglas)
C. S. Franklin (Singer)	*C Pearson (Douglas)
N. D. Slatter (Alcyon)	*F. W. Applebee (Centaur)
H. C. Newman (Ivy-Precision)	W. Aslen (Grandex)
T. E. Seear (Motosacoche)	W. Bashall (Humber)
*J. S. Holroyd (Motosacoche)	A. Bashall (Humber)
	F. C. Dear (Douglas)
	F. E. Pither (Humber)

Class C.—Not exceeding 500 c.c.

R. Holloway (Premier)	P. Brewster (Norton)
H. C. Newman (Ivy-Precision)	V. Taylor (Rudge)
S. R. Cooke (Rudge)	G. Griffith (Rudge)
*E. Gwynne (Rudge)	B. Pattison (Brown)
*G. T Gray (Rudge)	P. Weatherilt (Zenith Gradua)
W. D. South (Rudge)	F. A. McNab (Trump-Jap)
*W. H. Elce (Rudge)	J. Oliphant (Premier)
*G. D. Fletcher (Douglas)	*W. O. Oldman (Bat)

Class D.—Not exceeding 750 c.c.

R. Holloway (Premier)	Vernon Taylor (Rudge)
H. C. Newman (Ivy-Precision)	E. H. Lees (Indian)
*E. Gwynne (Rudge)	Hal Hill (Bat)
W. D. South (Rudge)	F. W Barnes (Zenith Gradua)
P. Brewster (Norton)	*W. O Oldman (Bat)



Class E.—Not exceeding 1,000 c.c.

*E. Gwynne (Rudge)	E. H. Lees (Indian)
P. Brewster (Norton)	Hal Hill (Bat)
A. Moorhouse (Indian)	F. W. Barnes (Zenith Gradua)
H. Bashall	*Alan Hill (Indian)
*D. Kapadia (Rex-Jap)	

Class F.—Passenger motor cycles, engines not exceeding 1,000 c.c.

*D. Kapadia (Rex-Jap)	*Alan Hill (Indian)
F. W. Barnes (Zenith-Gradua)	F. A. Applebee (Scott)

*These have also entered in their respective classes for the members' events.

TIME TO LIGHT LAMPS.

Mar. 14th	...	...	7.0 p.m.
,, 16th	...	...	7.3 ,,
,, 18th	...	...	7.7 ,,
,, 20th	...	...	7.10 ,,

Next Week's Special Issue.

The Special Spring Number of *The Motor Cycle* will contain many interesting articles and numerous extra illustrations. The number of pages will be considerably increased, but the issue will be 1d. as usual.

Brooklands Easter Meeting.

There will be a short race and a long race for all classes of motor cycles, also the First Hybrid Stakes. The last is a race for cyclecars, the engines of which must not exceed 1,100 c.c. and the chassis weight unladen 6 cwts.; the distance will be a short sprint of about two miles.

Military Motor Cyclists Wanted.

The Home Counties Divisional Telegraph Company Royal Engineers have a few vacancies for motor cyclists to make up its establishment, which is otherwise complete. The company officers are all enthusiastic motor cyclists, and intending recruits are assured of excellent opportunities of gaining knowledge and experience in this most interesting branch of the territorial force. Full particulars may be obtained at headquarters, 86, Riley Road, Brighton.

Australian Reliability Trial.

The West Australian M.C.C. is holding a reliability run from Perth to Kalgoorlie at Easter over a total distance of 362 miles. The captain of the club, Mr. Roy Wigmore, Subiaco, *viâ* Perth, W. Australia, would like to hear from secretaries of British clubs respecting the methods employed in this country for reliability trials. As the run takes place at Easter, any of our readers who feel disposed to communicate with Mr. Wigmore should write at once.

Why Petrol Prices have Increased.

In the last issue of *The Autocar*, there is an article under the above heading giving some of the reasons for the rapid increase in the price of petrol during the last few weeks. In the article the writer says that there is every appearance that further advances are in store. One cause is due to the dearth of available steamers for ocean transport; ships are now being built as rapidly as possible, but many months must elapse before there can be any appreciable increase in the number of oil tank steamers. At the time of writing the coal strike is affecting prices, and there does not appear to be any sign of settlement. Motor cyclists who have the opportunity of storing a few tins of petrol during the present week would be well advised to do so, as there is every indication of prices being still further advanced.

FUTURE EVENTS

Mar. 16.—Essex M.C. Open Hill-climb.
,, 23.—B.M.C.R.C. Race Meeting.
,, 23.—Herts. County A.C. Open Quarterly Trial.
,, 30.—Derby and District M.C.C. Open Hill-climb.
April 5-8.—N.W. London M.C.C. & Herts. County A.C. Joint Trial and Open Hill-climb (Yorks.) and Ladies' Competition.
,, 8.—Westmorland M.C.C. Open Hill-climb at Brigsteer Brow.
,, 13.—Oxford M.C.C. Hill-climb.
,, 13.—Liverpool A.C.C. Open Reliability Trial.

The Effect of Frost.

The accompanying photograph shows an unusual effect which was produced on a cold morning last week. The tank of a Triumph, which was undergoing its road test, was leaking slightly and the petrol dripped on to the high-tension wire. The evaporation of this, combined with the frosty morning, caused sufficient coldness to cover the high-tension wire with hoar frost as shown. A frozen carburetter is not

uncommon, and one often sees frost on the inlet pipe, especially if it be a long one, but frost on the high tension wire is, we think, unique.

SPECIAL FEATURES.

The Motor Cycle for Commercial Travellers
Climbing Honister Pass.
Consumption Comparisons.
Oxford University M.C.C. Hill-climb.

Motor Cycle Makers and the Coal Strike.

Motor cycle manufacturers in Coventry, Birmingham, and other places are mostly dependent on the various power stations and gas works for the running of their factories, and so long as the Corporation power stations hold out the works will be able to run. Deliveries of raw materials, particularly castings, have caused a certain amount of inconvenience, and in the case of the Rudge-Whitworth firm, who found deliveries of cylinders and crank case castings slow, owing to delays on the railway, a sidecar service was organised last week. One of this firm's testers was returning from Birmingham with a very heavy load of castings in a sidecar when the attachment parted company from the bicycle and the castings were strewn all over the road. The driver wisely halved his load and returned for the balance later.

British Imports and Exports of Motor Cycles.

In comparing the imports and exports of motor cycles and parts given in the following tables it will be noticed that the value of the exports for the month ended February, 1912, were over three times the value of the imports for the same period, while for the two months ended February the exports were over four times as much as the imports.

IMPORTS.—FOR MONTH OF FEBRUARY.

	1910.	1911.	1912
Motor cycles ..	£2,161	£2,898	£4,040
Parts thereof ...	4,187	6,209	8,214
Total ...	£6,348	£9,107	£12,254

FOR TWO MONTHS ENDED FEBRUARY.

	1910.	1911.	1912
Motor cycles ...	£5,837	£6,501	£7,520
Parts thereof ...	8,075	9,712	13,047
Total ...	£13,912	£16,213	£20,567

EXPORTS.—FOR MONTH OF FEBRUARY.

	1910.	1911.	1912
Motor cycles ...	£6,556	£17,140	£33,712
Parts thereof ...	2,904	3,809	10,059
Total ...	£9,460	£20,949	£43,771

FOR TWO MONTHS ENDED FEBRUARY.

	1910.	1911.	1912
Motor cycles ...	£15,258	£35,944	£72,432
Parts thereof ...	5,187	8,704	23,495
Total ...	£20,445	£44,648	£95,934

A.C.U. One Day Trial.

A sub-committee has been appointed to enquire into the causes of the mismanagement of this trial, and to select a suitable date for the event to be re-run.

A.C.U. Office Staff.

Owing to the great increase in the membership the A.C.U. has decided to increase its office staff by the addition of a junior clerk and a junior shorthand typist.

Red Rear Lights.

Another driver of a horse and cart was summoned and fined in Warwickshire last week for failing to carry a rear light or reflector. This makes the third conviction in the county since the new byelaws came into force.

Australian Road Records Beaten.

We have just received news that G. Patterson, jun. (who was a well-known performer at open hill-climbs last year, and has lately repeated his successes at Otago and Canterbury, New Zealand), has beaten all Australasian road records, covering the distance of three hundred and twelve miles in twelve hours, and in twenty-four hours no less than five hundred and forty-seven miles. Considering the state of the roads in Australia, this speaks well for the machine, a 3½ h.p. New Hudson.

The A.C.C.F. Easter Trial.

On February 15th we published an outline map of the course for the above event. The A.C.U. has decided to send over a team to compete in the competition, and this week a representative went to Paris to make arrangements. Our idea is that the A.C.U. should make the trip as attractive as possible, and suggest to the French club that the start should be outside Paris—Mantes, for example, is but 86½ miles from Dieppe—and so organise things that the whole trip is done by motor cycle and steamer and not by train. Further enquiries should be sent to the Secretary, A.C.U., 89, Pall Mall, S.W.

Moto Cycle Club de France Hill-climb.

The Moto Cycle Club de France is organising a hill-climb for the 24th inst. on the Argenteuil-Montigny les Cormeilles road. The course is three kilometres in length, of which one kilometre is on level ground and two kilometres are up hill. The chief attraction to English riders will be the International Challenge Cup. The following classes will be run:

Motor Cycles, Class I.—Section A, up to 225 c.c.; Section B, up to 350 c.c.; Section C, up to 500 c.c.; Section D, over 500 c.c. An allowance of 10% will be made for multi-cylinder machines.

Class II., for Tricars and Sidecars.—Section A, up to 500 c.c.; Section B, above 500 c.c.

Class III., Cyclecars.—Light cars in touring trim, not exceeding 350 kilogrammes, air-cooled engines, any type of transmission, metal spoked wheels. All vehicles must conform to the descriptions in the catalogue.

The entry fee is 20 francs, and entries close on the 18th inst. to the Secretary, 48, Rue St. Ferdinand, Paris

R.A.C. Warning Signs.

Owing to the dangerous nature of the level crossing over the Midland Railway on Watling Street between Daventry and High Cross, the Club will erect a special danger sign at this point.

The Six Days' Sidecar Record.

Mention has been made of an attempt to beat the existing six days' sidecar record by A. Butler. Mr. Butler left London on the 6th inst., and was last heard of on Monday at Newmarket, when he reported all well.

A New Challenge Cup.

A silver challenge cup has been presented to the Sutton Coldfield A.C. by Mr. W. R. Jones, of the Whittall Engineering Co. It is to be called the Ixion Cup, and has to be won three times in succession by an amateur.

Motor Cycles Registered in London.

During January 360 motor cycles were registered by the London County Council, whilst 3,685 licences to drive were issued.

Motor Cycle Tours in Sweden.

The triptych system has been extended by the Swedish authorities to include motor cycles. Hitherto the duty had to be paid on landing. The triptych is obtainable from the A.C.U. and A.A. and M.U.

Toronto Show.

The annual motor show was held in the Armouries, Toronto, from February 21st to March 1st, when a good range of motor cycles was shown. American machines took the lead. Two British makes were shown, viz., Rudge and Triumph.

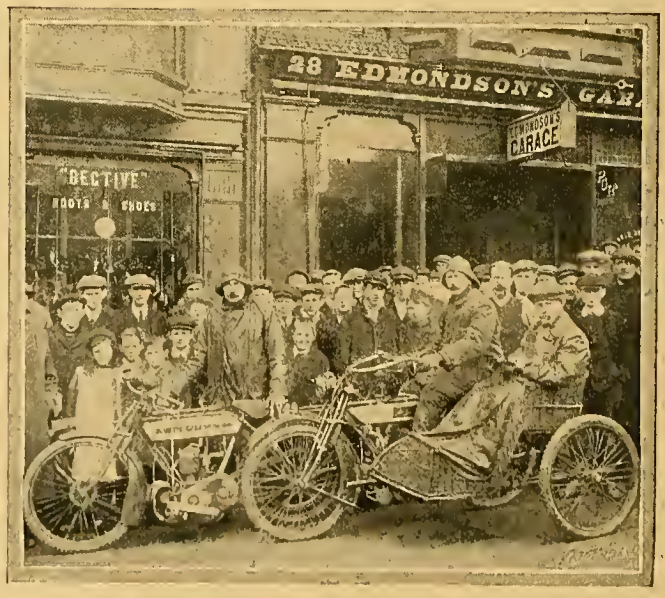
THE STEEPEST GRADIENT OF HONISTER PASS.

Frank Smith (5 h.p. Clyno) making the first authenticated ascent of Honister on a motor cycle and sidecar last Saturday.

WHEN Mr. H. Newman's challenge appeared in *The Motor Cycle* a few weeks ago with regard to an ascent of Honister Pass from the Buttermere side, one little thought that the event would develop such interest as it did. Mr. Frank Smith duly made his appearance at Keswick last week in anticipation of the arranged attempt on Saturday, the 9th inst., for he had accepted the challenge with his 5-6 h.p. Clyno and sidecar. When we arrived at Keswick the day previous to the climb excitement ran high, and a small crowd outside Edmundson's garage denoted unmistakably that the champion motor cycle mountain climbers were inside. But F. Smith was not alone in his object. Seeing the published arrangements which the Cumberland County M.C.C. had made, others were seized with a desire to try their prowess, and when the time for the line up at Keswick arrived, the under-mentioned were ready for the fray.

Frank Smith (5-6 Clyno sidecar), four speeds, chain drive.

Hugh Gibson (3½ Bradbury and empty sidecar), two speeds, chain drive.



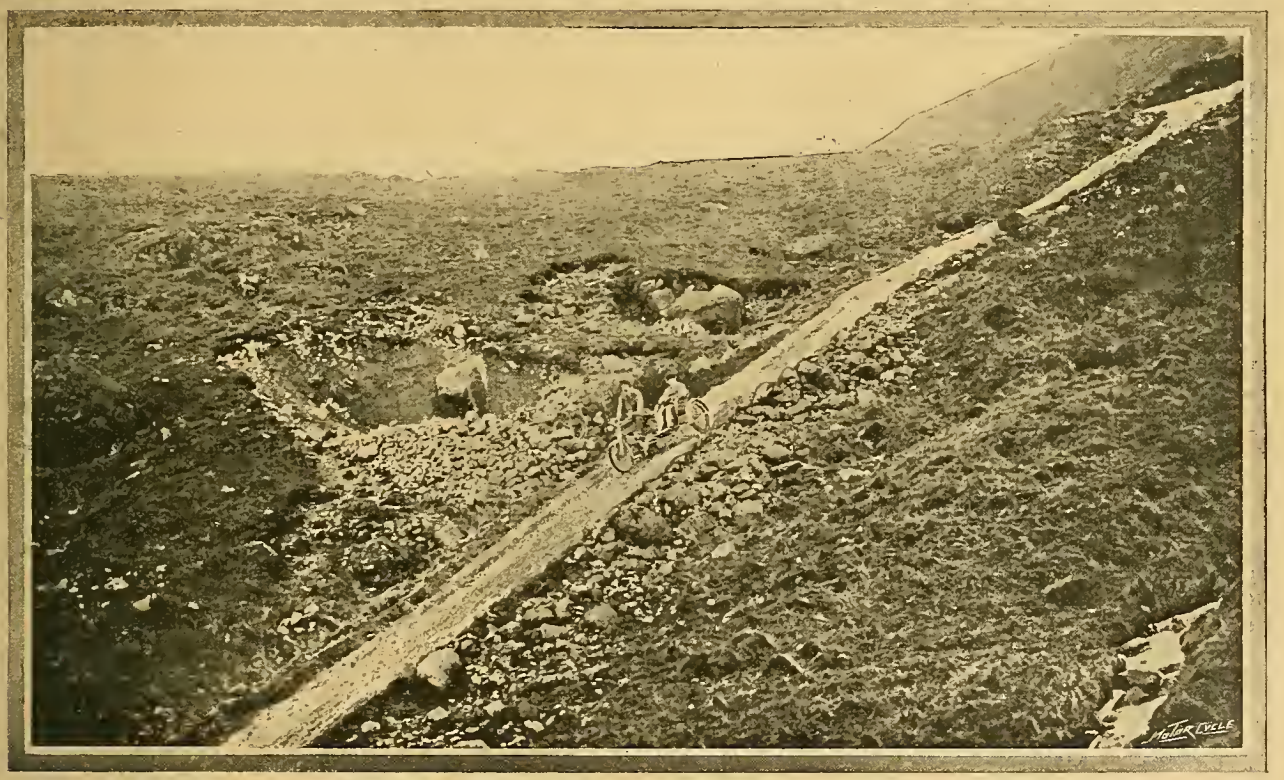
Vernon Taylor (3½ T.T. Rudge), single gear, belt drive.

Bert Haddock (2½ A.J.S.), two speeds, chain drive.

Not having seen Honister, we were told with bated breath of the stony surface, little better than a sea beach, the appalling gradient in the middle, the narrow road, and, above all, the yawning chasm awaiting the unfortunate motor cyclist who failed to steer a comparatively straight course. Practising, it appears, had been going on for days, and in each instance there seems to have been a hurried retreat to fit lower gear ratios, and gears of 17 and 17¼ to 1 were consequently the order of the day.

The day was fine, but clouds overhead looked threatening enough. However, the conditions did not deter the members of the Westmorland and Cumberland county clubs journeying from various parts to witness the first official attempt to climb Honister on a sidecar. It had been arranged to journey *viâ* Newlands, but time having been lost, the programme was slightly altered and the more direct way followed *viâ* Derwentwater and Seatoller.

The road surface was in a very greasy state, besides



Starting for Honister from Edmondson's Garage. Hugh Gibson (3½ h.p. two-speed Bradbury) and B. Haddock (2½ h.p. two-speed A.J.S.)

Honister Pass Climbed.—

being twisty and rough, consequently slow progress was made. At the foot of the old road to the top of Honister we came upon a small crowd of motor cyclists who were busy lowering gears, and many were the hurried attempts to get up the hill. Practically all, however, had to resort to the toll road, which is easier, though severe.

The Stony Surface.

About three o'clock the Midlanders commenced to descend the hill, and this in itself was no light task, as it was impossible to travel at more than a snail's pace for fear of losing control of the machine. The order of starting had been settled by a spin of the coin, it being agreed that Frank Smith was deserving of the first attempt, seeing that the climb was the outcome of his offer. The spectators selected a point about half a mile from the summit of the pass, where the steepest gradient is encountered, and which was estimated to be about 1 in 3. The start was from the last farmhouse from Gatesgarth after Buttermere, and the distance from here to the top of the pass is a little over two miles. But the surface! Never have we seen motor cyclists attempt to ride over its equal. It is exactly like a river bed, big flat stones lying about in thousands. Our first impression was that it was hardly a fair climb. The long wait before the Clyno sidecar appeared in sight was sufficient to rouse the excitement of the crowd to fever heat. The minutes sped by, but no one came in sight until a spectator espied the Clyno low down in the valley over a mile away, and then all eyes were strained to watch it make its slow progress up the pass. As Smith approached, it was seen that the stones were bouncing the machine all over the road, and the difficulty was to steer anything like a straight course. His speed would be about six to eight miles an hour, but even at this pace, no matter how the handle-bars were gripped, the front wheel would follow its own course. As for the rear wheel, it was churning up stones and deep ruts, especially so when the steepest pitch was reached. Here was the crux of the climb. The crowd cheered vociferously as Smith struck the steepest gradient. Gradually the speed got slower and slower. Would he do it? At the top of this steep pitch there is a huge boulder which in practice had stopped nearly every competitor, as even though the front wheel was sometimes persuaded to mount the stone, the back wheel refused to climb over it. It was now a case of touch and go whether the Clyno would be successful. For one moment the front wheel rose in the air, and seemed to hesitate whether it would go over or not. The driver stood on the low gear pedal, the machine lifted, and then appeared to spring over, every tube being strained to its uttermost. It was indeed a sight to see. The crowd was delighted, and never have we seen such enthusiasm evinced in a feat of this kind. Both passenger and driver looked thoroughly frightened, the passenger especially so as he excitedly threw his legs in the air as the front wheel lifted on the boulder, and one can quite understand it, seeing that rocks and boulders fifty feet below awaited the sidecarists if they failed to keep in the ten-foot roadway. The crowd, realising that the climb was almost bound to be successfully completed, jumped down from the rocks and ran after the

A SCENE NEAR THE TOP. F. Smith (Clyno) may be observed descending the hill for his attempt.

Honister Pass Climbed.—

Vernon Taylor (T.T. Rudge) at the last bend on the Pass. Note the stony condition of the surface. Honister Crag is seen in the background.

machine as it completed the last half mile. Some, anxious to congratulate Smith, arrived at the top completely fagged out. Saturday, March 9th, will go down in history as the first occasion on which Honister was climbed on a sidecar with two passengers, and the credit must go to the Clyno.

The Solo Climbs.

Next to try his luck was Hugh Gibson, whose Bradbury seemed in exceptionally fine fettle. He had attached a very light sidecar, his idea being that he would be better able to steer a straight course with a sidecar. His Bradbury climbed the pass on the low gear at a really splendid pace, and appeared to have plenty in hand, except on the steep section. His task to keep the light sidecar down appeared to us most difficult, for at times he had to lean over until his body was almost horizontal. Encouraged by his success, later in the afternoon he attempted the Pass with a light passenger, but could not top the 1 in 3 section.

Vernon Taylor next tried his luck on a T.T. Rudge, but, although he assured us that he had made a clean ascent in practice, three times he stopped, due to the engine roaring round and the belt slipping. After descending the pass and raising the gear to 7½ to 1 to give the belt a better chance to grip, he made the fastest ascent of the day. His exhibition was, in fact, a hair-raising one, for no one imagined that such a speed could be maintained without fear of a bad fall.

Bert Haddock, on a little A.J.S., picked his way slowly up the pass, his engine never exhibiting signs of distress, despite the 17¼ to 1 gear. Occasionally he would put his foot down to steady himself, but this was well-nigh impossible to avoid. Somewhere about the middle of the pass he picked up a pin in the back tyre, and gradually it deflated until, within sight of the summit, his machine came to a standstill. Locating the puncture took some time, so, descending to the first bridge (which section includes all the severe gradient), he made a sure climb, only touching the ground with his feet on one occasion.

Some of the Westmorland and Cumberland County Club members also tried their luck. W. Westwood on a T.T. Triumph, which appeared to have a Motosacoche engine pulley, did well, but he was obliged to jump off and run alongside on the steepest part. When he regained the saddle everyone imagined that he would successfully reach the top, but this was not to be, for, within a hundred yards of the summit, he fouled a big stone and shot clean off the side of the road, his machine after him. At this point, it so happens that the mountain stream is further away from the roadway and the bank is inclined. If he had fallen two hundred yards lower down the hill there is no knowing what might have happened to him and his machine.

Riders of a 7 h.p. Indian, 3½ h.p. three-speed Premier, T.T. Rudge, and Zenith Gradua tried conclusions, but all failed from one cause or another, Fletcher on the three-speed Premier on the third or fourth attempt successfully reaching the summit, though he had perforce to use his feet vigorously.

Climbing the Old Road.

While these last mentioned ascents were in progress F. Smith had descended the other side of the pass known as the old road from Seatoller. It will be remembered that Hugh Gibson made this climb about twelve months ago on a Bradbury, and a long controversy followed in these pages. Suffice it to relate that Frank Smith and his victorious Clyno were again successful in their self-imposed task.

Our Spring Number next week will contain references and further photographs of this hill-climbing expedition in Lakeland, including Red Bank, Grasmere, and Kirkstone Pass. The pictures were taken specially for *The Motor Cycle* by Mr. G. P. Abraham, F.R.P.S.

M.C.C. LAND'S END AND BACK RUN.

The following additional entries have been received for the Land's End and back run at Easter:

F. C. Wasley (2¾ Douglas)
P. Grout (4½ Quadrant)
A. G. Barr (3½ Quadrant)
G. B. Fry (3½ Quadrant)
J. A. Neumann (3½ Rudge sc.)
B. Marians (3½ P. and M.)
P. H. Bentley (3½ Triumph)
R. C. Owen-Wells (3½ Bradbury)
C. W. Meredith (3½ Bradbury)
G. T. Gray (3½ Rudge)
W. H. Elce (3½ Rudge)
G. Brough (6 Brough)
W. C. Hemy (3½ Precision)
J. S. Holroyd (2½ Motosacoche)
A. J. Sproston (3½ Rudge)
W. Cooper (3½ Bradbury)
R. Lord (6 Rex sidette)
J. Milner (7 Indian)
P. Phillips (2¾ Douglas)

Competitors are advised not to leave it too late in applying for rooms at the Union Hotel, Penzance, and the Bridge House Hotel, Staines, if they intend staying there on the Friday. A dinner will be prepared at the Bridge House Hotel at 8.30 p.m. The trials hon. secretary is Mr. Edwin Gwynne, White Lodge, Crediton Road, West Hampstead.

THE HILLS AT CUDHAM.

IN view of the fact that Cudham Hill was included in the A.C.U. One Day Trial on the 2nd inst., a few particulars regarding the gradient, etc., taken from the current issue of *The Autocar*, will be of interest to our readers. Cudham Hill is the hill on the road from Downe, and must not be confused with Church Hill, which leads across the valley from the church to the main Westerham road at Biggin Hill. Of these two hills Cudham is considerably the snorter and steeper. The total length is 700ft. (rather more than one furlong), and the rise is 101.36ft., which gives an average gradient of just over 1 in 7 (by this we mean a little steeper than 1 in 7). The gradient begins with 1 in 10½, and gradually increases for the first 100 yards, by which time it is 1 in 8; then it becomes rapidly steeper till its extreme gradient of 1 in 4.1 (very nearly as steep as the steepest part of the test hill at Brooklands) is reached 150 yards from the start, after which the gradient relaxes slightly till at a point 220 yards from the start it is 1 in 6.3. This is practically the top of the hill, for the last few yards are only 1 in 35.7. One hundred and seventy yards from the start this hill joins Church Hill, the gradient at that point being 1 in 5.4. As is usual on all hills, the steepest gradient is at the bend.

Church Hill, Cudham.

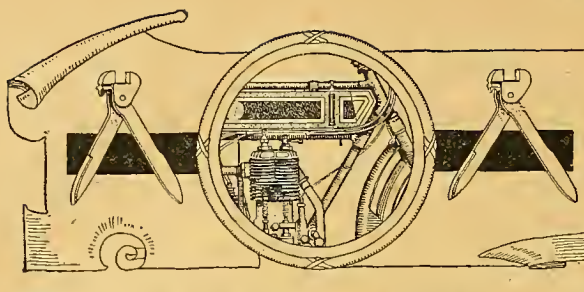
Cudham Church Hill is 1,250 feet in length, with a total rise of 155 feet, giving an average gradient of nearly 1 in 8. The steepest gradient is 1 in 5.34 nearly 100 yards from the start, then the hill becomes less steep for some distance, but it gets more severe as it nears the top. There are two bends, the first being 100 yards from the start, and the second (a veritable hairpin) just before the roads join 80 yards from the top.

Some members of the M.C.U.I. (Ulster Centre) who took part in the paper-chase held recently through Co. Down.

A.C.U. NOTES.

MEMBERSHIP.—At the last committee meeting 173 members were elected.

AFFILIATIONS.—The following clubs have become affiliated to the governing body: Wimbledon M.C.C., Cardiff M.C., North Birmingham A.C., Brookdale Club (Catford), and Gloucester M.C.C.



ANNUAL GENERAL MEETING OF THE COUNCIL.—It was decided that the election of club representation to the committee should be deferred five weeks in order that the procedure under the new rule regulating the method of electing club representatives may be brought into order. The existing committee and sub-committee meanwhile remain in office.

PERMIT.—A permit was granted to the Motor Cycling Club to run off an open silencer trial on April 27th.

FRENCH RELIABILITY TRIAL.—Mr. E. M. P. Boileau was appointed delegate to meet the A.C.C.F. secretary in Paris to discuss the arrangements for an English team to compete in this event at Easter.

A.C.U. AND M.C.P.A. COMMITTEES.

It will be seen that at the annual general meeting of the private members of the A.C.U. the Progressive party carried the day. Every one of the members they suggested as forming the new committee was elected with one exception, and in his place a keen amateur rider was chosen. It is true that, as we pointed out in a previous issue, the trade is rather strongly represented, as there are five members of the new committee who are actively engaged in the motor cycle industry. On the other hand these members have had great experience, are keen riders, and know their machines from stem to stern; in fact, it is a committee of motor cyclists, and as such should do excellent work for the Auto Cycle Union. We hope that the new members will succeed in bringing about a better organised and more active programme. It has been suggested to us that the M.C.P.A. might also devote its attention to the trade assisted "amateur." It has been alleged that one so-called amateur has ridden five different machines in five important events since Christmas.

FRAME DESIGN.

WE have long deluded ourselves with the belief that our frame design was above suspicion, but it was pointed out by an expert some days back that there is much which may be improved. Some of the worst faults are the cranking of the chain stays to allow room for the belt rim and the short steering head used on many makes. To remedy these faults the makers put in very heavy castings, with the result that the machine is somewhat heavier than it need be if properly designed. I would point out, however, on behalf of the manufacturers, that some of them are alive to these defects and are trying to remedy them by a better design; for instance, the Rudge has straight chain stays with a single sweep in at the top, and this lead has been followed by quite a number. I could name off-hand half a dozen so built. In this connection it is as well to notice that chain drive permits a much better design of frame, making it much easier to employ a perfectly straight chain stay.

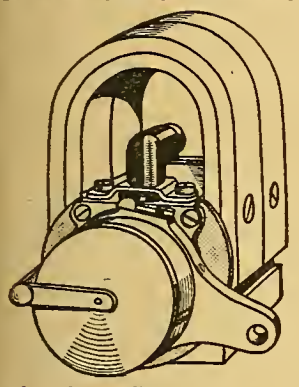
Short Steering Heads.

The short steering head is remedied in most cases, for example as in the B.S.A. machine, also in the Chater-Lea and Royal Enfield; this is varied in some makes by the use of a web in place of the short reinforcing tube. Another point of criticism is the method of attaching the engine by cradle plates, and the expert mentioned above gave as his opinion that the loop frame was stronger and more desirable than this method. Personally, I believe a lot depends on the design of the cradle plates—some grip the engine at two points very near together, and often much out of the line from the centre of the engine to the rear wheel. The tendency to adopt the Trump method of employing a stay from the bottom of the crank case to the rear of the chain stay is a confession on the part of the makers that all is not as it should be. The Bradbury method of incorporating the crank case in the frame gives a very strong and rigid frame, and allows the secondary top tube under the tank to be dispensed with, but the great drawback to this method is the inability to remove the engine as a whole.

The Dropped Top Tube.

As regards the rear part of the frame, it has been admitted that the chain stay if continued should pass through the centre line of the engine axle.

A few words concerning the merits of the dropped top tube. It is generally said that this gives a much lower riding position, but this is not the best of its advantages; in fact, the diamond frame enthusiasts say that they can obtain just as low a riding position, and they are correct, at least to half an inch or so. To obtain the very low position with the diamond frame means that the steering head has to be very much shortened, while with the dropped top tube a long steering head and large tank may be retained, and the riding position still be brought low. Also the dropped frame allows the weight of the rider to be distributed more equally on the two wheels, at the same time keeping a short wheelbase; this makes for steadiness on greasy roads and better steering at high speeds, since if the front wheel be insufficiently loaded steering at high speeds becomes very difficult. The dropped frame is somewhat weaker at the dropped end of the tube than if the tube were kept straight, but no trouble is likely to arise from this if the secondary tube be kept straight; I do not, however, like those frames which have both tubes dropped, there is no advantage in dropping the lower tube, and it weakens the frame too much. *Apropos* of frame strength, I was told by a leading firm last week that the ordinary frame as fitted to 3½ h.p. machines was not strong enough to take a sidecar with perfect satisfaction, and they are making it a practice to use heavier gauge tubes in all their 3½ h.p. two-speed machines. I do not wish to raise a scare amongst the single-cylinder sidecar brigade, but let them not be surprised if after running with thirty stones or so aboard they find their frames slightly twisted. A.G.D.C.

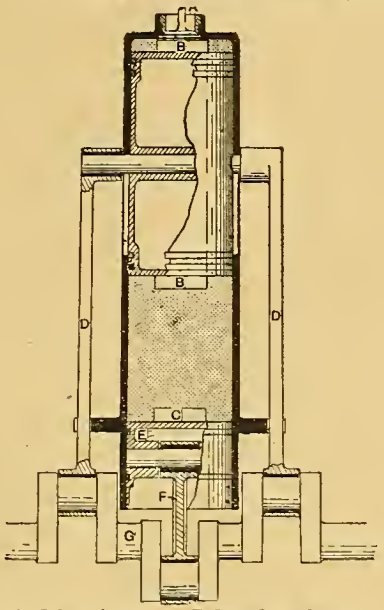


"Two Beauties," the title suggested by B. Dungworth, of Sheffield, who sends the above picture of his Korry-Abingdon and bulldog pup in the sidecar.

THE EISEMANN WATER-PROOF MAGNETO.

The new Eisemann magneto is a splendidly compact job, which is claimed to be absolutely waterproof. One of the chief points of interest is the fixing of the high-tension brush holder. Instead of the brush holder being screwed in by a vulcanite thread, which is liable to crack and cause mysterious shorting, it

is held in place by a strong steel clamp, fixed by two screws, thus preventing the possibility of the brush holder working loose. The substantial cap on the high-tension terminal is carry neatly and sensibly carried out; quite a tug is necessary to remove it, and there is no fear of its coming adrift and perhaps spoiling a non-stop run.



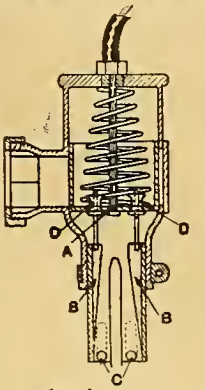
Though of small size, the magneto gives a fine hot spark. As will be seen, there are four horseshoe magnets. The Eisemann magneto is being used by several leading firms, including Rudge-Whitworth, Ltd., and Humber, Ltd.

THE SIMPLEX TWO-SPEED HUB GEAR.

A two-speed hub gear was described and illustrated in our issue of April 6th last year, page 326. This gear will be shortly manufactured by the Eagle Motor Co., Shepherd's Bush Road, W., and will be put on the market under the name of the Simplex. It is of the epicyclic type giving a reduction between the high and low gears of 45%. The chief alteration since the gear was first described is in the operation of the high gear brake arrangements. Weight will be reduced by the introduction of an aluminium and steel alloy whenever possible. In this way it is hoped to reduce the weight of the ordinary gear to twenty pounds. Two hubs are made The standard is suitable for engines up to 9 h.p., and a smaller type is also made for 3½ h.p. and under. All the running parts are mounted on ball bearings, which may be adjusted equally by means of one cone. In future models all the ball bearings will be of the cage type, so that the gear may be dismounted without any risk of losing the balls. With this gear the engine may be started by pedalling with the rear wheel on the ground. The gear impressed us most favourably.

NEW TWO-STROKE ENGINE

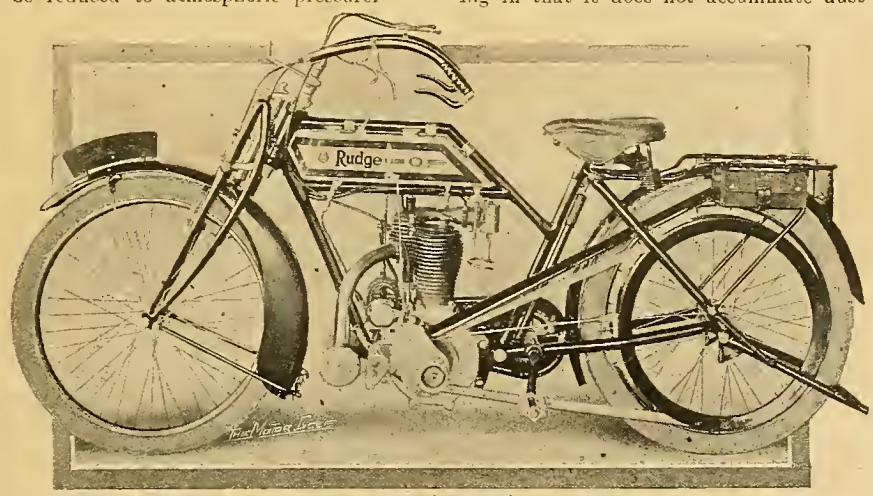
Herewith we publish a diagram to explain the principle of a two-stroke engine designed by Mr. J. Taylor, of Wakefield Lodge, Stony Stratford. The gas is taken in through the inlet valve A and is compressed above the main piston. The lower of the two transfer ports B being, of course, covered by the



A Inlet valve
B B Transfer ports
C Exhaust port
D D Connecting rods from double piston.
E Secondary piston
F Connecting rod for E
G Three-throw crank

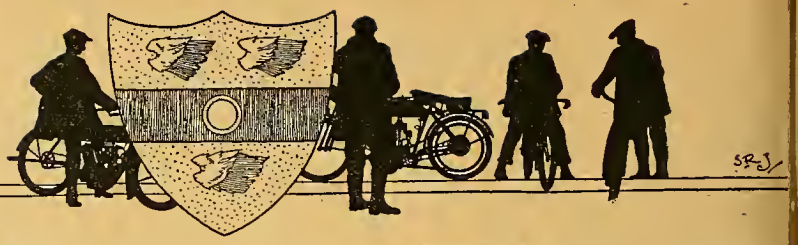
piston until the compression stroke is almost complete. Both ports B are then uncovered, and the charge is forced into the space between the main and secondary pistons. Here it is compressed and fired in the usual way, the explosion acting on the heads of both pistons and the exhaust port being uncovered by the secondary piston. The crank to which this piston is attached has a shorter throw than those for the main piston and is also given a slight lead, thus the port C is opened considerably before the lower port B, giving the exhaust gases ample time to be reduced to atmospheric pressure.

A B. & B. CARBURETTER MADE AUTOMATIC.



The accompanying diagrammatic sketch, which has been sent to us from Capetown by "Interested," shows how a lightweight B. and B. carburetter of ordinary type can be altered to an automatic carburetter having one-lever control. The original extra air hole is covered, and all the air is taken from the bottom air holes, which are enlarged as shown by the dotted lines. The admission of air is now controlled in two ways—(1) by the uncovering of the elongated holes, and (2) by means of the taper choke tube, which rises and falls as the throttle is opened. The throttle and air slides can be joined together to form the new throttle or a new slide can be fitted. The top of the jet is slightly tapered. The adjustment of the air opening in relation to the throttle can be made by the screws D. "Interested" has this carburetter fitted to a lightweight N.S.U. and finds it most satisfactory and efficient.

A, throttle
B, sliding choke tube attached to A which uncovers the air holes as it rises
C, air holes, enlarged as shown by dotted lines
D, screws holding B to A



A TIP FOR ALL-WEATHER RIDERS.

If an all-weather rider does not mind spoiling the appearance of his machine, he can coat the whole of the parts with lead coloured paint which will protect the enamel and will not look at all unsightly if properly done. Such paint can be removed when desired with the aid of a solvent like turpentine or benzine. The bright parts of machine tools are often treated in this manner for the purpose of transit or for storing, and the result is not at all displeasing. This method has one great advantage over the vaseline coating in that it does not accumulate dust

The 1912 model lady's 3½ h.p. Rudge, which, as will be seen, is identical with the design of the standard men's machine, except for the cut away top tube and belt guard.

CLUB NEWS

Woolwich, Plumstead, and District M.C.

The inter-team trial in connection with the S.E. London M.C. will take place on the 16th inst.

The Easter tour to Cheddar will start on April 4th.

Bristol M.C.C.

Despite the horrible state of the roads, which, in fact, were so bad that several turned back owing to skids, the speed-judging competition was a great success, and resulted as follows: 1, F. P. Davies (3½ Rudge and sidecar), 10s. error; 2, E. Kickham (2¾ Douglas), 12s. error; 3, S. J. Webber (3½ Triumph), 14s. error.

Redditch and District M.C.C.

At the annual general meeting held on Wednesday, the 6th inst., the following officers were elected: President, Dr. Prothero Smith; captain, Mr. H. T. Guise; treasurer, Mr. Frank Hyde; secretary, Mr. W. F. Skinner, 4, Prospect Hill, Redditch. Members who wish to have the A.C.U. facilities must pay their subscriptions (6s. each) at once, as members' names and fees are sent up to the A.C.U. as received by the club.

Bournemouth and District M.C.C.

The opening run was held on the 3rd inst. to Lyndhurst and Rufus Stone in the New Forest. Several other runs have been arranged for the remainder of the present month. On the 13th inst. the meet is at King's Park, at 2.45 p.m., for Salisbury. Any local motor cyclists who wish to join the club are cordially invited to send their names to Mr. Noble Iddon, hon. sec., Berkdale, Shaftesbury Road, Bournemouth.

Oxford M.C.C.

The classes for the open hill-climb on April 13th are as follows: Junior T.T. machines; T.T. machines up to 500 c.c.; standard single-geared touring single-cylinder machines; standard single-geared touring twin-cylinder machines; standard variable-geared touring single-cylinder machines; standard variable-geared touring twin-cylinder machines; standard touring machines up to 150 lbs., single or variable geared; any type of single or twin up to 1,000 c.c.; standard touring sidecar combinations up to 1,000 c.c.; standard touring cyclecars up to 1,100 c.c., weight in touring trim not exceeding 7 cwts., or chassis weight, including tyres, not exceeding 6 cwts.

Bradford M.C.C.

The open hill-climb will take place on May 18th. Fu details will be published later. There will also be minc hill-climbs on March 30th and May 4th, and reliability trial on April 28th and May 12th.

Herts County A. and A.C

The open trial on Saturday, the 23rd inst., will start fro the Old Salsbury Arms, Barnet. With slight deviations, th route will be much the same as in the last trial. The speci tests will be a 10 m.p.h. hill-climb, a stop and restart on hill, and a fast hill-climb. Entries close Saturday next, th 16th inst. Particulars may be had from Mr. C. C. Cook North Mimms, Hatfield.

Mersey M.C.

On the 8th inst. an interesting lecture, illustrated b limelight views, was given to an appreciative audience b Mr Chas. F. Larkin, F.R.C.S. The lecturer described tour via York, Newcastle-on-Tyne, and Carlisle to the Lak District. On the 18th inst. Mr. Bennett will lecture o "Magnetos"; this lecture will be held at the club head quarters, and all motorists are heartily welcome.

Birmingham M.C.C.

The Easter reliability run to Perth will be on April 6t and the return will be made on April 8th. This is the longe reliability trial that has ever been organised in the province and a large entry is expected. The competition is open Birmingham Club members only, owing to the difficulty o obtaining a permit for a two days' open trial. Intendin members may obtain particulars of the competition an terms of membership on application to the trials hon. sec Mr. Harold J. Cox, 21, Stirling Road, Edgbaston.

Western District M.C. (London.)

On Saturday, the hill out of Rickmansworth was th scene of an impromptu hill-climbing contest. The way th vice-captain's (F. W. Ritchie's) three-speed 2¾ h.p. Humbe climbed it called forth much favourable comment.

The next club run is on the 17th inst., to Stokenchurc (King's Arms), starting from the Horse Troughs on Ealin Common at 10 a.m.

The hon. secretary, Mr. G. Tweedie, A.M.I.E.E., 1 Baldwyn Gardens, Acton, W., will be glad to send particu lars of the club to motorists in Ealing and neighbourhood

Start of the Bournemouth Motor Cycle Clu Opening Run o the 3rd inst. to King's Park.

L. V. Head, the talented young artist whose sketches have recently been reproduced in *The Motor Cycle*. He is shortly going to Canada and will take his Minerva machine with him.

Sidecar for Milk Round.

I am thinking of starting a milk round, and wish to deliver from the farm, which is about seven miles distant, so I should like to know if you think a motor cycle with box similar to a sidecar would be reliable enough, provided I got a good machine, as it would mean thirty miles a day in all weathers? The weight would be equal to myself—12 to 13 stones. I should also like to know your opinion of what it would cost to run, including wear and tear. I prefer a single-cylinder, as I am only a novice.—G.R.

e think the idea is an excellent one, and ould recommend you to get into commun- cation with one of the sidecar makers garding the manufacture of a special tachment for your purpose. You may ckon the cost to be from 1d. to 1½d. a ile. We should recommend you to get a st-class make of motor bicycle fitted with riable gear.

Sidecar Weight.

I am hesitating in the purchase of a sidecar, and would be much obliged for replies to the following enquiries: (1.) In the case of a sidecar driven by a 3½ h.p. three-speed James (single cylinder of large capacity, 557 c.c.), what is roughly the most suitable weight of car, in order to prevent unduly taxing the power of the engine, on average roads with gradients reasonable for the combination? (2.) Would a torpedo body on a chassis as light as is consistent with safety, be too heavy a type for such a machine to pull? (3.) Does the torpedo body possess any advantage or disadvantage as regards distribution of weight, in that some luggage may be carried in the front portion of the car?—HARICOT.

1.) Your machine should certainly be able o draw a sidecar weighing from 90 to 00 lbs. (2.) A torpedo body would not be oo heavy. (3.) It affords better protection o the passenger than the ordinary pat- ern, and is cosier. It is not advisable o place much weight in the front of the idecar; luggage is best placed at the rear.

Testing Dry Cells.

Please tell me why a dry cell will not work a trembler coil on my motor cycle, whereas an accumulator will, though I have tried adjusting the points on the coil, but without success. It is a wipe commutator. The accumulator shows four volts exactly, and the dry cell 4.125, on a voltmeter.—H.F.

Many trembler coils are most extravagant in current, and if the coil takes a great deal of current, the dry cell tires very quickly. What we should advise you to do is to write to the makers of the dry cell, and ask them to supply you with a coil suitable to work in conjunction with it. It is no use testing a dry cell with a voltmeter, as, although the voltage may be high the ampèrage may be quite insufficient. Dry cells should be tested by being momentarily connected to the terminals of an ampèremeter.

NEXT THURSDAY!

THE MOTOR CYCLE

NINTH SPECIAL SPRING NUMBER.

An Easter Tour.

Please give me the most interesting route for an Easter tour from Lincoln *viâ* Oxford to Winchester, coastwise to Exeter, then north *viâ* Gloucester, Stratford, and Warwick to the Dukeries.—E.A.D.

We have pleasure in giving the following route: Lincoln, Grantham, Oakham, Uppingham, Kettering, Northampton, Towcester, Brackley, Oxford, Abingdon, East Ilsley, Newbury, Whitchurch, Winchester, Romsey, Ringwood, Poole, Lychett Minster, Wareham, Dorchester, Bridport, Lyme Regis, Colyford, Exeter, Honiton, Chard, Ilchester, Shepton Mallet, Radstock, Bath, Nailsworth, Stroud, Gloucester, Cheltenham, Evesham, Stratford-on-Avon, Warwick, Coventry, Hinckley, straight on to Nottingham, then through Mansfield, Worksop, West Drayton, Newton, to Lincoln. For details as to the roads round the Dukeries see a map of Nottingham and Derbyshire.

EXPERIENCES WANTED.

Readers desirous of obtaining the experiences of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries below should be addressed c/o The Editor.

"H.T." (Hull).—3½ h.p. Lincoln-Elk.

"B.R.H." (Leeds).—Atlas inner case.

"R.H.C." (Bridgwater).—3 h.p. Lincoln-Elk.

"T.M." (Taunton). — Haslam non-stretching belts.

"O.J.J." (Barnes).—2¼ h.p. F.N.

"J.P." (Cambridge).—Albion, D.H.K., and Mahon clutches on 3½ h.p. machines.

"L.P." (Rossnakill.)—3½ h.p. Lincoln-Elk with sidecar.

"D.M.D." (Llandrindod).—6 h.p. Zenith sidecar, consumption and reliability.

"E.D.F." (Great Wakering).—Thornton two-speed free engine hub with 3½ h.p. sidecar.

"J.I." (Auchinblae).—2¾ h.p. Douglas and 3½ h.p. Humber two-speed models with and without sidecar.

"P.E.H." (Oakham).—3½ h.p. New Hudson three-speeds and sidecar.

"P.Q.R." (Dartmouth).—3 h.p. Matchless-Jap twin, 3½ h.p. P.V.-Jap twin, and 3½ h.p. New Hudson III. B.

"P.M.P." (Altrincham). — Smith's speedometer, 3½ h.p. 1912 clutch model B.S.A.

"B 3669."—5 h.p. A.J.S. with and without sidecar.

"H.G." (Sherborne).—Binks carburetter on four-cylinder F.N.

A STUDY IN EXPRESSIONS.

A passenger machine in the A.C.U. one-day "trial" was assisted by willing hands on the 1 in 4 gradient of Cudham, which fact appeared to be amusing to everybody except the driver! The passenger seemed to be particularly elated. We wonder if his expression changed when he heard of other passenger machines which stopped at the self-same spot.

A Novel Waistcoat.

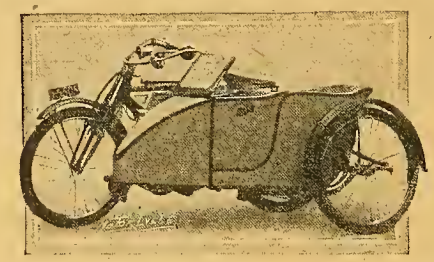
Messrs Harrison and Co., 76, Finsbury Pavement, E.C., have introduced a novel form of waistcoat which possesses several peculiar advantages. It is very light and weighs only 1 lb. It buttons up tightly round the throat and over the chest, and being made of linen enclosing two layers of waterproof paper, and lined with flannelette, is extremely warm. It also possesses the further advantage of being very moderate in price.

Company Notices.

On page 1193 of the *London Gazette*, 16th February, a statement appears to the effect that the Rom Tyre and Rubber Company, Limited, in pursuance of Section 188 of the Companies (Consolidation) Act, 1908, will hold a meeting of creditors for the purpose provided in the said section. We are asked to point out that the said notice refers solely to the 1908 company, which was bought up by the Rom Tyre and Rubber Company (1909), Limited.

Of Interest to Lancashire Readers.

A depot has been opened at 19, Hardman Street, Manchester, by Messrs. Kemps, vulcanising experts, for repairing and retreading covers and fitting new butt ends to air tubes. The same firm is acting as wholesale stockists for Robert's belts, non-skid bands, clip-on gaiters, etc.



Tourist's Handbooks.

A handy pocket book has lately been introduced by the Homeland Association, Ltd., Chandos Chambers, 15, Bedford Street, Stand, W.C., entitled "Our Homeland Churches and How to Study Them." The illustrations are particularly good.

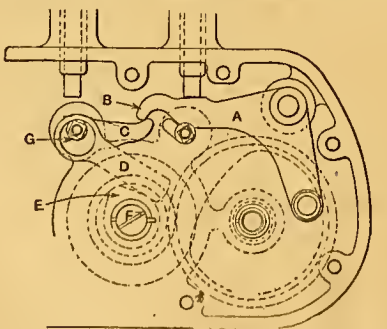
The Tulip Sidecar.

The accompanying illustration shows an original sidecar called the Tulip, made by Mr. M. J. Varley, 57, Stoney Lane, Birmingham. The body is made on the lines of a car body and the seat is adjustable, while underneath there is a

toolbox; there is also another under the footboard. The wind screen has patent joints which enable it to be adjusted to any angle. The chief feature of the chassis is the tube being set down from the main back axle, thus giving a drop of about 5in. The springs are C-shaped and shackled. On the rear axle is a smart luggage carrier which turns on three T lugs, and can be used as a stand.

Catalogues Received.

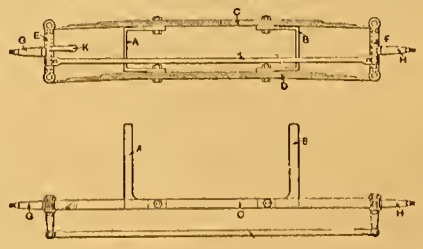
The new Humber catalogue is a handsome brochure, which, besides describing in detail and illustrating the various different models, also contains an entertaining account, with illustrations, of the Junior T.T. Race. Sections of the free-engine hub and two-speed gears are also included, besides drawings and descriptions of the important parts which go to make such a successful machine on road or track.



If any prospective motor cyclists are hesitating whether to adopt the pastime or not, and had an opportunity of glancing through the Clyno Engineering Co.'s latest catalogue—"The Book of the Clyno Sidecar"—they would hesitate no longer. In this book are reproductions of many interesting and exciting incidents in the career of the Clyno machine, many of the illustrations having already been published in these pages. Of course one must not forget the descriptions and illustrations of the 5-6 h.p. Clyno sidecar model with two-speed gear, also the standard machine, Colonial model, and detail illustrations of the power unit and transmission. Copies can be obtained on application to the firm at Pelham Street, Wolverhampton.

The 1912 catalogue of Royal Ruby motor cycles, sold by the Royal Ruby Cycle Co., Great Ancoats Street, Manchester, has been received. The illustrations show that the standard model has a frame with the top tube dropped at the rear. Druid spring forks, front wheel stand, kick-up back wheel stand, and tubular luggage carrier. The models listed are 2½ h.p. and 3½ h.p., with Roc two-speed gear and free engine. Two types of frec engine clutches can be supplied to order, the D.H.K. and the Villiers.

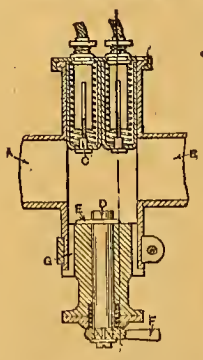
A Decompressor.



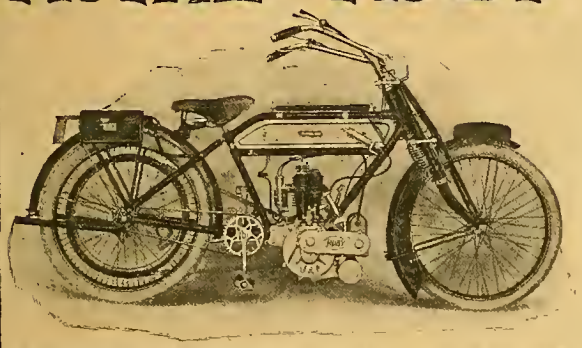
Although this invention has been patented by the Triumph Co., it must be understood that it is not at present being manufactured. The principle of its operation consists in raising the exhaust valve slightly for a part of the compression stroke, and the means whereby this is effected is shown in the view of part of the timing gear given. The usual exhaust valve rocker A is provided with an extension B, which is engaged by one arm of a bell crank lever C, the other arm D of which lies in the path of a

cam E carried by the pinion F. The device is illustrated in its operative position, and it will be clear that slight rotation will bring the swell of the cam E into engagement with the arm D of the lever C, resulting in the exhaust valve being lifted; and this is timed to take place during part of the compression stroke, with the well-known result. To enable the lever C to be moved into and out of its operative position, it is mounted upon an eccentric G, to which is connected a control device of any suitable kind.—Triumph Cycle Co., Ltd., and A. G. Franklin, No. 4,772, 1911.

Tricycle Spring Suspension.



The accompanying elevation and plan illustrate a spring suspension for tricycles having two front steering wheels. Bolted



to the longitudinal frame members A B are laminated springs C D, the ends of which are formed to receive swivelling standards E F carrying the wheel axles G H. The standards E F are provided with a tie rod J, and a steering arm K is carried by the standard E.—A. H. G. Girling, No. 1,269, 1911.

B. and B. Carburetter Improvement.

The carburetter body is of cruciform shape, A being the extra air inlet and B the gas outlet. These passages are controlled by slides C as usual. The fuel jet D is variable, being provided in the construction illustrated with an eccentrically mounted cover plate E, carrying a lever F at its lower end to permit of easy adjustment. The main air enters by the ports G arranged around the jet nozzle, and the columns of air thus formed impinge on one another and upon the jet of fuel, assisting in forming an intimate mixture. In a later model these holes are placed higher up and can be covered by a slide.—C. Brown and Brown and Barlow, Ltd., No. 1,412, 1911.

ROYAL RUBY

All machines guaranteed.

ROBERT BEVAN, Castle Street, CARDIFF.

£50,000.

This represents the value of new machines now in the course of being delivered at Hitchen's, of Morecambe. They comprise: P. and M.'s, Scotts, Jap-Bats, chain drive, and 3½ h.p. belt drive, with P. and M. two-speed gear; Matchless, 5-6 h.p. and 7-8 h.p., besides the No. 7 passenger model; Clynos, with and without sidecars; Zenith, 3½, 6, and 8 h.p. models; Humbers, lightweights, with and without three-speed gear, also 3½ h.p. two-speed gear models; Premiers, lightweights, with and without three-speed gears, also 3½ h.p. two-speed gear models; Lincoln Elks, lightweights, 3½ h.p., with and without two-speed gear, also free-engine models; Bradburys, chain drive and belt drive, two-speed gear, also single gear and free-engine models; Rudges, ordinary models, free engine, and multiple-speed; Douglas, all models; Motosacoches, all models; Indians, clutch model and two-speed; F.N. ditto; Triumphs, ordinary models and free-engine models; A.C. tricars; Morgan runabouts; Turner's light petrol car; Rolla cars, and several others, and THE BEST OF THE BEST in the Motor Cycle and Light Car productions.

We have these machines coming in to our order each week, and we believe we are correct in stating that we have the largest stock of new machines for sale ever gathered under one roof. It is not a misplaced title to call our Garage the "Olympia of the North."

The reason we have a greater stock than all other people is because we have not indulged in the luxury of booking our stock in advance, preferring to get the stuff and risk finding the customers afterwards. By doing this we are saved a good deal of unpleasantness ourselves, and it saves much irritation to our clients, and, altogether gives more satisfaction than would be the case if we rushed into booking orders on the strength of our contracts. There are none of the high-class makers to-day in a position to deliver up to contract, practically all of them being behind for one reason or another. We could have sold most of our contracts at and about show time, but after our experience of PAST SEASONS we decided to adopt our present attitude, and we have, so far, not had any cause to regret it, as we have been able to find customers week by week immediately the machines have been ready for delivery. We shall continue to follow this course of procedure all through the season, and you can always rely upon Hitchen's, of Morecambe, having machines in stock, or coming in within the course of a few days, that is, subject to the makers not getting any further behind with their deliveries.

In MANY OF OUR CONTRACTS we have as many as **12** machines of one make per week coming through later on in the season, and at the present moment as many as 4 coming through each week; so you will clearly see we are **prepared** for the **boom**, and CUT OUT TO DELIVER machines without the previous irritation and vexations. We hope our clients WILL BEAR THESE THINGS IN MIND, as we are wishful to drive these facts home, and feel sure that a buyer of a machine would much prefer to deal with us than to book his order with a firm who merely HAS THEM ON ORDER, and who may or may not be in a position to give reasonable delivery.

With us a WIRE or TELEPHONE CALL will at once give you the information required. We have often thought how few people appreciate the advantages offered by the use of this handy mode of communication. For a matter of sixpence or a shilling you can speak to Hitchen's, of Morecambe, as comfortably as if you were by our side in the Garage. We ourselves never lose any opportunity of speaking to a client if we know he is on the telephone. Distance is altogether immaterial to us; so long as we know that he is on the telephone, we try that way to bring a deal off. When you write us, please say if you are on the telephone; and if so, give your number, and intimating what time you would like us to ring you up. We shall always be pleased to do this, and make no charge for the accommodation. Our clients have thus a chance of speaking to Hitchen's, of Morecambe; and if there is any prospect of our arranging a deal, we are "on the jump" to bring it off. If you have no telephone of your own, you can visit a friend who has, or call at the nearest telephone office, and by paying for one or two calls you can, in a general way, fix up any deal that you may have in your mind. Our number is "112, Morecambe." If you call us up in the morning, say before **ten o'clock**, or in the afternoon after **four**, there is a good chance of your having a clear line, as at these times there is not much doing, as compared with other times during the day. Or again, if you call us up after six in the evening, we believe we are correct in stating that you will get six minutes for the same price as three minutes during the day, and as we are open until eight o'clock at night, there is a chance for the business man to fix up his private matters after he gets home at night. If you are wanting to buy a machine quick, there is no better system than this.

If, however, you do not feel interested in the telephone, remember that a telegram is just as cheap, and sometimes cheaper. If neither mode meets your views, you can always fall back upon the marvellous "penny post." We mention "penny post" specially, because many people seem to have an idea that it is possible to send a letter for halfpenny so long as they leave the envelope unsealed. This is not so, and if you only put halfpenny stamp on, Hitchen's are charged a penny before they get the letter. The Government are giving pensions at seventy years, with hopes of them at seventeen in the sweet by and by, also giving you ninepence for fourpence, and other luxuries, but persist in asking a penny for the carriage of a letter.

In writing to us it is a good plan to put your name and address on all your communications. We get a dozen letters and postcards every week without names on. Sometimes we can send them to the address, but more often than not the only place we can put them is to consign them to the waste paper basket. This is a pity, as it is a waste of energy on the part of our correspondents when this is all that we can do with them. Then again, another peculiarity of some of our clients is to put their name and address on the first letter they send us, and only their initials on their subsequent communications. All our correspondence is filed away every morning under the letter of their names, and unless you write full name we cannot trace.

Let's have that p.c. for list sharp.

HITCHEN'S, Morecambe.

'Phone: 112.

Telegrams: "Motor, Morecambe."

LUKIN SINGLE CONTROL CARBURETTER.

EXTREMELY SIMPLE. ABSOLUTELY AUTOMATIC. VERY FLEXIBLE.

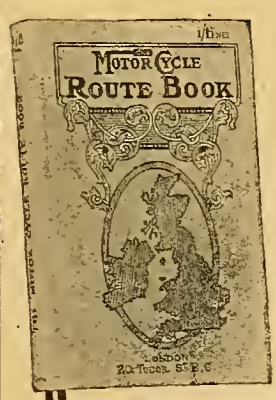
"The Motor Cycle" says:—

"... We have had the opportunity of giving it (the Lukin) a thorough road test on one of our machines. The Lukin has given great satisfaction under all conditions; it enables the engine to run extremely slow (slower in fact than any standard carburetter we have tried) and at the same time the engine will pick up at once on suddenly opening the throttle, without any of the hesitation which is a feature on only too many present-day carburetters...."

A rider who uses a Triumph machine fitted with the Lukin says:—

"... I need hardly add that the engine keeps much cooler when using the Lukin, as the mixture is always correct...."

A rider who uses a Rudge machine fitted with the Lukin says:—



"... I am getting over 100 miles per gallon. I fully endorse all you say with regard to the merits of the carburetter, which is so much pleasanter to drive with, especially in traffic, than the old-fashioned two-lever type...."

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 14 words or less 1/6, and 1d. per word after. Each paragraph is charged separately. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor Street, E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should state distinctly under what heading and in what issue the announcement appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

CLASSIFICATION BY LOCALITY.

For the convenience of purchasers of second-hand motor cycles, the advertisements are classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Plan showing division of England into Sections.

SECTION I.
Northumberland, Cumberland, Durham, and Westmoreland.

SECTION II.
York and Lancashire.

SECTION III.

We cannot possibly be beaten for price and our Exchange Terms are the fairest and most liberal in the trade. Send details of your used motor cycle, and receive our handsome offer of utmost value in part payment of a new model.

WAUCHOPE'S,
9, SHOE LANE,
FLEET ST., LONDON, E.C.

'Phone: 5777 Holborn. Wires: "Opificer, London."

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

TRUE VALUE.
SPRUNG LIKE A CAR.

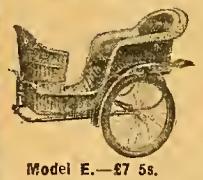
FARRAR'S SIDECARS are sprung both fore and aft, **CLEAR OF THE FRAME,** on special springs which are **UPTURNED C** shape at both ends, a refinement found on no other make. **THEN AGAIN, Note** where the front arm grips the centre of the sidecar frame, and compare this with the lopsided attachment adopted by some makers.

No need to fit extra supports to these sidecars.

CARRIAGE PAID.

We now pay carriage on our sidecars to any address in the United Kingdom.

The following refinements are fitted to all models. No extra charge whatever:



1. **Kick-up Stand** for jacking up sidecar wheel for tyre repairs.
2. Large sized **Cocoanut Mat** fitted to foot of sidecar.
3. **Special Sidecar Lamp** (plated), and fitted to show white light at front and red light to rear.
4. **Extra Rapid** Quick Detachable Joints.
5. **We pay carriage to any town in the United Kingdom.**

Model de Luxe.—£6 5s.

Model C.—£7.

Model E.—£7 5s.

Model D.—£8.

All complete with Michelin or Continental tyres. Customers have option of car or round pattern mudguards. Discount to the trade.

Any model can be supplied with tip-up basket without extra charge.

"Built to an ideal— not to a price."

The 1912

REX-J.A.P.

Represents the highest standard in Motor Cycle construction.

LOOK THE FIELD OVER—Go carefully into the specifications of other Motor Cycles; compare every detail; note the construction, engine, tyres, springing, control, style, finish, and refinements; examine EVERYTHING; don't miss a single point; when you have done this there can be but one conclusion, viz.: that the

1912 REX-J.A.P.

is the undisputed PEER of them all; the climax of engineering skill coupled with the highest attainments of the designer, with all the weaknesses and imperfections so noticeable in the COMMON PLACE eliminated. : : : : : : : : :

"BUILT TO LAST," the REX-J.A.P. is THE machine for Sidecar work, and can be relied upon to give good service under any conditions.

Catalogue free upon request.

The Open Road.

THE open road! What vistas does it not call forth? Free to tour from one end of the land to the other, untrammelled by trains, and the consequent servility to timetable and confinement in stuffy carriages! The glorious pastime of motor cycling, never dead throughout the year, is about to gain a new lease of life from the improvement in roads and weather. The old enthusiast has obtained delivery of his new mount and is eager to test its capabilities o'er hill and dale, while the tyro is on the verge of tasting the joys of a nomad. Both are free to wander where they list, nothing daunts them; no acclivity on a main road is too steep for the modern motor cycle to ascend; no declivity too precipitous for it to descend, depending on its powerful brakes and the retarding influence of the engine. In fair weather or foul a motor cycle can be ridden practically anywhere, and so the open road is free to all to go where they like, stay as long as there is leisure or the will to admire some pretty view, to inspect some ivy-mantled ruin or other object of interest that meets the traveller's eye. If a stretch of country with which familiarity has dulled his sense of interest intervene between the rider's residence and the object of his goal, no hard labour of limb is entailed in swift passage on to pastures fresh and scenery untried; districts hitherto unexplored are easily attained, and then, having tasted the joys of speed for fifty miles or so, the throttle may be partially closed, and, with engine just turning over, the new country may be carefully examined. The holiday at an end, there is no vague wondering whether physical fitness will allow a pleasurable return home, for the engine does the work, and head winds are of little avail to stay the power of the present day motor cycle. The sea coast is within the reach of the most Midland of Midland dwellers, even though he have only a couple of days in which to accomplish the journey there and back. For some years past the pastime happily has lost its selfish aspect. Time was when it was regarded as a somewhat lonely sport to ride a motor bicycle, mile after mile, without a companion. Now, with the aid of a passenger attachment, pleasure may be shared with others. Nothing exceeds the delights experienced by those who, having themselves enjoyed the beauties of their country, are with the aid of a motor cycle enabled to take a friend to participate in their pleasure. Old scenes may be visited with a keenness enhanced by the interest of a companion to whom they are all fresh, and there is the same, or even greater, pleasure in pointing to all the beauty spots so often visited before, as if it were the first occasion of their discovery.

Such are the delights of the open road, but to those who are about to commence the pastime of motor cycling this year it may be opportune to give warning of its dangers, in no wise terrible for those who are willing to exercise reasonable care, but sufficiently fraught with risk to warrant the practice of a certain degree of caution. The open road is just as free as of yore, but the speeds attained by modern traffic necessitate wisdom in entering main thoroughfares from by-lanes and roads. Never cross a main artery without sounding the horn loudly, nor at a faster speed than will allow an almost instantaneous stop and dismount, should other swiftly moving vehicles be passing that way. Be certain both brakes are in order, and never descend an unknown hill at a fast speed without having a clear view of the road for at least a quarter-

mile ahead. When ascending hills never take a corner at speed unless you are sure the road beyond is unimpeded, and never cut in on the wrong side at a corner. However difficult the hill may be, far better is it to ride slowly; rather fail and make another attempt than risk a collision at a bad corner. When passing or overtaking horses drive as quietly as possible, and under no circumstances leave the cut-out open when riding through villages and towns. In overtaking any other form of traffic give as much warning of approach as possible, and do not cut in immediately after passing; when passing allow as much room as convenient, and do not shave other users of the road. However certain one may be of a capability to steer to an inch, others are not always so adept, and nothing unnerves a fellow cyclist or motorist more than to ride too close. In strange country look out for speed limits, for these have increased of late and the signs indicating their whereabouts are often obscurely placed.

THE AUTO CYCLE UNION SILENCER TRIALS.

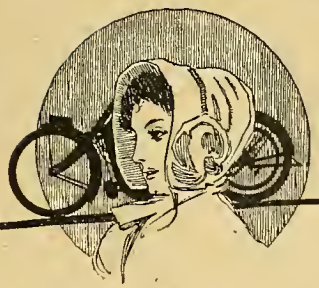
THE arrangements for the silencer trial to be organised by the A.C.U., the date of which will be announced shortly, are practically complete. The silencers will be tested on a 500 c.c. water-cooled engine to which will be attached a fan brake. The engine will be run at from 750 to 1,000 r.p.m., and will be placed against a wall with the silencer outside. On this engine various types of silencers will be fitted and tested. Complete machines may also be entered. What constitutes the desired degree of silence will be arrived at before the date of the competition by fitting to a motor bicycle a silencer consisting of two cylinders sliding one inside the other. They will be adjusted until the whole committee agrees that the exhaust is reasonably quiet, and then the capacity of this experimental silencer will be communicated to the entrants to serve as a guide. Naturally, this exhaust box may not be of normal size, but this will not matter, as it is merely intended to reduce the noise of the exhaust to a point which is not objectionable to the ear. The Manufacturers' Union will be asked to co-operate with the A.C.U. in organising this trial, as the Local Government Board, as is generally known, are shortly to issue regulations regarding unduly noisy motor bicycles. Further details will be announced at a later date.

THE TOURIST TROPHY RACES.

IT is left to private riders to decide whether they will do their best to organise an amateur race for 1912, and agitate for the resurrection of the T.T. Race on the old lines in 1913. Two things are obvious. The first is that the T.T. Race is a great nuisance to the trade. It comes at the busiest season of the year, it costs every competing firm vast sums of money, and only two or three of them reap any real kudos. The second is that we private owners foot the T.T. bill; if a manufacturing firm spends £1,000 on the race, as one firm is alleged to have done last year, that money is distributed over the touring machines sold by that firm, in the form of advertising charges. Purchasers and vendors have to consider whether a genuine return is received for the large outlay.

I cannot endorse the ostensible reason put forward by the trade for the suspension or abolition of the T.T., namely, that it is of no real service in developing the tourist mount. We owe a great debt to the T.T. It has given us engines which can climb gradients fast, it has given us engine flexibility, it has given us durable engines with lots of stamina, and it has greatly accentuated the factor of reliability in every detail of the modern machine. Last year it added the special service of demonstrating the variable gear.

Brooklands can certainly take its place in respect of some of the above items; but a race on Brooklands can never adequately test engine flexibility or variable gears. No sane man wants a flexible engine for track work; no sane man would dream of using a variable gear in track work, except to snatch a few seconds vantage at the start of a short sprint event. But increased engine flexibility and increased demonstration of variable gears are two of our crying needs just now; and therefore the abolition of road-racing would be to this degree a calamity.



I must say I take a most pessimistic view of the Six Days' Trial, as at present conducted; it does not supply so exhaustive a test as the T.T., and its regulations bristle with loopholes which enable a clever rider utterly to falsify the comparison of leading makes with which it is intended to supply the general public. If a bad machine enters for the T.T., it is inevitably and ruthlessly shown up; if a bad machine enters the Six Days, it may emerge with shining credit.

New Machines Gain Much Kudos.

Industrially, another great value of the T.T. is the high relief into which it throws a new machine of high quality. I suppose hundreds of men will ride 2¾ h.p. three-speeded Humbers in 1912, for instance. How many would have sold but for the Junior T.T.? And in days when the market is bewilderingly flooded with a myriad makes, many of them "dark horses," the buying public need such honest pointers as the T.T. provides.

B. H. DAVIES.

THE MOTOR CYCLE FROM A LADY'S POINT OF VIEW.

ONE does not require the genius of Sherlock Holmes to perceive that the motor cycle is daily becoming more and more popular with the weaker sex, and rightly so, for now that makers have realised that the lady motor cyclist is worthy of consideration, they have produced many excellent machines of all weights with open frames suitable for ladies' use. A list of these will be found in "The Buyers' Guide" published in *The Motor Cycle* of November 16th and 23rd last. The weights of these machines vary from 105 lbs. to 200 lbs. For novices the lighter machines are most certainly to be recommended, partly because they are more easily handled when the rider is dismounted, but many experienced riders prefer the heavier patterns. Some ladies even reject the machines specially designed for their use, and make their choice from the bicycles built for men.

Open Frames or Not.

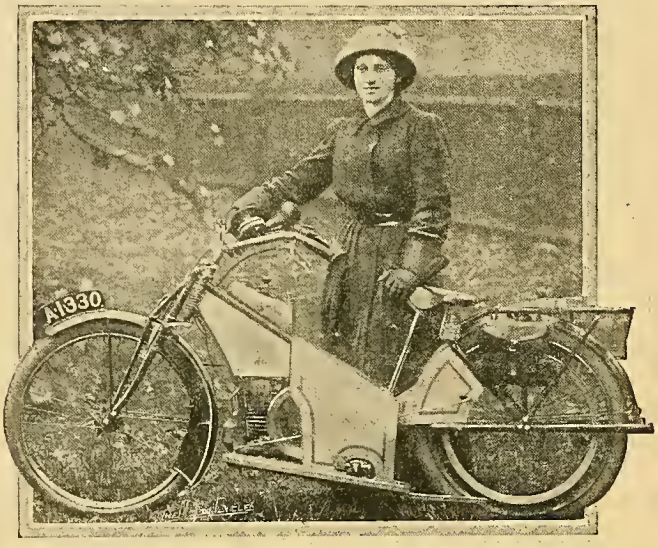
This practice, however, can be condemned for two very good reasons: (1.) The difficulty of satisfactorily and gracefully disposing of the skirt—few ladies care to wear a costume which can be considered suitable for the purpose, as, although it may be inconspicuous when riding, it will invariably attract unpleasant notice when off the machine. (2.) The impossibility of mounting and dismounting really quickly; in the case of mounting this is a minor consideration, but there are sometimes occasions when one's safety may depend upon the ability to dismount quickly. On the other hand, with the open frame no fantastic garb is required. The skirt, a rough tweed for preference, should be fairly short. A Gabardine or waterproof coat should be worn, according to weather conditions, and a leather or wool waistcoat with long sleeves adds much to the rider's comfort on cold days. The hat should be small and fit closely.

Miss Mina Spiers, of Dunedin, New Zealand, who is a keen rider of a 2½ h.p. two-speed A.J.S. Miss Spiers is the first lady motor cyclist in Southern New Zealand.

Competitions.

Another open question is whether reliability trials and hill-climbs are really desirable from a lady's point of view. There is not much, perhaps, to be said against the former, though the majority of lady riders prefer to use their machines only for rides and tours with their own friends. Some ladies, however, enjoy entering competitions, preparing their mounts for the event, the excitement on the day, the chance of a winning place—all these things appeal to their sporting instincts, and it must be granted that they often perform particularly well.

Motor cycling is undoubtedly a fine sport for both summer and winter. What is more invigorating than a run on a bright frosty day? Answer: Two runs. Practically the whole day can be spent on the road in summer without undue fatigue.



Can Ladies Attend to their Mounts?

It has often been said that ladies have no mechanical turn of mind, and so motor cycling would not appeal to them. The following will show that they are not so helpless as they are supposed to be. Two ladies had been using a sidecar continually in rain and mud, so one can judge the condition of their mount after such weather. It was decided that for the New Year it should be completely overhauled, and that they themselves should do it.

The machine in question is a 3½ h.p. (two-speed Roc) Brough (ladies' model) and sidecar. The first thing was to rid the machine of superfluous mud, which had found its way into every possible nook. Next it was thought necessary to adjust the gear, so it was decided that the back wheel should come out and be thoroughly cleaned before any adjustments were carried out. This completed, both front and sidecar wheels were cleaned and the hubs lubricated; also the spring forks were in need of oil.

Now the most important part, the engine. First the plug was taken out and the points cleaned and put close together for easier starting. Next the valves were ground in and new valve springs fitted; then the carburetter was taken off, the jet cleaned, and the shutters and springs of the B. and B. control oiled.

The Motor Cycle from a Lady's Point of View.—

Miss Rose Hammett, one of the most successful and experienced lady motor cyclists. Her mount is a Douglas. During 1911 Miss Hammett registered over half-a-dozen successes in competition.

Replacing the back wheel proved to be the worst part of the whole business. However it was managed; then, after careful adjustment, both gears worked perfectly, and the brake acted as it had never done before. Finally a run on the stand completed the preparations for further enjoyable trips.

Points in Design.

Ladies' machines have not yet reached the same degree of perfection as those of the opposite sex, the open frame and the necessary protection for the dress, simplicity, cleanliness, etc., being in a large way accountable for this.

Manufacturers are now alive to the fact that there are many ladies who would rather drive and look after their own mounts than sit snugly in a sidecar, watching the sometimes futile efforts of a companion to coax an underpowered combination uphill.

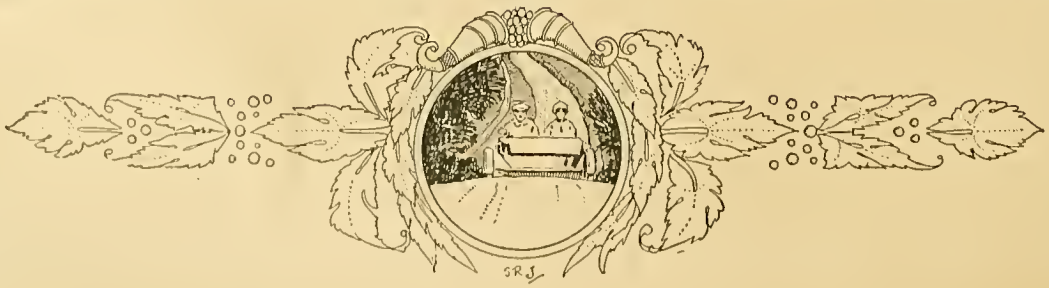
To my mind, the three chief factors which seem necessary for the making of the ideal machine for a lady's use are:

1. Very low saddle position.
2. Simplicity of control.
3. Lightness with plenty of power.

It ought to be possible to put the foot flat on the ground and yet be seated comfortably in the saddle—a position in which it would not be difficult both to steady the machine and push off while letting in the clutch.

A short time ago I noticed a young lady struggling with a machine turned out from the factory as a lady's motor cycle. She could only just reach the ground with the toe of her shoe, and thus could not properly support the weight of the machine. The control of the clutch was on the handle-bar, and the lever actuating this dropped so far down that it was well nigh impossible for the small hand to grasp both and pull them together to declutch. She, however, succeeded in performing this feat. Then came the grand final, viz., pushing the machine along while gradually letting in the clutch, and at the same time controlling the engine to take up the load by means of the other two levers on the opposite side of the bar. Needless to say, when the clutch lever was let down as far as the dainty fingers could reach, it was loosed, with the result that the already hot engine, after one or two plucky attempts to keep going, accompanied by terrible knocks, stopped.

Supply and Demand.



This proceeding was repeated twice before the usual inquisitive crowd, and then the lady's efforts were successful, and she sailed away, the poor little engine still knocking. This incident makes it evident that there are many extra little details to consider when designing a lady's motor cycle.

Miss Downie, of Edinburgh, who is a devotee of the motor cycle, her mount being an open frame 2¼ h.p. twin Forward.

When you read of, and meet on the road, ladies riding men's machines, it seems very much as if the demand for ladies' machines exceeds the supply, or is it that a man's motor cycle is so much more reliable?

DIANA.

Occasional Comments by "Ixion"

Experimental Work in Variable Gears.

Fortunately, the evolution of variable gears is by no means standing still. Behind the scenes the leading inventors and engineers are working in frenzied but conscientious fashion at gears far surpassing the best now available. Several three-speed and variable devices have reduced a two-speed gear to the position of a temporary compromise. The need for a small engine pulley on three-speed machines on which the central ratio is direct has shown another loophole for progress. I should not be in the least surprised if within the near future we are offered a three or four-speed counter-shaft gear (possibly even "infinite"), with the T.T. type of two-nut detachable rear wheel, a belt drive that will last 5,000 miles comfortably, no small pulleys, light weight, and a high reliability factor. It looks as if we two-speed faddists have been asking for too little through the long, weary, hopeless years of our past campaign.

Alleged Vibration with Chain Drive.

In our issue of March 7th "A.M.I.C.E." (p. 239) made what struck me as a distinctly rash induction. Comparing two machines, one of which was belt-driven, the other chain-driven through a clutch, he noticed that a long ride on the chain driver proved more fatiguing, and he attributed the extra fatigue to "the unrealised tremor or vibration, caused by the chain links striking the (sprocket) teeth, affecting super-sensitive nerves." This is rather a large generalisation to draw from a single comparative test; the comparative test of two machines is a very complex matter, embracing hundreds of factors; for instance, the engine on a chain-driven machine is usually much more substantially built than on a belt-driven machine; saddle and handle-bar position enter into the question; spring forks and their efficiency are most vital, etc. As my readers know, I am habitually a long distance man: I do not consider I have had a ride unless my speedometer trip dial shows an access of 200 miles or so; and though I am not at present a chain drive enthusiast, I hold no brief for the belt as a final and ideal transmission—in fact, owing to many of its disadvantages I dislike it, but regard it as temporarily a good compromise.

I cannot endorse "A.M.I.C.E." in his generalisation. Sundry long distance rides stand out clearly in my memory as having fatigued me excessively, and the majority of them were accomplished on belt-driven machines. So far as I can identify the main cause of the fatigue, it has invariably been due to some factor quite apart from the transmission regarded as a producer of vibration, or the reverse. In one case it was a peck of punctures; in another, a broiling sun; in another, the strain on wrists induced by constant correction of side-slip; in another, extreme cold; in another the strain of undue speed; in another, anxiety about hill-climbing; and so on.

Comparing these glorious no-trouble cross-country runs from one end of England to the other, which stand out so happily in a veteran rider's memory, I can recall no variations of fatigue due to the type of transmission employed. On such occasions I have finished quite as freshly on a single-cylinder chain-driver as on a twin-cylinder belt-driver; and I think most riders of equal experience would confirm this view.

One must admit that a few years ago the dampers fitted to chain transmissions in the way of spring washers and clutches were not remarkably efficient, and a single-cylinder chain-driver, climbing a hill barely within its compass, used to thump a bit, but this thumping would only be physically deleterious to a very sensitive rider, and would only be perceptible for brief patches of the ride; nor even then could it affect the user so seriously as a bad riding position, or a rigid or bouncy fork.

Nowadays, if you close your eyes, the senses can barely detect whether the drive is by chain or belt, so admirably is the snatch of the chain damped by cushioning devices inserted in the drive.

The Angle of Radiating Fins.

I am inclined to fancy we are likely to become a little too superficial and cocksure on the question of the correct angles for radiating fins. It is very dubious whether the same angle can suit engines placed vertically and tilted either forwards or backwards, or, again, whether one angle can be best for singles and twins. There must be an extraordinary medley of cross currents, when we allow for rebounds both from the cylinder walls and the upper and lower surfaces of fins, for altered angle of impact due to head draughts, side winds, and following winds, and the general disposal of currents on the rear cylinder of a twin must especially be enormously complicated.

If we were likely to confine ourselves to air cooling for ever, it would pay some expert in wind currents to make prolonged and exact tests under all conditions for the benefit of the industry. At present the situation is as follows: At the start of the motor cycle era a few makers adopted a certain design because it was easy to manufacture and neat in aspect; and as it worked fairly well, the main bulk of designers have followed suit. The design which was adopted for one particular type has been thoughtlessly retained for nearly every subsequent type, though in many cases the conditions have undergone radical alteration.

It is improbable that by a gigantic fluke the original design attained the maximum of efficiency, and still more improbable that the same happy-go-lucky plan has retained maximum efficiency through many later modifications of the conditions. I am not at all sure that side-plates (possibly perforated), designed to prevent draughts bouncing off the cylinder and fins into space after infinitesimal contact, might not secure improved cooling in many instances, especially in track work, where a head-on blast is always the main factor.

Sir Wotabout Knut-errant-

By Fred Gillett and G.E. Shepheard

1.

Now at this gladsome season of the year
When Spring puts forth her this-year's-pattern buds,
And roadsides deck themselves in flowery gear
And lay aside their best assorted muds,
It doth behove me in these present pages
To tell of those who lived in the dark ages.

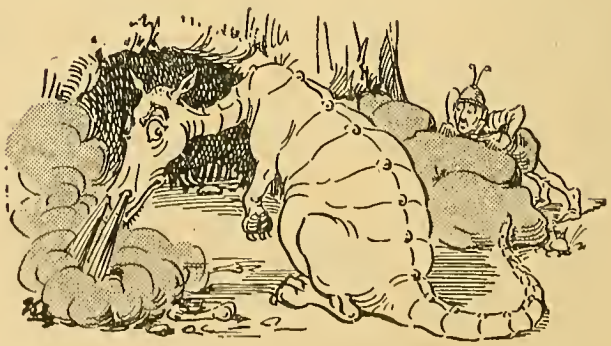
2.

Therefore, without excuse, I tell the tale
Anent Sir Wotabout, a worthy knight,
And Lady Helen de la Farthingale,
And several other people, who have quite
Escaped the pen and memory mementive
Of ancient bards—my own is more retentive.

3.

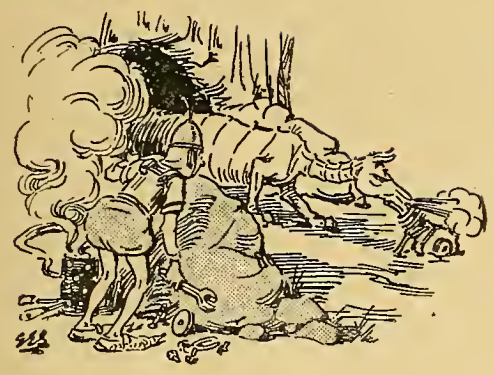
The Lady Helen was the only child
Of Baron Brasted, who a castle had
Upon a hill. The Baron often smiled
Because that hill was steep, its surface bad.
And suitors riding up to woo his daughter
Failed on the one in seven-and-a-quarter.

4.



Helen by all the gallant knights was wooed.
Some came on horses, slow and tortoise-like;
And some in carts laborious and crude.
But no one came upon a motorbike,
Because no motorbike was on the market
In those dark days, not even a Noah's Arkette.

5.



In consequence, their lack of dash and speed
In climbing up the Baron's steep front drive
Made the good Baron very vexed indeed,
And he declared "Till someone looks alive,
Eftsoons! and does this measured furlong well in-
Side seven seconds, none shall wed fair Helen!"

6.

This caused dismay among the knights, who knew
Their chance to gain fair Helen's hand was nil.
The Young Sir Wotabout despondent grew,
Yet by an extra effort hoped on still;
For, as he stood apart and muttered, "Had I
A motorbike!" Helen gave him the glad eye.

Sir Wotabout, Knut-errant.—

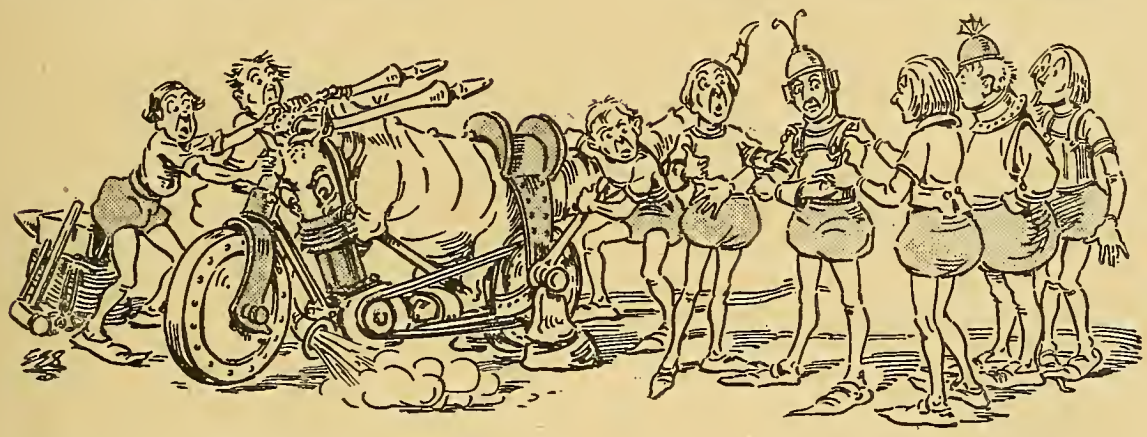
7.

At this he hied himself unto a cave
Where dwelt a dragon. Here Sir Wotabout
Observed the dragon snort red fire, and rave,
And breathe blue smoke and thunder from its snout.
"Methinks," thought he, "this dragon hath possession
Of motive power, but badly lacks compression."

8.

That night Sir Wotabout went forth to snare
The dragon by a trap adroit and neat.
He placed a cylinder outside its lair
Fitted with valves and piston all complete,
And when the dragon placed its head unsightly
Therein to search for nuts, he brazed it tightly.

9.

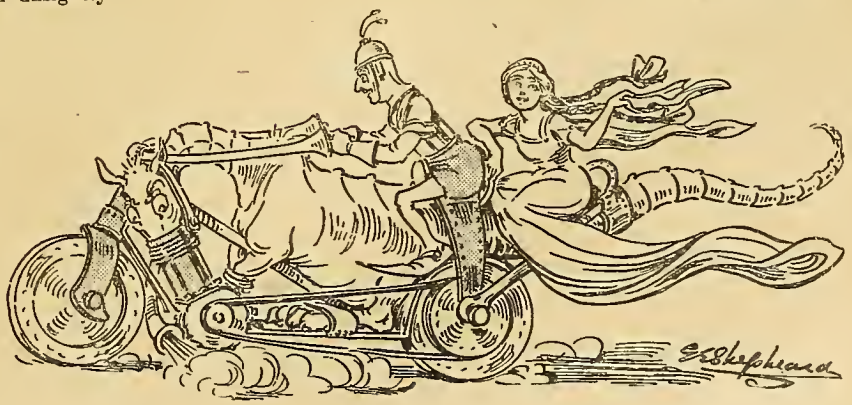


The captured dragon coughed, and gave a hiccough;
The valves opened and closed in strict rotation;
The piston fearful speed began to pick up
At each terrific gurgling exhalation.
Placed on two wheels, with belt, belt rim, and pulley,
It answered speed requirements very fully.

10.

His friends advised him not to ride the thing,
It was, they said, both dangerous and noisesome.
But youth, they knew, of course, must have its fling.
Sir Wotabout determined to enjoy some,
And having tuned his steed and cut the cackle,
Resolved the Baron's hillclimb next to tackle.

11.



Upon that hill Sir Wotabout achieved
A Dark Age record time, and without fail
The Baron him with open arms received,
So did the Lady Helen Farthingale;
And when the day arrived for him to marry her,
The dragon's tail supplied a splendid carrier.

12.

Moral:—if any—Some who have not tried
The joys of motorcycling still regard
The engine as a monster close allied
Unto the dragon or the fearsome pard.
Those who have not yet passed through petrol's stages
Are still existing in to-day's Dark Ages.

FRED GILLETT.

HOW THE POWER OF AN ENGINE IS TESTED

THIS article is penned for the benefit of those of our readers who do not get the opportunity of seeing their engines tested. In it the writer will endeavour to explain as simply as possible the various methods now in use to ascertain the b.h.p. and to compare their merits and demerits.

The Brake Test.

The brake-horse-power of a motor may be obtained in several ways. The type of apparatus most commonly employed in the automobile industry till recent years is known as the "Prony" or "Brake" test. The apparatus is simple and the mathematics required are of the most elementary kind. Referring to the sketch, F is a pulley driven direct from the engine-shaft. Above and below it lie the wooden brake blocks A clamped to the beam B by means of the bolts C, which can be easily tightened by means of wing nuts. E is a spring balance anchored to the floor and attached to the beam by means of the screwed bolt G.

D is a counterpoise arranged so as exactly to balance the projecting arm of B and also the weight of E.

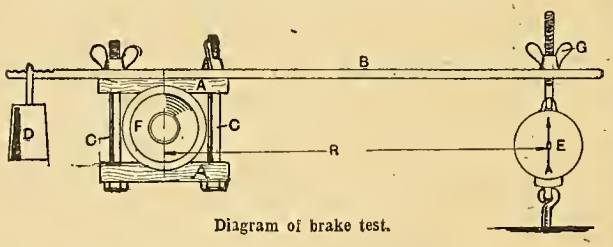


Diagram of brake test.

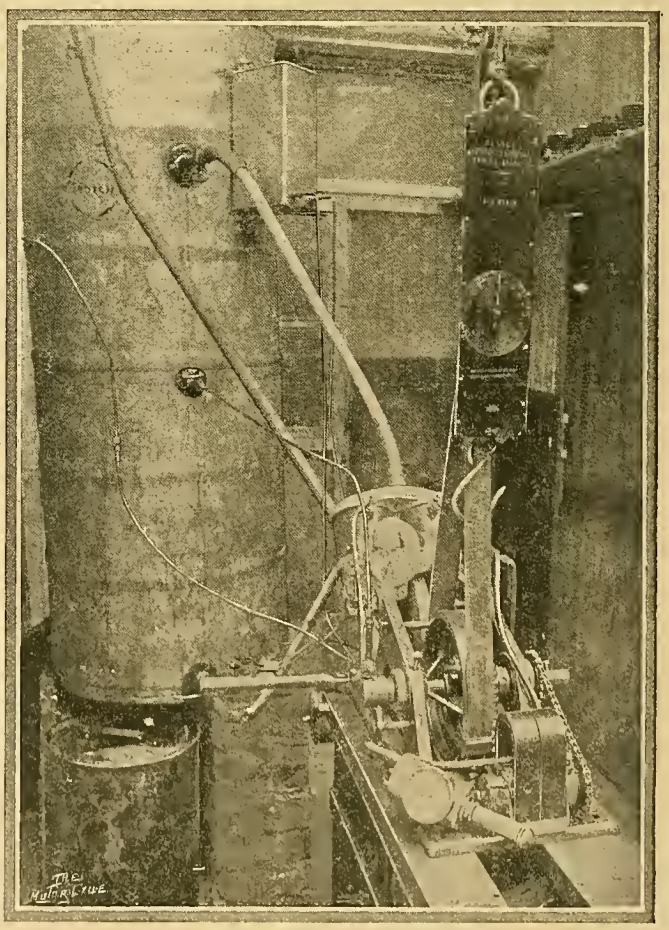
At the commencement of the test the beam B must be horizontal. The engine is now started and the brake blocks tightened by means of the wing nuts on C. The engine is fully opened up and the blocks tightened until the engine just maintains the speed at which the test is to be taken. B is then again brought horizontal by means of the wing nut on G. Now the exact engine revolutions are noted by means of a tachometer, and also the reading in lbs. on the spring balance E. To arrive at the horse-power of the engine we have now but a simple sum:



Let $\pi = 3.1416$
r = Horizontal distance from centres F and E
n = Engine revs. per minute
P = Reading of E in pounds

Then h.p. $= \frac{2\pi r n P}{33000}$ Since $\frac{2\pi}{33000} = .0001904$ we may take the latter figure as a constant, and say that the horse-power equals $.0001904 \times r \times n \times P$. The above figures are reliable and may be found in Mr. O'Gorman's motor pocket book.

This test, though simple, is usually a messy proceeding, as the brake blocks have to be copiously oiled to prevent their firing and the oil is thrown everywhere by the pulley. It has therefore been modified in several ways, one of which is used by the Scott Engineering Co., and is worthy of a description.

A Modified Form of Prony Brake Test.

First of all, the engine is bolted down to a heavy iron stand and coupled up to temporary petrol, water, and oil tanks. The engine is then started and allowed to run for three hours at a pace varying from 3,000 to 5,000 revolutions per minute. After this the revolutions are lowered to about 2,000, and the brake test is then applied. In this instance the engine is coupled up to an ingenious water-cooled brake drum by means of chains. The place of the brake blocks and beam is taken by a flat belt passing under the drum and attached at each end to separate spring balances, one of which acts as a positive and the other as a negative balance. Deductions are made from the ensuing readings, and when the engine pulls from 5-6 brake-horse-power it is passed as up to standard, though as much as 7 horse-power has been obtained.

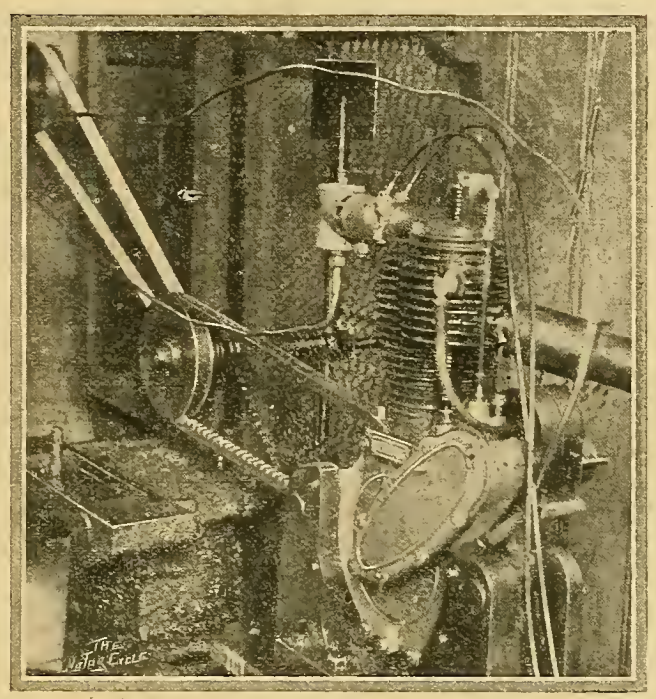
A Scott engine undergoing bench tests.

How the Power of an Engine is Tested.—

After leaving the test shop, the engine is erected in its frame and undergoes further severe road tests, the report on each machine having satisfactorily to answer seventy-nine questions.

The Fan Brake.

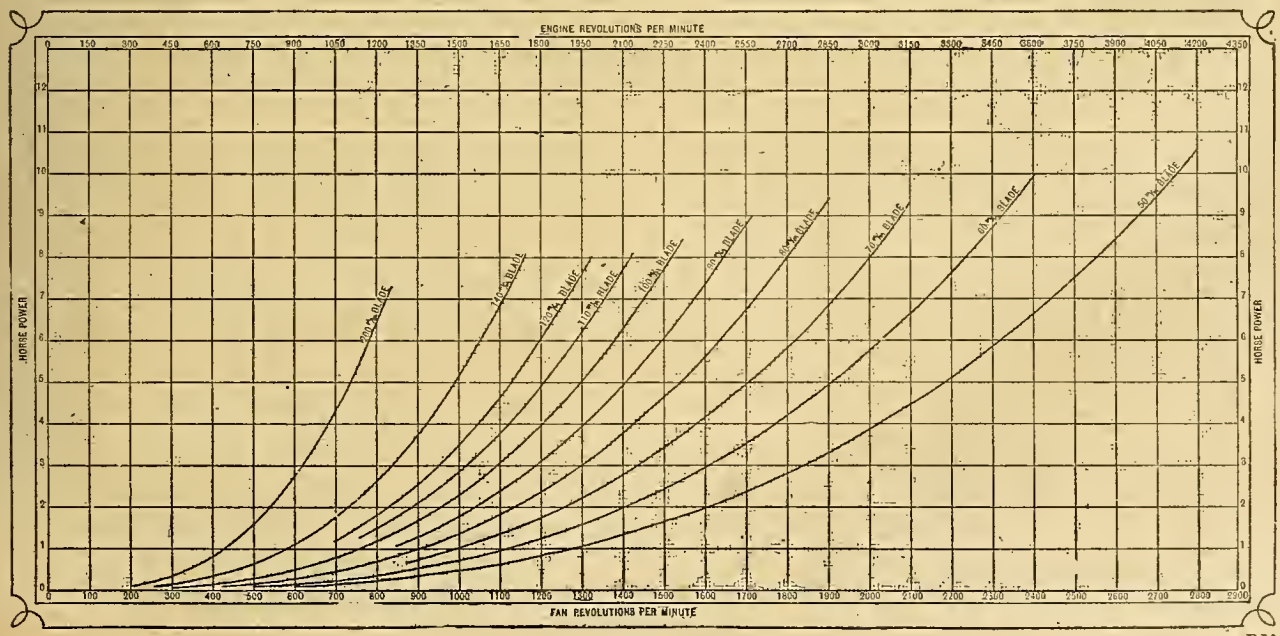
The fan brake, which is now becoming common, is even simpler and cleaner. The system is as follows: Two arms are formed by a single stout forging, which is carefully balanced from the centre, and is coupled to the engine-shaft. At the extremity of each arm a flat plate is attached (as may be seen from accompanying sketch). The power required to drive these plates through the air at certain speeds is worked



Design of fan brake.

out in the form of a curve. The speeds in fan revolutions being set horizontally and the power required vertically, curves are worked out to suit plates of different areas. Once the curves have been plotted it is only necessary to affix the fan blades, start up the engine, and open the throttle till maximum revolutions are obtained. The revolutions are then checked accurately by means of a tachometer, and it is ascertained from the curve what power is required to drive the blades at this speed.

By the courtesy of Rudge-Whitworth, Ltd., we were permitted to watch a test and take the photograph reproduced herewith. A short description of the testing arrangements may be interesting. The engine is bolted down to a heavy cast-iron stand placed in front of an electrically driven blower, which when necessary can force a draught of sixty miles per hour. In this case the fan blades are fixed to a counter-shaft and driven by a V belt, the counter-shaft being geared down 2 to 3. From this counter-shaft runs another belt visible in the photograph, which drives a tachometer giving the engine revolutions per minute.



The accompanying chart shows curves worked out for eight different fan blades, varying in size from

A Rudge engine undergoing the fan brake test.

50 mm. square to 200 mm. square. The horse-power is given vertically, the engine revolutions horizontally at the top, and the fan revolutions at the bottom.

To take a simple instance (not from an actual test). Suppose the 80 mm. blades were in use, and the engine when opened out succeeded in revolving at 2,400 revolutions per minute. The counter-shaft is geared down 2 to 3; therefore it revolves at 1,600. On following the vertical line between these points, we find that it cuts the curve for the 80 mm. blade at a point rather more than halfway between the 5 and 6 horse-power lines, showing us that it requires 5-6

BI

How the Power of an Engine is Tested.—

h.p. to drive the blades at the above revolutions. It will be noticed from the photograph that the fan blades are enclosed in a stout wood and wire frame. This is a very necessary precaution in case a fan arm should burst. The writer has seen an arm break close to the blade, when testing a car engine, and though the broken part weighed probably less than a pound, it cut right through the wooden roof of the test shop and broke about a dozen slates. Besides cleanliness and simplicity, this test has another very real advantage, viz., that the engine can be run at full load for long periods without attention to the fan.

The Electrical Test.

There is another form of horse-power test which, though used for testing car engines, has not so far (in the writer's knowledge) been used for motor cycle engines, and therefore needs but a short description. This is the electrical test.

For this test the engine is coupled direct to a dynamo, the output of which is measured in "watts" (volts × ampères), 746 watts = 1 h.p. Before accurate results can be obtained the efficiency of the dynamo must be ascertained. Quite a large number of firms give their engines no bench test and rely entirely on the ascent of some well known test hill as a trial of engine power. For this system it may be claimed that the engine is being driven under actual conditions, but unfortunately it is impossible to eliminate the personal element, and a clever tester can do wonderful things with only a moderately powerful engine. UBIQUE.

A NIGHT RIDE IN THE LOW CYCLECAR.

IT was a dark and foggy night when the opportunity came for accepting the long-standing invitation. The fog was of the clammy variety which rendered things generally unpleasant. "You mustn't mind if it is not pulling," said Mr. Low. "The compression has fallen from 800 to 350 lbs. per square inch." No, this is not a peep into the future, but an actual fact. I had not fallen asleep after a heavy Christmas dinner. I was really talking to the inventor, and in a few minutes was behind him in the converted cyclecar propelled by the wonderful forced induction engine.

Petrol was first injected into the cylinder jackets, the exhaust lifter was raised, and the compression reduced thereby to about 30 lbs. per square inch, and the engine pulled over. This sucked the petrol through the trip valves into the cylinders, and the engine fired. The exhaust valve was dropped, and the forced induction, caused by the heat of the explosion raising the temperature of the petrol and increasing the compression pressure, began.

The Noise of the Exhaust.

The first thing noticeable was the noise of the exhaust, a totally different sound from the ordinary engine with cut-out open. It was the sharp, ear-splitting sound of the high explosion.

We often hear a noisy engine likened incorrectly to a Maxim, but this absolutely describes the exhaust of the Low engine. It fired beautifully on the high-speed trembler coils, and, smoothly getting under way, Mr. Low swung the machine out of the side turning into the open road. It was pitch dark, but the keen eye of the inventor steered us clear of all obstacles. The driving mist obscured my vision completely; blurred lights sprang up and disappeared; the beats of the engine increased in rapidity; we sped along I knew not whither. Suddenly lights sprang up all round, we were again among civilisation. Quickly I gauged my bearings; we were on a hill. Ere I had realised it, we were up in less time than it takes to write, and had it not been for the glare of electric lamps, I should never have realised we were on a gradient.

The sense of power was delightful, and the bark of the exhaust lent a touch of interest which I would not have been without for worlds. We turned about, sailed forth again into the darkness, entered the lanes once more, slowed down at a few corners, and were home. No, I did not wake up to find myself in a comfortable armchair at 3 a.m. shivering in a cold room; I was actually wiping real fog from real glasses and brushing real mud off a real coat sleeve gathered from several times putting on recalcitrant belts which would jump off.

"I must apologise for this exceedingly poor performance," said Mr. Low. "The loss of 450 lbs. compression makes, of course, a considerable amount of difference to the power. You see, the trip valve springs are too weak, and their lift had to be restricted. The petrol, instead of being injected during half the stroke, is only being injected during half an inch of the stroke."

"Quite so," I replied; "but it is hard for one not accustomed to this engine to realise. I noticed the buzz of your coils gave a very high note. I suppose the tremblers have a very high speed?"

"Yes," replied the inventor, "though the engine, when hot, will fire without a spark. The long, lasting spark during the whole stroke enables the mixture to be fired comparatively slowly and the pressure to be maintained throughout."

The Method of Control.

"How do you control her?" I asked.

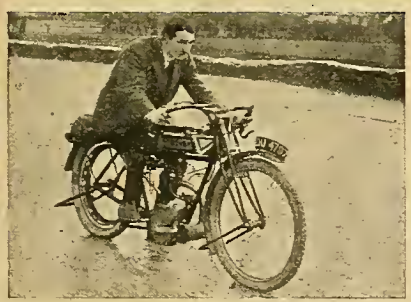
"By the exceedingly crude and unsatisfactory method of using the exhaust lift, and by opening or shutting the cock on the pulsating pump delivering petrol from the tank to the jacket, which regulates the pressure of the petrol vapour, and consequently the quantity injected. In the new engine, which I hope to have out in a couple of months, I shall govern by the oscillating valves, and by these I hope to get an engine as flexible, or nearly so, as a steam engine.

"One word before we say good night. I have never let her out, but were I to do so when she was in tune I should do sixty miles an hour." "I believe you," I replied, "were the belts to hold." "There you have it," answered Mr. Low, "the new engine will be fitted to a chassis which has some positive form of transmission."

"Is there any truth in the rumour that you will enter a machine fitted with this engine for the T.T.?" I asked. "Yes," said Mr. Low, "I hope to." "Well," I replied, "I wish you the best of luck with it. If any man deserves success you do." And with that I said good night. E.M.P.B.

CLIMBING HONISTER PASS

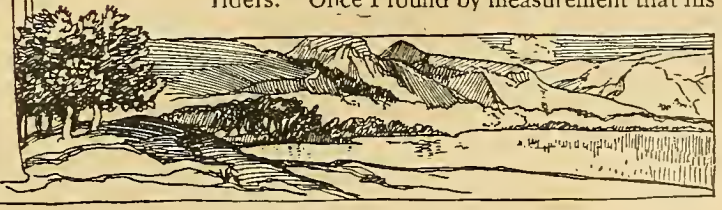
RED BANK, GRASMERE & KIRKSTONE PASS from Ambleside.



A WEEK-END IN LAKELAND

Frank Smith (5 h.p. Clyno), with R. H. Bell as passenger, starting for Honister.

B. Haddock (2½ h.p. A.J.S.) at the top of the steepest pitch on Honister.



Vernon Taylor (3½ h.p. T.T. Rudge), who climbed the Pass with a single gear.

A FORTNIGHT ago Honister Pass, Cumberland, had not been successfully climbed by a motor cycle of any description, but now, thanks to the enterprise of a number of riders, who readily took up a challenge in the columns of *The Motor Cycle*, it can be said that a sidecar has succeeded, a lightweight machine, and also a single-geared heavyweight. Our last week's description of the events of the 9th inst. would make it clear that the test was not actually a fair one, on account of the impossible state of the surface, covered, as it was, with boulders and big flat shale. Further, an ascent is fraught with considerable danger on account of the sheer drop which everlastingly preys on the motor cyclist's mind as the long climb upwards is made. There were many opinions expressed as to which was the more difficult, a climb on a sidecar or on a motor bicycle. Personally I should favour a sidecar climb, as a slower speed is possible. Several times I was asked whether in my opinion the ascent was worse than Porlock, and Frank Smith agreed with me that, though Honister Pass is more difficult and dangerous, simply on account of the stony state of the surface, the gradient is not so severe as Porlock. A lot has been made of the stones having been removed from the steepest part, but as they were shovelled aside for but ten or twelve yards and at the point where a sudden diversion of the front wheel might conceivably spell instant death to someone, I can see no objection to this procedure.

The Question of Gear Ratio.

Several times one heard the comment that gear ratios alone decided success. That is certainly the case to a large degree, but, as has been pointed out before, an engine must be designed to suit its gear, or it could not travel two miles uphill culminating with half a mile of 1 in 7, with a stretch of 1 in 3½ thrown in. Try a low gear for a long ascent with a high compression engine, and the force of my argument will soon be appreciated.

Vernon Taylor (T.T. Rudge) was the one man who made the spectators quake. He is a most daring rider, and I knew that his third stop on the hill would have the effect of stirring him up. When he had got the belt at the right tension and his best gear ratio on, he travelled at a wonderful speed in view of the conditions. His machine was buffeted about in a way that would have stopped many less intrepid riders. Once I found by measurement that his

Climbing Honister Pass.—

wheel marks were within 18in. of the edge of the road bordering on the 50ft. drop.

Frank Smith, on his Clyno sidecar, and Hugh Gibson (Bradbury with empty sidecar) deserve especial congratulations, as they succeeded in their announced object at the first attempt.

Bert Haddock, who was mounted on a lightweight 2½ h.p. A.J.S. with a low gear of 17¼ to 1, told me that he guaranteed his machine to climb anything where there was a road at all. Truly we are coming to something when users of such diminutive engines express themselves so confidently.

The Second Day's Climbing.

Next day the members of the Cumberland County M.C.C. and the Westmorland M.C.C. had arranged that the party should attempt Red Bank, Grasmere, and afterwards Kirkstone Pass. Unfortunately, Hugh Gibson was unable to join the party owing to gear trouble, and his nerves were also very much upset by Saturday's exertions. There was quite a happy little gathering at Red Bank, Grasmere, which was reached after a magnificent run past Thirlmere, Grasmere, and Rydal Water, and the same success which Smith, Taylor, and Haddock had achieved on the Honister Pass climb was again their lot. This is not surprising, as Honister is admittedly the most severe test to which a motor cycle can be put. Red Bank is very steep and rather twisty, but the chief point is that the surface is good. Millburn and Gregson (Triumphs), Little and Gilbank (Rudges), made clean ascents of Red Bank. After photographs were taken, it commenced to rain very smartly, so a hurried move was made to Ambleside for lunch.

The first lightweight to ascend Honister—the 2½ h.p. two-speed A.J.S., ridden by B. Haddock.

Kirkstone Pass the Last Ascent.

In the afternoon the long ascent of Kirkstone Pass was climbed by Frank Smith (Clyno) and Bert Haddock (A.J.S.) without taxing their engines to the uttermost, and no doubt Vernon Taylor would also have been successful, but after about a mile and a half of climbing he imagined he was at the top of the hill, and pulled up. It is strange that the road appears to drop at this point, giving one the impression that the summit has been reached, but after running slightly downhill for half a mile one encounters the most difficult stretch of the climb. This portion is known as "The Struggle," and consists of a zigzag road, the gradient averaging approximately 1 in 6 for half a mile. One of the Westmorland members—L. Pierce (T.T. Rudge)—made the only non-stop ascent from Ambleside to the White House at the top on a single

THE LATEST PHASE.

It is well known what has been done and is being done with Dunlop tyres in hill-climbs, reliability trials, and all other forms of competition; here you see what you have never seen before, how a Dunlop stood up in a collision with a motor 'bus, —an unexpected trial of strength, out of which it came triumphant.

Mr. J. K. Orsman, 62, Old Woolwich Road, S.E., the owner of the machine, tells the story:—"I enclose a photo of my motor cycle and sidecar after collision with a motor 'bus. The Dunlop tyre on the front wheel, notwithstanding the impact, did not deflate or leave the rim, otherwise the machine was a complete wreck."

RELY ON

DUNLOP TYRES

FOR RESILIENCE AND RESISTANCE.

DUNLOP BUTT-ENDED INNER TUBES

are being more widely used this season than ever by all classes of motor cyclists. When a repair has to be made, there is no need to take out the wheel, to unscrew the brake fittings, or to interfere with other parts. Simply undo the flap, disconnect the ends, and draw out the tube. Repair and replace in the ordinary way, fitting the cover at the valve first and making sure that the flap on the tube is not creased. These advantages should be appreciated before the mishap: fit butt-ended tubes and save disagreeable jobs.

Prices, according to size, 11/8 to 16/-.

Climbing Honister Pass.—

geared machine during the afternoon. A number of other members were successful in climbing the pass in two stages.

Altogether the trip was much enjoyed. Lakeland appears to be an ideal touring ground for motor cyclists, and especially those sporting riders who never rest until they have climbed everything. The best thanks of the Midland party are due to the captain and secretary of the Cumberland County M.C.C.,

Vernon Taylor (T.T. Rudge) on the 1 in 3 portion of Honister Pass.

Messrs. Little and Millburn, for the arrangements they made, whilst Fred Greenwood knew everything.

Monday was the day for general dispersion. Haddock (A J S) continued his way over the Scotch border, Gibson (Bradbury) returned to Southport, and Taylor (Rudge) and F. Smith (Clyno) journeyed to the Midlands by road. I occupied the seat of the Clyno, and the morning being fine and the air crisp, once under way we lost no time. It was ten o'clock when we left, and we were both anxious to get home that day. Soon our good beginning was cut short by a curious trouble; the engine commenced to misfire, gradually stopped, and glancing downwards we found a collection of hoar frost on the carburetter. A frozen carburetter in March is not common, yet we were troubled for a long time in this wise. Once again over Dunmail Raise, on the second gear of 6½ to 1, we commenced to pick up time lost in thawing the carburetter. By the way, has any motor cyclist noticed that the milestones from Keswick to Ambleside are wrong way round? On the way from Keswick he

The hill-climbing party at Red Bank, Grasmere, overlooking the lake.

At the summit of Kirkstone Pass. F. Smith, W. M. Millburn, and B. Haddock.

milestones state distances from that town, and you have to crane your neck to find how far it is to the next village. This is contrary to the usual way of doing things, and it would be interesting to hear the local surveyor's reason for this unorthodox method. Also the bits of small granite scattered over this road for many miles were thrown into my face by the front wheel. Goggles were consequently a *sine quâ non*. The same thing happens on muddy roads. I wonder that some sort of mud shield to the front wheel has not been evolved for sidecar work.

We greatly enjoyed the ride past Windermere, and, in fact, were indeed sorry to leave the Lake District

Climbing Honister Pass.—

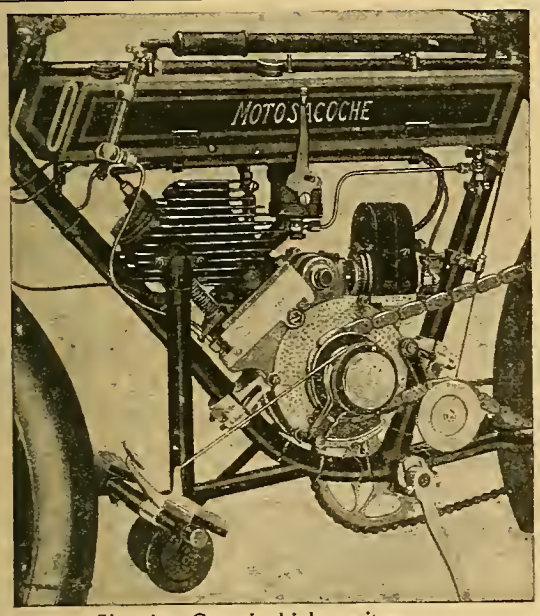
A striking snapshot showing the enthusiasm of the crowd when Frank Smith accomplished the first ascent of Honister.

behind. Near Lancaster an A.A. scout advised us of a long stretch of road under repair, and directed us down a by-road. We exhibited no badge.

There was a thick mist in the atmosphere as we approached the district so much dreaded by motorists—I refer to the Preston-Warrington-Wigan stretch. Instead of reeling off regular miles at 30 to 40 m.p.h. on deserted stretches of road, we crawled along, being bumped out of our seats by the pot-holey surface and big cobble stones. In the towns our progress was still further curtailed, as, owing to the coal strike, the streets were crowded. Once we were hailed by a Lancashire agent who was anxious to know the result of the Clyno trip. Having been informed that it had proved eminently successful, and everything attempted had been accomplished, he made us laugh by saying in the broadest Lancashire, "Well, you'll have to alter the name and call your machine the 'Clymb-ote.'"

Nothing eventful happened up to Congleton, Cheshire, where we halted for refreshment. On again to Newcastle-under-Lyme, we hurried along as fast as possible, the mist betokening that we were in for a foggy night, and we had still sixty miles to cover to Wolverhampton. I was particularly interested to observe that the Clyno engine was little, if any, the worse for its severe buffeting on Honister Hause. It responded to the throttle on every occasion, and the fact that throughout the 200 miles run home we never had occasion to drop below the second gear proves the power generated. Once again it is worth pointing out that throughout my experience of Clynos, extending well over 1,500 miles, I have not seen a plug or valve removed on the road as yet. This is the more striking when one remembers that Frank Smith does not spare the oil, and whenever he approaches a steep hill, glances round to make sure that his mascot, in the shape of a long blue reek, is in the rear.

I privately noted the petrol we took aboard. Starting with a full tank of 1¾ gallons, we bought half a gallon at Preston and another at Newcastle, and the total of 2¾ gallons would have seen us safely to Wolverhampton, where I was to board a train, had not the black night and thick fog compelled us to resort to the low gear for many miles; it was absolutely dangerous to attempt even 15 m.p.h. on the 3½ to 1 top gear. We lit up in Stone, Staffs, and the most exciting part of the journey followed. A couple of F.R.S. lamps exhibited a fine beam ahead, but it was reflected back by the fog, and we simply had to crawl along. Just imagine, we actually passed the most dangerous vehicle on the road, viz., a timber lorry drawn by three horses with a huge tree trunk extending for several yards in the rear—no light at the back.



In the Fog and No Petrol.

The excitement was not over. No sooner had darkness come on than our old trouble haunted us again, and every dozen miles or so we were pulled up to thaw the carburetter slides, on which ice formed, causing them to stick open.

Thus ended an eventful week-end and a varied day's run—first the lovely run through the Lakes with snow-capped hills on either hand, immediately followed by a nightmare of cobble stones and intricate tramlines of the thickly populated Lancashire manufacturing towns, next the barren Potteries district, and finally a foggy night as black as it ever could be in the noted Black Country. GEOFFREY SMITH.

The last half mile on Kirkstone Pass, known as "The Struggle," an appropriate title from a motor cyclist's point of view.

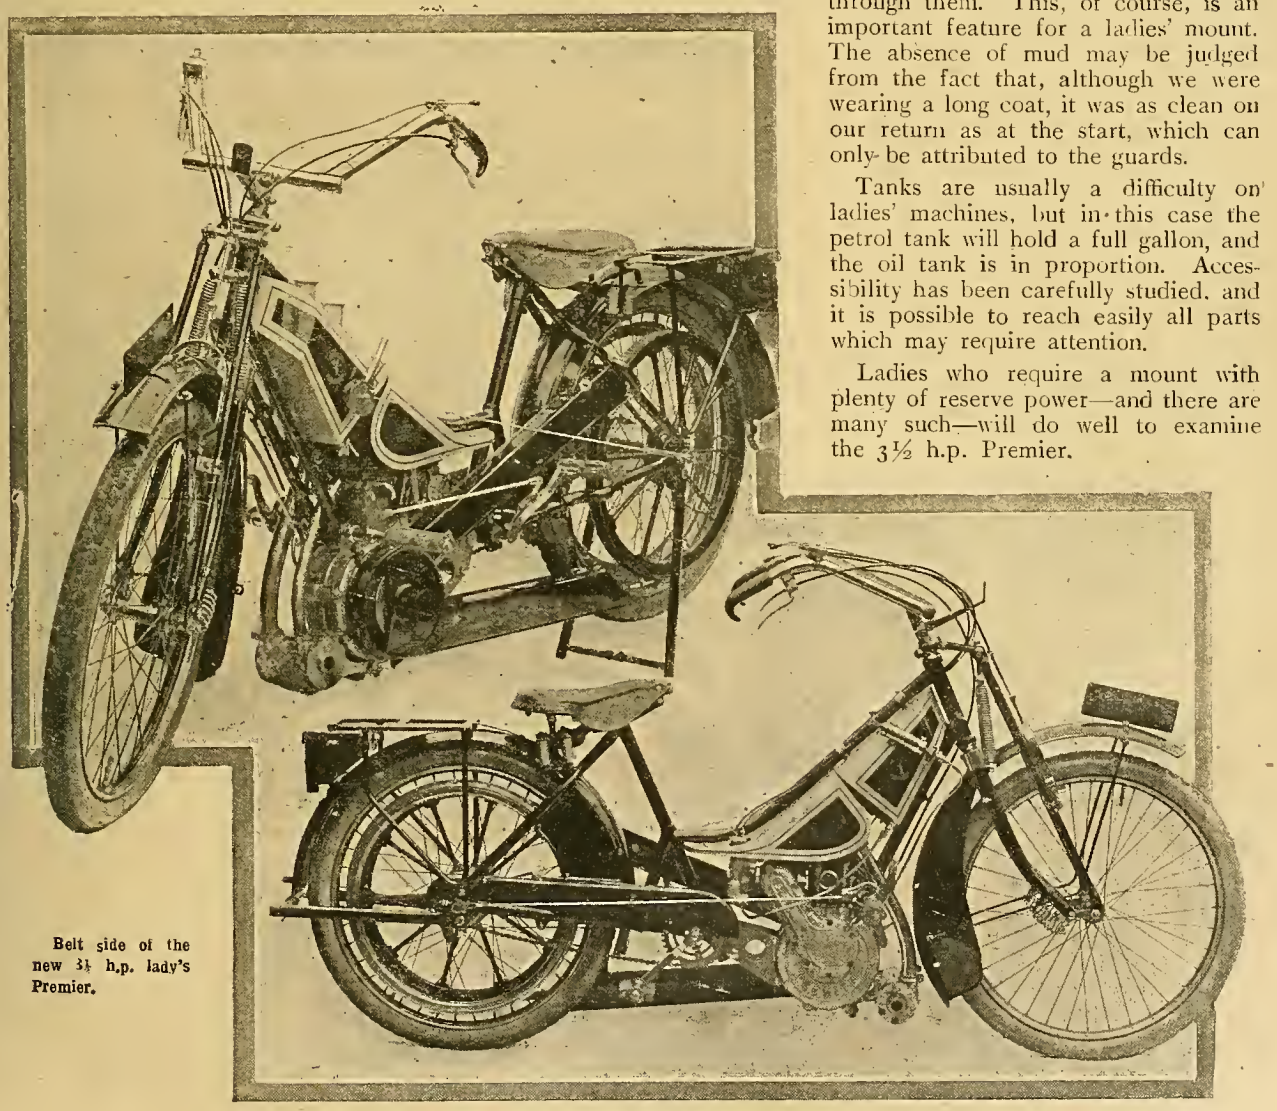
In answering this advertisement it is desirable to mention "The Motor Cycle."

A Run on a Ladies' Heavyweight.

THE Premier Cycle Co., of Coventry, is one of the few firms who have laid themselves out to construct a 3½ h.p. ladies' machine, and they have done this in response to numerous enquiries which they have received. It is, of course, more difficult to construct a neat-looking ladies' heavyweight than a lightweight, but the Premier Cycle Co. is to be congratulated on its success.

We outlined the general design of the machine in a recent issue, so that it is only necessary to point out that the front down tube has been replaced by two tubes of smaller diameter, and that the model may be fitted with either the Premier free engine or the Armstrong three-speed hub. It was the latter type which we were invited to try one morning last week, the road conditions at the time being adverse.



Having started up the engine, we took our seat, and were at once struck by the comfort and the ease with which the controls came to our hands. The machine glided away, and we were soon on the high gear, but deemed it advisable to drop down again to the middle or direct gear on account of the treacherous road surface. The engine pulled beautifully, and we found no necessity for racing the engine when starting up, the heavy flywheels taking up the drive comfortably and easily. As a test for the engine power, we changed into the high gear close to the foot of a fairly steep rise, and were delighted with the way in which the engine picked up and the machine sailed over. This will cause no surprise when we state that the 85 × 88 mm. engine is of identical design to the 3½ h.p. engine fitted to the diamond frame model.

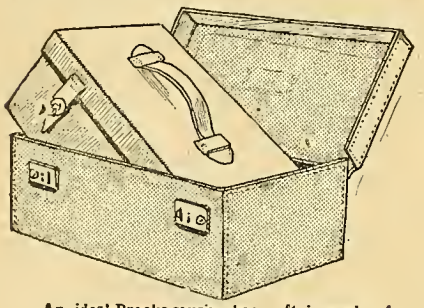
A Clean and Efficient Mount.

We found this mount handy in traffic and, above all, clean, thanks to the wonderfully efficient belt guards, which are formed like tunnels, the belt running through them. This, of course, is an important feature for a ladies' mount. The absence of mud may be judged from the fact that, although we were wearing a long coat, it was as clean on our return as at the start, which can only be attributed to the guards.

Tanks are usually a difficulty on ladies' machines, but in this case the petrol tank will hold a full gallon, and the oil tank is in proportion. Accessibility has been carefully studied, and it is possible to reach easily all parts which may require attention.

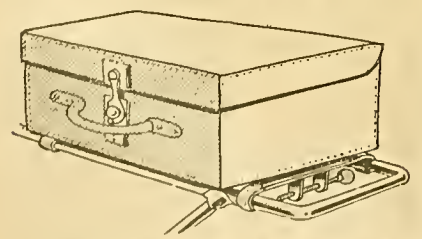
Ladies who require a mount with plenty of reserve power—and there are many such—will do well to examine the 3½ h.p. Premier.

Belt side of the new 3½ h.p. lady's Premier.



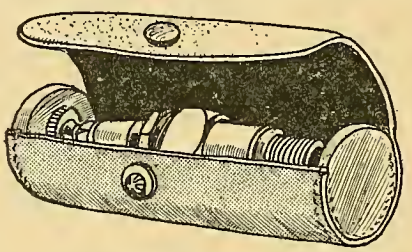
Broadside view showing dressguards over the belt.

TOURING EQUIPMENT.



By B. H. DAVIES.

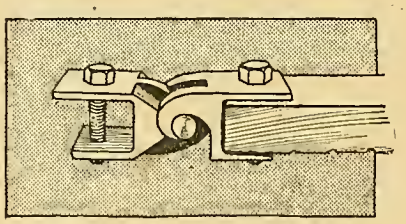
EXTREMES meet. In the accessory world the extremes are represented respectively by the youth with the Norman-arch back, whose kit is contained in a military hairbrush case, flimsily attached to his spring forks, and by the gipsy caravan type of rider, whose handle-bars sag disgracefully beneath his 8in. acetylene flare, his (electrically illuminated) speedometer, his (electrically illuminated) route card holder, his (pigskin cased) first aid outfit (at least, I suppose this is what those triangular handle-bar bags hold, I never had the temerity to open one), his thirteen club badges, his golliwog mascot, his eight-day clock, his



An ideal Brooks touring bag. It is made of stout leather, and has an interior casing to accommodate touring equipment, thus rendering the bag weather and dustproof.

Baby Klaxon, his Hampton Court maze hooter, and other trifles of ironmongery. His carrier stays sway and buckle under the swing of a top case containing his dress suit, panama, and sleeping kit, overlaid by three spare belts, two tubes, and a cover, all shrouded in more pigskin atrocities of various shapes and sizes, and the triangles at the side of the carrier are occupied by gigantic panniers enshrining more tools than a decent fitter would take out of store when he had to dismantle a motor 'bus. I loathe both types impartially; and, as I said, they often meet on the road, when the teeteeing type borrows a big wrench to straighten his front forks after colliding with a road hog perambulator, which was criminally meandering on the wrong side of the road, and the gipsy caravan proprietor has to unlash all his load before he can

Lycett's touring bag with special metal clips for attaching to the carrier. The latter should prove a great boon, as few motor cyclists have not experienced the trouble of leather fastenings breaking.



Forward leather sparking plug case. It is a necessary and useful covering to prevent damage to the plug.

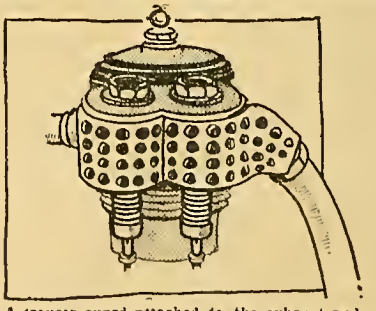
unearth "just the very tool for the job." After relashing, his language perfumes the circumambient air like a smoky exhaust.

The Toolkit

I counsel the juvenile and viridescent motor cyclist to deride both these sports, and to select a moderate and practical kit. The toolkit is the real essential, and may consist of a few simple instruments, which are rarely provided by the makers in an ideal form. I like one big spanner, say 8in., and one 4in. ditto. The latter with a screwdriver, a belt punch, a knife, and a belt fastener, will suffice for ninety-nine out of every hundred stoppages, and should, therefore, be kept in a stolen duster in a small push cycle bag strapped on anywhere; either the handle-bar or the side stay of the carrier is a good place. The screw

The Amac belt fastener which is specially suitable for high-powered machines.

driver should be expensive with a fine edge. If it be cheap the blade will fall out, or the handle be too thin to get a real twist on (as when a belt screw is rusted home); if it has a thick edge it is no use for belt fasteners. The combined belt drills and cutters are heavier and somewhat stiffer to use. It is true they do the job very accurately, but so does an ordinary screw drill punch of the correct size for the belt section, provided the user's eye is not inflamed with drink. Of course, if you use a drill punch with an opening for an inch belt on a ¾in. belt, and rest it against the corner of a stone wall, the hole will be out of truth, and the belt will pull through in twenty-five miles.



The main tool outfit will pack nicely into the little pannier bags provided by the makers. It is just as well to overhaul the fastenings of these bags. If they are fixed to the carrier by plain straight bolts with nuts about a quarter of a millimetre in diameter, you will ride pursued by a constant jangle until all your tools tumble off. Bent plates with strong bolts and D nuts are, however, absolutely reliable; so

NO NEED FOR A CAMERA TRIPOD.

The patent ball-joint camera attachment marketed by Brown Bros., Ltd., for attaching a camera to the handle-bars.
A. Screw for fixing camera. B. Ball-joint
C. Handle-bars.

is a good home-made bolt, cut off jaggedly with a hack saw, and burred well over its nut. A really good method of stacking the essential spare belt has yet to be devised. I have tried the flat round cases sold for the purpose, but not all of them have strong straps, and it is sufficiently annoying to lose a guinea belt without throwing in a 7s 6d. case. Personally, I like wreathing the belt tightly round the handle-bar or tank, and securing it with its own fastener or a bit of wire; if looped round the tank it will make a fine substitute for knee grips. The spare tube can be carried in the small leather collar

A trouser guard attached to the exhaust and inlet ports, sold by H. Holt & Co.

THE NEW
LODGE
MOTOR CYCLE SPARKING PLUG.

DESIGNED FOR MAXIMUM POWER.

The greatest test for a sparking plug is its use on a motor cycle, and it is of the utmost importance to secure the best possible plug.

The following are the reasons why the Lodge Plug is very strongly recommended as being the best.

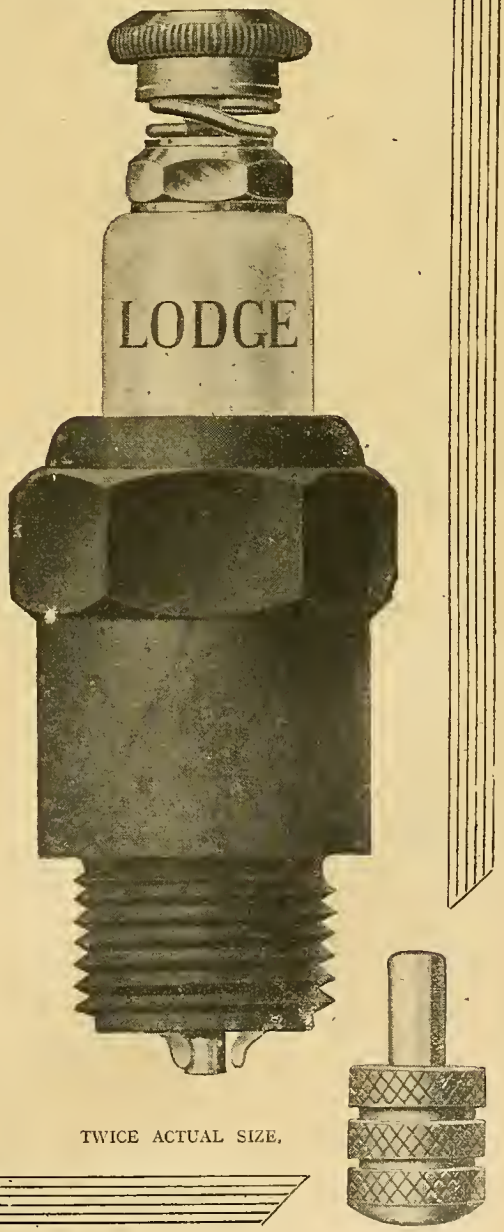
SPARKING POINTS.—The sparking points are so shaped that the greatest amount of heat of the spark is given up to the gas.

The shape of the points tends to expand the spark allowing for a very large spark at high speeds and yet giving easy starting. The points are also designed that they absorb the minimum of heat and cannot cause pre-ignition: being made of absolutely pure nickel they will not corrode away.

INSULATION.—The insulation is higher than that in any other plug. To test this make comparative measurements using an electrical insulation meter, and measure the insulation between the terminal and the body of the plug **when hot** and with the cable disconnected.

GAS TIGHT.—The plug is made solid with no packing of any kind, and is absolutely gas tight and will always remain so. To test this cover the outside of the plug with oil when any leakage would at once be apparent by the bubbles.

GUARANTEE.—The insulation will not crack nor is it possible for any part of the plug to come loose. It is for this reason that, however severe the working conditions, the makers can comfortably guarantee the plug for one year.



The plug will, of course, last for many years.

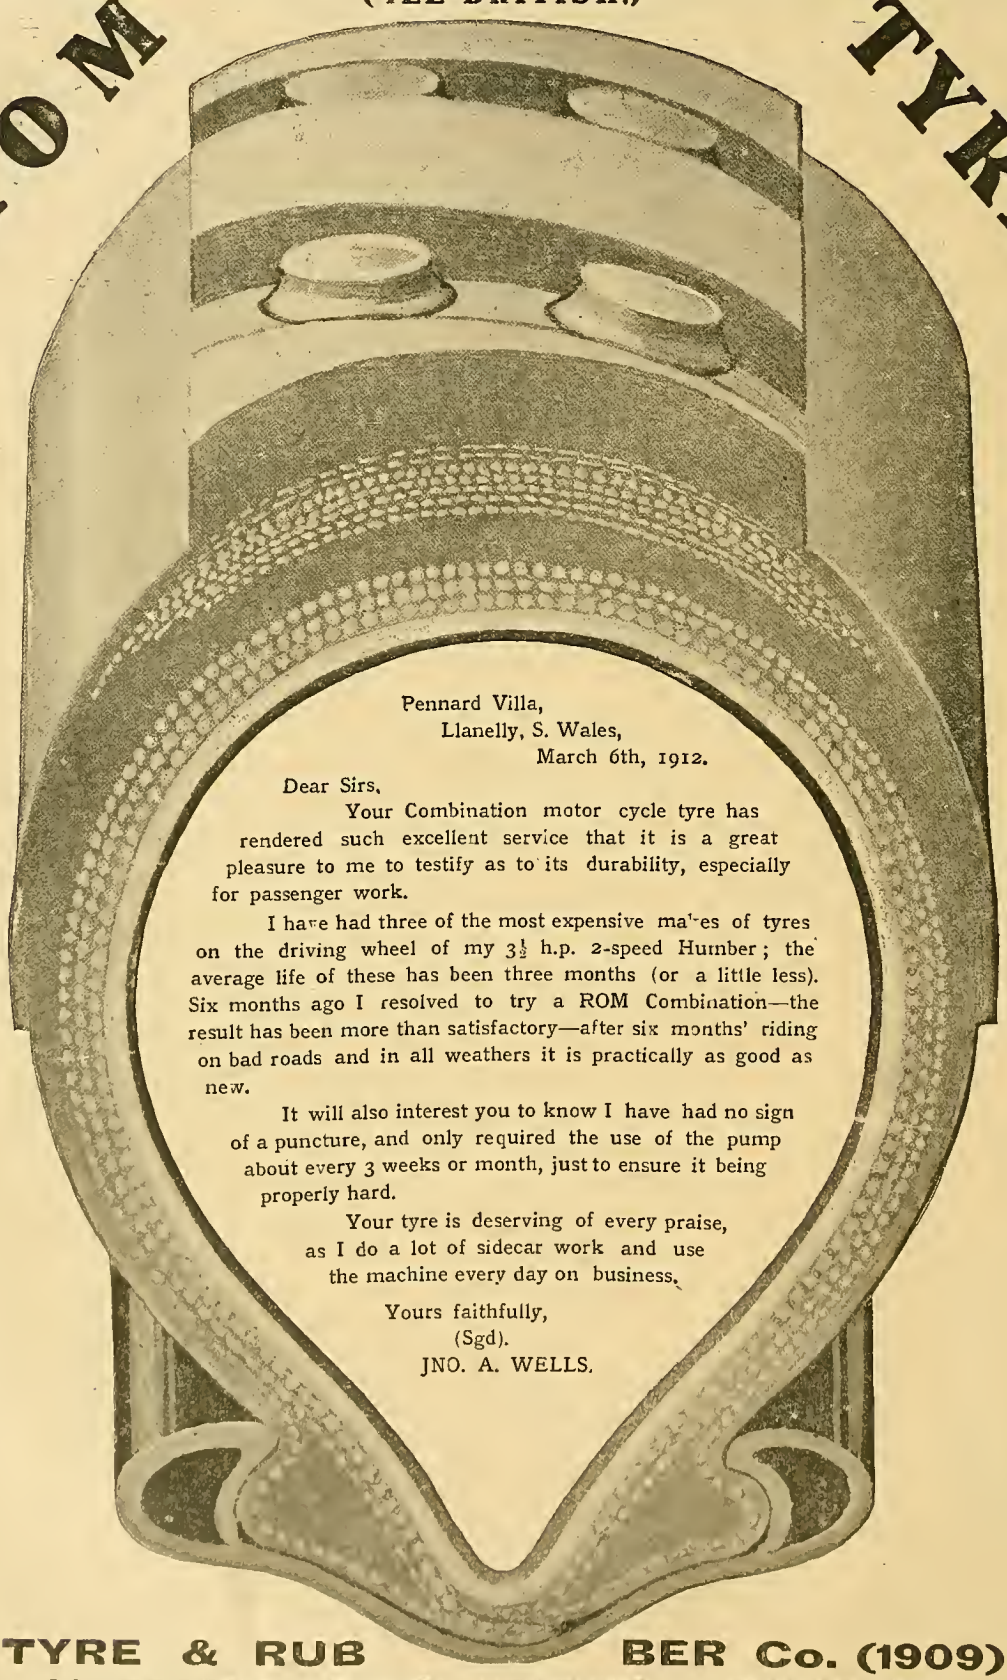
The Lodge Plug is supplied with a steel gauge for accurately setting the points.and with a push-on terminal.

The Plug can be bought everywhere, price 4/- net.

When ordering specify "Lodge Motor Cycle Plug," and they are packed in red striped boxes.

CAUTION.—There are some unscrupulous dealers who will offer another make of plug on which they secure a large profit, but if you are convinced that the Lodge Plug is what you want, you will resolutely reject any substitute.

TWICE ACTUAL SIZE.



This plug has hitherto been sold at 5/-

NOW 4/- NET.

LODGE BROS. & CO., Dept. E. New St., BIRMINGHAM.

ROM TYRES

(ALL-BRITISH.)

Pennard Villa,
Llanelly, S. Wales,
March 6th, 1912.

Dear Sirs,

Your Combination motor cycle tyre has rendered such excellent service that it is a great pleasure to me to testify as to its durability, especially for passenger work.

I have had three of the most expensive makes of tyres on the driving wheel of my 3½ h.p. 2-speed Humber; the average life of these has been three months (or a little less). Six months ago I resolved to try a ROM Combination—the result has been more than satisfactory—after six months' riding on bad roads and in all weathers it is practically as good as new.

It will also interest you to know I have had no sign of a puncture, and only required the use of the pump about every 3 weeks or month, just to ensure it being properly hard.

Your tyre is deserving of every praise, as I do a lot of sidecar work and use the machine every day on business.

Yours faithfully,
(Sgd).
JNO. A. WELLS.

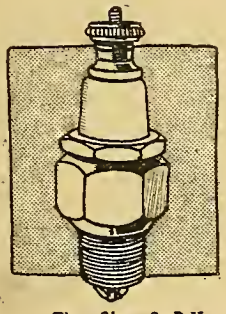
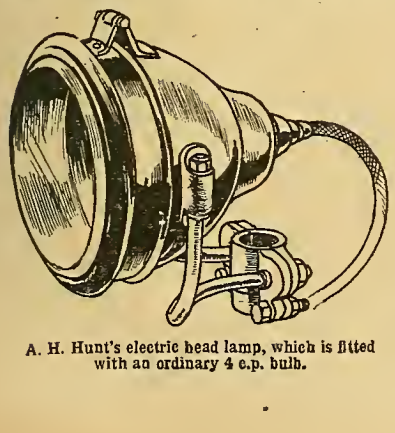
boxes made for the purpose—if there is a corner somewhere into which the case can be jammed, for these cases are an awkward shape for tight strapping, and a motor cycle has a marvellous knack of casting



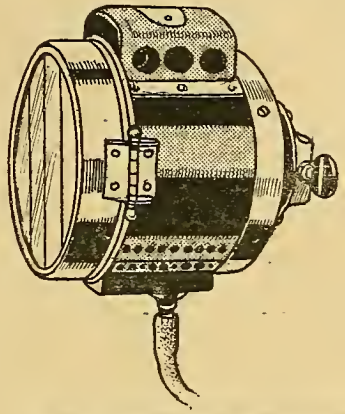
A woollen throatlet sold by Hunt's Stores.

loose any queer shaped objects strapped to its rigid portions. Personally, I reserve the left-hand pocket of my waterproof coat for the spare inner tube.



Section of Lodge patent Steatite plug.

The Oleo 2 B.M. sparking plug specially designed to withstand great heat and pressure.

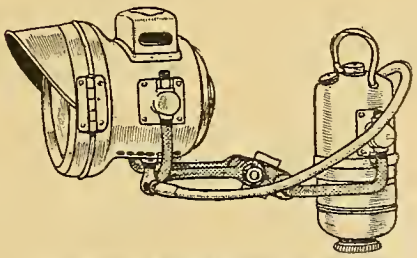


Lamps and Generators.

In the matter of lamps, I find that the extra few hundred feet of illumination procured by very costly sets make very little difference to the speed at which I travel in the dark. Perhaps I

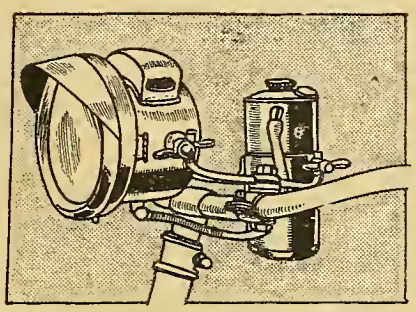
A. H. Hunt's electric head lamp, which is fitted with an ordinary 4 c.p. bulb.

lack the pluck to take full advantage of their light. At any rate, I usually employ a lamp at about a guinea (not including a generator), and find that this enables me to average legal limit on roads I know. Probably, if I had better eyesight, I should use a more expensive lamp and average 30 m.p.h. on roads I do not know, until I got lagged. I use two generators. One costs 5s. 6d., and is a somewhat shoddy affair—it is employed on all-short runs, and serves



A.B.C. separate generator lamp which has an ebony finish for all-weather use.

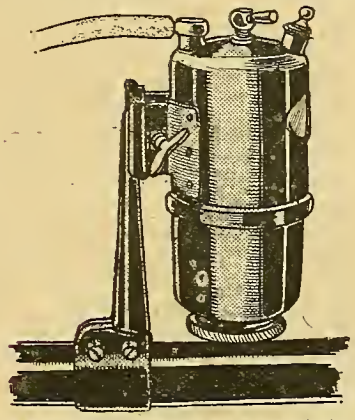
as a spare on the rare occasions when I ride all night; the other is a big riddle-grid, which is mounted behind the steering head on long night rides. If you want to be economical with your carbide, and maintain a first-rate light all night, the water valve should be under your hand all the time. I have not yet discovered an efficient automatic generator, either for car or cycle, and I must say I should like to try the Yankee plan, and use a dissolved acetylene cylinder.



Detachability of Lamps and Generators.

My chief point about a lamp is that it must be instantly detachable. I

The Miller Mangin lens lamp and generator set. The special combined bracket attached to the steering head is a great convenience, as we have proved from practical experience.



loathe carting round a heavy and costly and bulbous-looking lamp when I only intend to ride ten miles at midday; and some of the modern lamps resemble a Chinese puzzle, and call for three special spanners if they are to be rapidly and accurately attached with their formidable brackets. Nor do I like riding with their huge forked brackets empty; if some *contretemps* sent one sailing over the handle-bar, these forks are guaranteed to arrest one painfully *en route*.

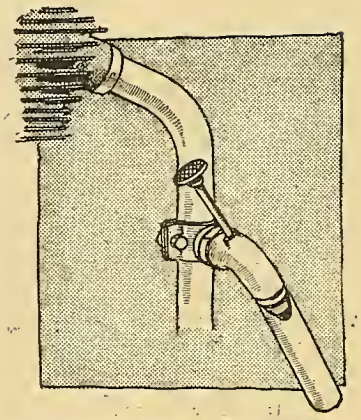
The Lucas lamp and generator set attached by a special bracket to the handle-bar.

Horns and Hooters.

The hooter is a detail on which good men and true have spent as much as £5 between May and September. There is the horn which sheds its twisted mouth and barks grumpily out of an abbreviated socket; there is the horn which slides down the bar and jingles merrily against the A.C.U. badge; there is the horn which suffers from what doctors call aphasia. The main point

A.B.C. generator attached to the top tube by a special bracket. This also has a black finish.

about the horn is its clip. Eschew the cheap horn with soft brass screws—their cheese-heads fall off when you try to tighten them, and leer drunkenly up at you out of the mire. Eschew the large horn—it looks like Johnny Trundley on a Motosacoche. Get a good small horn, with a first-rate clip, and when it loses its voice, just stroke the inside of the

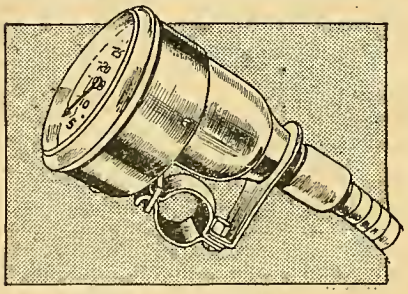


A three-coil horn sold by Brown Bros., Ltd.

reed-tongue with a slip of tissue paper, and all will be well. Exhaust whistles are all right, if considerately used, but there are times and places where it is bad manners to use them; they should therefore be made use of only when necessity requires the removal of a deaf or obdurate carter who is blocking up one's passage in a narrow lane.

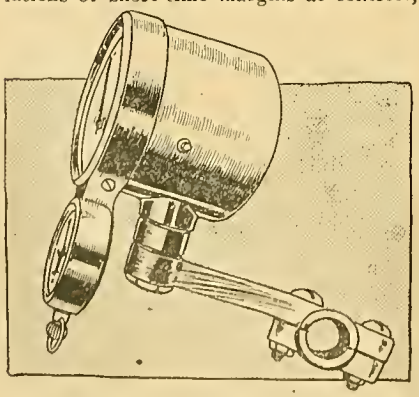
One of my first resolutions is to scrap the tyre pump presented with the

Touring Equipment.—



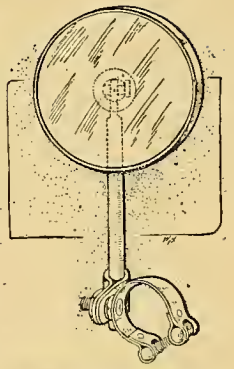
The Garner brass exhaust whistle, showing the convenient position it occupies near the footrest.

machine; in some cases this pump will prove to be of peculiar dimensions. I believe some pumps are made for this purpose exclusively, for nobody outside Bedlam would ever buy them for any more strenuous purpose than inflating a child's toy balloon; but I am pleased to see several makers now give really sound articles. As a man whose tyres are usually on the burst, I always carry a five-shilling pump.



Advantages of Speedometers.

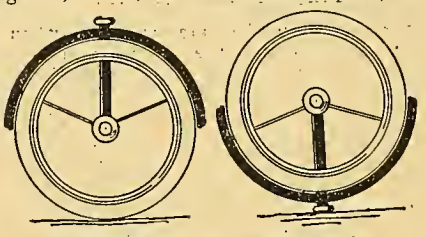
The one luxury I allow myself is a speedometer, which is really almost a



Smith and Son's speedometer and mileage recorder.

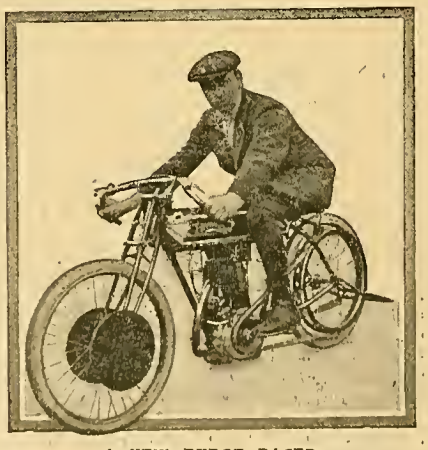
necessity. When the road is dull, it provides entertainment; when milestones are missing, it provides information; in reliability trials, it is absolutely indispensable under the horrid modern regulations of short-time margins at controls,

A new Jones combined speedometer and watch, a useful addition to Messrs. Markt and Co.'s range of accessories.



secret or published; but most of all is it invaluable in tuning up. Some riders tell me their trouble is to find a piece of road on which they can test their tunings, for the machine does sixty if they adjust the carburetter. When I am tuning up, I screw the adjustable pulley down to its very smallest diameter, so that the machine cannot possibly exceed perhaps 40 m.p.h.; then any ordinary road provides a good testing ground in the early morning, and at these speeds the machine is easy to hold, and the speedometer readings are exact and legible.

Kerry handle-bar mirror.



A SIDECAR NOVELTY.

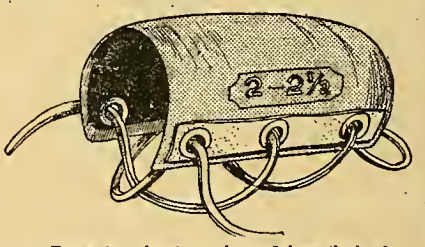
The sketches herewith illustrate a novelty placed on the market by Norman, Ray, East and Co., 36 Woodlands Road, Ilford, E. It is termed the "Stanguard," and, as the name implies, it

The "Stanguard," a name adopted for a combined sidecar stand and mudguard.

forms a combined stand and mudguard (for a sidecar). When in use the guard swings round the wheel and leaves the tyre exposed for repair purposes, and automatically refixes itself when brought to the "running" position. The device is neat, and should have a future for sidecarists.

A NEW RUDGE RACER.

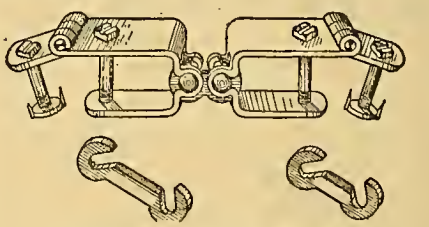
W. F. Guiver, a member of the Brooklands and British Motor Cycle Racing Clubs, and his new Rudge racer built solely for competition work at Brooklands. He will compete at the opening meeting of the B.M.C.R.C. on the 23rd inst.



HANDY NIGHT LIGHT.

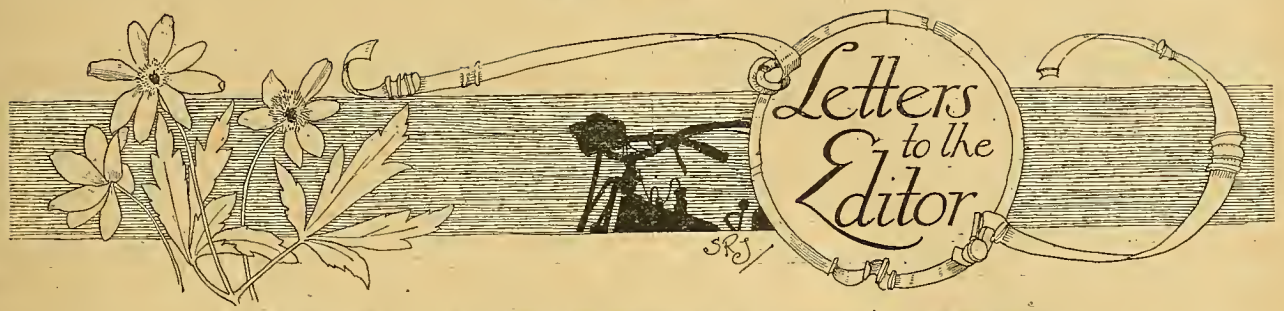
A neat article is the Sphinx flex jet, which enables repairs to be effected with a great deal of comfort at night, and without removing the gas generator from its bracket. The flexible metallic tubing carries an internal wire which allows it to stand out rigidly and support itself at any angle, and the cap at the generator

A handy portable jet enabling difficult repairs or adjustments to be undertaken at night.



end fits any standard nipple. This naked light permits trivial adjustments to be made without disturbing the lamp. It is advisable to add the caution that the naked light must be kept away from the petrol tank orifices and the carburetter. The flex jet should not be carried loosely in the tool-bag, as, with a small piece of additional rubber tubing pushed on over the burner, it forms a normal connection between the generator and the head lamp, and is thus always ready for use.

Turco tyre hand. A useful method of temporary repair for bad cuts or gashes in covers. It is laced around the rim.



A FLEXIBLE BELT FASTENER.

The detachable and adjustable belt fastener which we illustrate is manufactured by Messrs. Packer and Prentis, Roden Street, Ilford, E. Its chief feature, apart from its detachability and adjust-

The C.Q.R. adjustable belt fastener, with hinged extensions.

ability by means of hooks of different length, is the extra bolt and hinged top plate, which have been introduced to prevent the bolts pulling through. If the plate were merely extended to take an extra bolt without being hinged, it would, of course, destroy the flexibility of the fastener, but, by hinging it and making use of spiked nuts, as illustrated, the flexibility of the fastener is retained. It is sold under the name of the C.Q.R. adjustable belt fastener.

Improvised Variable Pulley Gear.

Sir,—We notice in your correspondence columns on page 246 of March 7th, a letter from one who signs himself "Zedel," suggesting a method of treatment for our pulleys, which we strongly advise your readers not to adopt. We sell this product as a belt pulley, adjustable by hand; and not as a variable gear, to be operated by a kick from the foot, and we should decline to accept responsibility for the failure of any pulley subjected to such abuse.

BLUMFIELD, LIMITED.

Pillion Seats.

Sir,—I should be very glad if Mr. Chas. O. Cox, whose letter was published on March 7th (page 247), would inform us how he and his wife start off, seeing that his machine is fitted with a fixed gear. H. PRITCHARD.

Sir,—Now that the riding season has begun, I have noticed several instances of motor cyclists taking a passenger behind them on the luggage carrier, and it is high time that attention was called to this dangerous practice.

In the first place, luggage carriers are not usually designed to carry the weight of an adult, and in the second place, the back tyres of motor cycles are not strong enough for the purpose.

The number of serious and fatal accidents which occurred last year ought to make riders think twice before carrying a passenger on behind them.

When one thinks of the rider's feelings when the back tyre has burst, with the driving wheel wobbling about, together with his passenger holding on to try and maintain a balance, it is quite easy to see how difficult it is to steer.

G. H. WAIT, M.I.A.E.

Correct Position of Number Plates.

Sir,—At the beginning of the year there was much written in *The Motor Cycle* regarding clean counties, and Cambridge was quoted as being clean. It may be clean as regards traps, but I should like to make it known, through the medium of your valuable paper, how I have recently been treated in the Cambridge Borough Police Court.

Recently, as I was competing in a speed trial organised by the C.U.M.C.C., I stripped my machine and tied my back number plate to my back, the front plate being on the front forks. The police summoned me, and I appeared before the Mayor and one other magistrate, and was fined 10s. with 7s. costs for the purely technical offence of having my number plate on my back. The magistrates, however, were not content with thus heavily mulcting me, but caused my licence, previously clean, to be endorsed with the following words, which I consider do not state my "offence" truly, but exaggerate it grossly: Date of conviction, March 12th, 1912; offence, driving motor cycle without mark; sentence, fined 10s. and costs 7s. G. F. RANDALL.

[We do not think our correspondent can reasonably complain of the treatment meted out to him. The Act says the registration number plate must be attached to the machine front and rear in a vertical position. If he fasten it to his body it can seldom be in a vertical position, and, therefore, not always easily distinguishable. As the licence had to be endorsed, it would have been better to refer to the offence as a contravention of the L.G.B. Order.—ED.]

Hydrogen Peroxide in Acetylene Generators.

Sir,—I notice in *The Motor Cycle* of March 7th, in reply to Mr. A. Renfred Myhill, an article on the above subject. The author would seem to be unacquainted with the elements of chemistry. Three observations I might make. First, is not the oxidisation of hydrogen sulphide to sulphuric acid a questionable matter? Second, how can free sulphuric acid exist in the presence of lime? Chemical action would take place between the acid and lime, and the metal could not be corroded. Third, has not the author altogether forgotten the catalytic effect of the peroxide? KENNETH C. ORR.

Sir,—In view of the articles and letters which have appeared in *The Motor Cycle* for several weeks past, respecting the use of hydrogen peroxide for increasing the luminosity of the acetylene light, it may interest your readers to know that we, some time ago, applied for letters patent, covering the use of sodium perborate for this same purpose. Several of your correspondents have pointed out certain drawbacks attending the use of hydrogen peroxide for the purpose above mentioned. In the first place much has been said as to the instability of hydrogen peroxide, and in this connection we would like to say that hydrogen peroxide is not nearly so unstable a body as appears to be generally believed—at any rate, if the hydrogen peroxide has been properly made. At the same time it cannot be claimed that it can be kept for an indefinite period under all conditions without undergoing some loss of strength, and, of course, the fact of its being a liquid is a disadvantage. Commercial hydrogen peroxide is invariably acid, and, doubtless, as some of your correspondents have pointed out, this is objectionable. Sodium perborate, on the other hand, is quite free from acid, and is perfectly stable, and, being in the form of a dry powder, it is much more convenient to handle and to store than is hydrogen peroxide. Sodium

The Motor Cycle finds its way to all corners of the earth. The snapshot was taken in the far away huts in Northern Nigeria, W. Africa.

perborate contains over ten per cent. of active oxygen, and it is, therefore, about three times the strength of twenty volume hydrogen peroxide. It may, indeed, be regarded as concentrated hydrogen peroxide in a solid form. Perborate, however, as usually met with in commerce, is not very readily soluble in water, but we have overcome this difficulty by modifying the composition of the perborate so that it will readily dissolve in the water which is added to the acetylene generator. Should you, or any of your readers, be desirous of obtaining any further information in regard to this special perborate, we should be pleased to furnish the desired particulars.

B. LAPORTE, LTD.

Military Motor Cyclists.

Sir,—I read the contributions to your valuable paper by "Celeriter" on the subject of the N.A.C.D. with rather mixed feelings. It is only natural that I should do so, as only a year or two back I advocated a formation of motor cyclists under exactly the same conditions, but at that time I was soundly rated and taken to task for my presumption, presumably for thinking of an original and commonsense plan of home defence before our tape-bound officials.

I lay no special claims to occultism, but I could plainly see that the time would come—as it is coming now—when our Government would be glad of men under nearly any conditions.

SCOTT.

M.C.P.A. and Trade-assisted Riders.

Sir,—I have read with interest in *The Motor Cycle* about the formation of the "Motor Cyclists' Progressive Association," and consider that there is plenty of work for it in various directions.

For instance, the association might devote its attention to the trade-assisted amateur. That such a person exists cannot be doubted by anybody who reads the reports of the various competitions and trials this year, one "amateur" having ridden no less than four machines since Christmas in the five following events: London-Exeter, London-Gloucester, Sutton Coldfield, Montanglaust hill climb, and A.C.U. one day trial.

In view of the decision of the Manufacturers' Union not to support the T.T. this year, I hope that the A.C.U. will adopt drastic measures to prevent this unsportsmanlike practice.

J. A. ROCKE.

Licences in Clean Counties.

Sir,—Please insert the enclosed copy of letter in your correspondence columns as a reminder to your readers.

[COPY.] S.V.135.

"To the County Accountant, Bedford.

"Dear Sir,—Enclosed you will find three declaration forms duly filled in, together with a money order to the value of £3. Please issue to each of the persons named therein a motor cycle licence for the year 1912, and forward all three in the enclosed stamped addressed envelope bearing my name.

"In view of the fact that unnecessary police interference and unsportsmanlike traps are both on the increase in London and Surrey, it behoves all motorists residing in these black parts to show their appreciation of the "clean" counties—of which Bedfordshire is one—by forwarding their motor and establishment licences to those who do not use their roads as a means of filling their coffers from the pockets of motorists."

Single-cylinder Class Limits.

Sir,—I note that the Bristol Motor Cycle Club are advertising an open climb for Saturday, April 20th, and their single cylinder touring class is limited to 500 c.c., which excludes several well-known machines.

I should like to point out that during last year many of the best known clubs extended the limit of cubical capacity in their single cylinder touring class to include the machines of several well-known manufacturers who make a single cylinder engine exceeding 500 c.c. The "James" 3½ h.p. engine, 86 × 96 mm., has a cubical capacity of 557 c.c.

It seems only reasonable that clubs, as amateur organisations, should draft their regulations in such a way that owners of any make of machine may compete, and I hope it is only necessary to call attention to this matter for it to be remedied.

Correspondence in the motor cycle press has proved that there are many experienced cyclists who find that the 500 c.c. engine has not a sufficient reserve of power for touring and occasional sidecar work, and in fairness to those manufacturers who are striving to develop the most satisfactory engine for all-round work, such engines should not be barred from competitions.

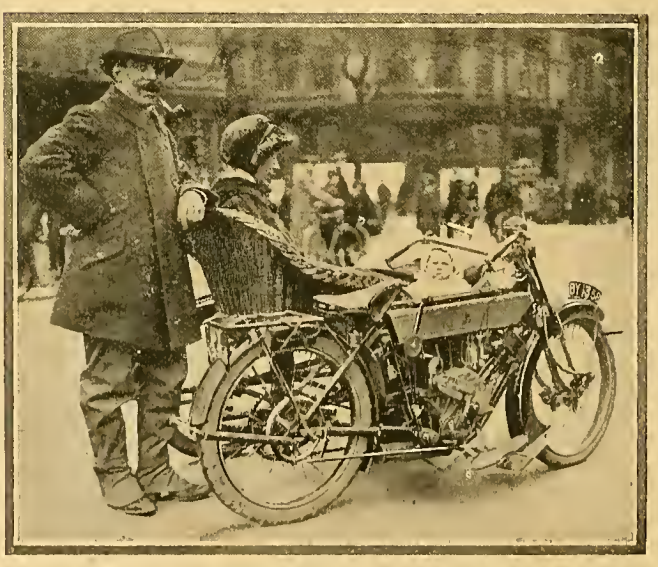
JAMES CYCLE CO., LTD.,
A. DOUGLAS ARTER, Secretary.

A French View of the Motor Cycle.

Sir,—I read in the number of March 7th an article entitled "A French View of the Motor Cycle"—a reproduction of the naive ideas appearing in an article in the last issue of the T.C.F. journal. Allow me, in the name of the majority of French motor cyclists to protest against this article. Firstly, the author forgets that change-speed gears and variable pulleys first saw the light in England (Gradua, Midget-Bicar, and Rudge). Secondly, that the light motor bicycle as made in France generally has automatic valves, is difficult to start, has pedal bicycle accessories, and is calculated to deter all those who are inclined to try the pastime. On the contrary, all really serious motor cyclists are in favour of greater horse power and reasonable weight—at least 154 lbs. with change-speed gear, etc. The success of the Triumph and New Hudson machines, which are beginning to be seen in Paris, has resulted in no one who has seen one of these English motor bicycles wanting a French one. As to the French voiturettes, not one of them is worth a good sidecar, and, in the opinion of one of the members of the firm X——, are instruments suitable only for lunatics. Would you be good enough to translate this protest and let it appear in your publication, for which I shall be much obliged.

O. DE CARFORT.

Paris.



Three and Four Wheeled Cyclecars.

Sir,—Mr. G. J. Allday's contribution to this subject is valuable and of special interest to those of us who have sought a practical solution to the problem of the cyclecar.

As makers of the motor tricycle with two rear wheels, we heartily agree with his conclusions, for his arguments in favour of the four-wheeler may equally be applied to our type of machine, viz.:

(1) Accessibility and interchangeability of tyres.
(2) Rear wheels sharing the weight and driving strain, with consequent prolongation of life to tyres.
(3) Proper road adhesion (with abnormal weight removed from single driving wheel).
(4) Stability.

These advantages are conspicuous in the machine, of which you published an illustration, on March 7th, and which,

THE SIDECAR AS A FAMILY MOTOR.
An owner of a P. and M. sidecar outfit snapped at Tunbridge Wells. It is amusing to observe the tranquil expression of the child in the front of the sidecar.

Harold Townend & Co.,

POLICIES POLICIES

13 & 14, Abchurch Lane, King William St., London, E.C.

Some of the leading Insurance Companies of Great Britain have arranged exclusively for Harold Townend & Co., the following

Comprehensive Motor Cycle Policies.

	INDEMNITIES.
(1) THIRD PARTY RISKS—A complete indemnity against all claims made for personal injuries or damage to property caused by motor cycle, including all Law Costs incurred by or with consent of Insurance Company.	UNLIMITED IN YEAR Up to £250 per accident.
(2) ACCIDENTAL DAMAGE to Motor Cycle and Sidecar, including lamps and rubber tyres when the Motor Cycle is also damaged, but excluding mechanical breakdowns.	Up to value insured.
(3) FIRE, explosion, self-ignition, lighting or acetylene gas, including also accessories and sidecar.	Up to value insured.
(4) BURGLARY, housebreaking, larceny or theft, including also accessories and sidecar if motor cycle also stolen.	Up to value insured.
(5) TRANSIT by road, rail, or inland waterway within Great Britain and Ireland, Channel Islands and Isle of Man.	Up to value insured.
(6) BONUS—If no claim is made 10% is allowed off renewal premium.	

ANNUAL PREMIUMS.

Value of Motor Cycle (including accessories and sidecar if one used.)

Not exceeding		£30	£50	£75
A	Under 3½ h.p.	£2 0 0	£2 2 6	£2 5 0
B	3½ h.p.	2 2 6	2 7 6	2 12 6
C	5 h.p.	2 7 6	2 10 0	2 15 0

Special Notice.—THE ABOVE PREMIUMS INCLUDE USE OF SIDECAR, and are applicable to Motor Cycles used for pleasure purposes, ridden solely by registered owner.

Please Note.—If owner bears first £2 10 0 of each claim the above premiums are reduced by 20 per cent.

FULL LIST ON APPLICATION.

THE HANOVER RUBBER COMPANY,

17, Goswell Road, Aldersgate, London, E.C.

ESTABLISHED 50 YEARS.

fitted with a two-seater body, forms a convenient and comfortable runabout. On the other hand, we do not quite agree with Mr. Allday as to a fourth wheel being indispensable, as a three-wheeler of the type above referred to has the following further points in its favour :

(a). Absence of side slip.

(b) Capacity of machine to turn in its own space.

(c) Cheapness and simplicity of working parts (no reverse nor complicated steering gear needed).

(d) Economy of upkeep (not exceeding that of the side-car combination).

(e) Taxed as a motor cycle. A. W. WALL, LTD.

Sir,—In your correspondence columns from time to time appear letters on runabout design, in the majority of cases setting forth the supposed advantages of the four-wheeled design over that of the three-wheeler; these critiques are based on supposed technical reasons, or on experience with the old type of tricar; the writers usually aver they are unbiassed; possibly I am biassed as the result of my experience with the modern three-wheeler. I will give a few practical reasons, not theoretical ones.

I own a three-wheeler with side-by-side seating. There is, contrary to the view expressed generally, plenty of seating room for motoring, but certainly not sufficient for use as a caravan. I don't wish to ape the big car; the petrol consumption is 55 m.p.g.; I can do 55 m.p.h. with two up, climb anything; it has conquered 1 in 3½, is perfectly steady in grease, and, most wonderful of all, will not overturn with one or two up as your correspondents seem to imagine.

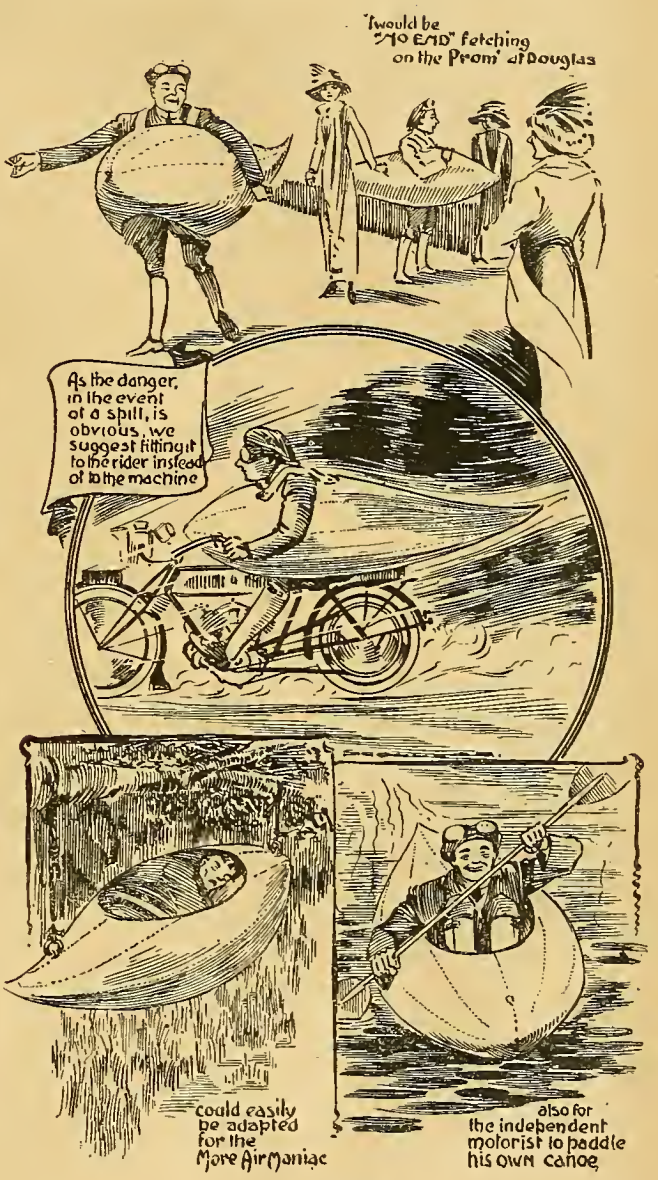
Mr. Gilbert J. Allday, in a letter published March 7th, lays down the dictum "that we still have conditions which determine the life of the rear tyre as being, at the best, but a short one"; this is a sweeping statement. I don't know if he has any practical experience of this type. He may be interested to hear that the rear tyre on my runabout, after roughly 1,000 miles running over some of the roughest and hardest roads of the country, combined with hard driving, is hardly in the decrepit condition that he imagines; it is, in fact, hardly marked, the rubbing on the tread has not worn half down at its worst part.

Mr. Allday claims 100 per cent. additional life for the rear tyres of the four-wheeler; that, certainly, is no advantage, as the four-wheeler has 100 per cent. more rear tyres. It has been my unfortunate experience on several occasions to have comparatively new tyres ruined by cuts or bursts; surely there is but half the risk again with half the number of rear tyres.

Mr. Allday certainly much overdraws the squatting in the mud for puncture repairing; would he suggest repairing the punctures on a four-wheeler while sitting in it? Anything that applies to the three-wheeler applies equally to one with four; there are such things as butted tubes.

In conclusion, may I point out that it was a three-wheeler, the A.C., that suggested the idea of the modern runabout; also, notwithstanding the vaunted superiority of the four-wheeler, it has never appeared successfully in any competition promoted for it in this country. The A.C.'s and Morgans have, I think, appeared in every big competition for some time with remarkably successful results.

The reduced weight of the three-wheeler is notorious; its stability is perfect, much more so than the tandem seaters I have tried. My runabout is a Morgan; I have, unfortunately, no interest in it. R.T.A.



Consumption Comparisons.

Sir,—You certainly raise a subject of great interest in your article on consumption comparisons in your last issue.

The chief reason for the comparatively high petrol consumption of the 3½ h.p. 500 c.c. single-cylinder motor cycle as against the four-cylinder 15 h.p. car is as follows :

The cycle has an engine which, roughly speaking, develops 1 b.h.p. per 100 lbs. weight and the car 1 b.h.p. per 200 lbs., the cycle having just twice the power of the car weight for weight. The cycle is so geared that unless it is climbing a steep hill it is only necessary partly to open the throttle to run at 20 to 30 m.p.h., and the engine is working for the majority of the time under uneconomical conditions. The car engine, on the contrary, would be running on nearly full gas at consequently maximum efficiency.

MORE STREAMLINE NOTIONS.

There is also another advantage for the car. With its four-cylinder engine and even torque a form of transmission can be used which has high efficiency and no slip. The best single-cylinder motor cycle engine has an uneven torque, and consequently a so-called flexible transmission becomes a necessity, this usually taking the form of a V belt which is inefficient, particularly when passed over a small engine pulley.

In my opinion the 500 c.c. engine is too large, and as a standard for solo work, an engine of 350 to 400 c.c. capacity designed to give a steady torque and fitted with an enclosed positive transmission, will in the future, do all that the present 500 c.c. belt-driven machine is capable of under road conditions.

As examples I quote the 2¼ h.p. shaft-driven F.N., which, I believe, can easily average 25 m.p.h. and has a petrol consumption of about 150 m.p.g. and the Douglas which has just achieved such a wonderful result at Montanglaust. The former machine has a shaft-drive and the latter an intermediate positive gear allowing a large pulley to be used for the belt. Both these machines, like the car, have outside flywheels. A.M.I.C.E., A.M.I.E.E.

Sir,—Whilst agreeing that the subject is abstruse, I think that it is not really so mysterious as at first sight may appear.

For instance, a lightweight of, say, 2¾ h.p. that would do 150 miles to the gallon, would be taken as an average. Now compare my average mileage on my 6 h.p. Zenith during 1911—110 miles to the gallon! This is absolute fact. This machine is more than twice the power of the lightweight, and yet it would go about three-quarters the distance that the lightweight would go on the same amount of spirit.

Take the weight of the lightweight as 140 lbs. and the 6 h.p. at 240 lbs., and it will easily be seen that the ton mileage is much greater in the case of the heavyweight.

Then take the case of motor cars, although I fear I may be treading on unfamiliar ground.

I believe that a car of about 10 or 12 h.p. would be doing well if it did thirty miles to the gallon, and yet I have read and heard of cases of 30 and 45 h.p. cars doing over twenty miles to the gallon. All this points to the fact that to gain a certain amount of extra power does not necessitate a corresponding amount of fuel.

It seems to suggest to me that a certain amount of power is lost, and only over a certain point do we get full power from the fuel supplied. Take, for instance, the case of my 6 h.p. Zenith. On one gallon of petrol it was possible for me to go 110 miles; now, if I were able in some way to transform it into a 2¾ lightweight, I could only go a matter of another 40 miles or so, and on this reasoning reduce it still further to, say, 1 h.p., and you may expect to go 200 miles to the gallon.

What I am driving at is that it takes a much greater amount of fuel to develop the initial power; after a certain amount of power is developed, then power is cheaply developed.

As a simile. A waggon standing stationary in the road requires quite an effort to start, and yet when it is moving it requires a comparatively small amount of power to keep it going—even a railway carriage can be kept moving by one or two men, but it would puzzle them to start it.

On the foregoing reasoning it will be gathered that my idea of the whole thing is that the greater the power the less it costs, whether it be motor cycle or motor car.

If you installed an electric plant for driving ten tramcars, and then required to drive 500 cars, you would not have to build a plant fifty times the size.

SYDNEY R. AXFORD.

R.A.C. Warning Signs.

Sir,—I notice from your last issue that the R.A.C. has found it necessary to erect a special sign post at the Midland Railway Company's level crossing on Watling Street.

There is also a very dangerous Midland Railway crossing, although not a level one, on the Bramhall Lane, between Stockport and Bramhall. The condition of this road, for about 100 yards, is such that, if a car goes over it at more than ten miles an hour, it invariably breaks something. I have seen a car lose its silencer going over this small stretch, and many have gone home with broken springs. I often go five miles round to avoid this piece, as it is not even fit to push a good machine over the footway.

There will come a day very shortly when someone will break his front axle and run into the wall. After his death, and the resultant claim for damages, perhaps the road will be repaired.

Look at this road, and you will agree with

CYRIL M. DAVIES.

Necessity is the Mother of Invention.

Sir,—In reply to Mr. J. B. Dall's letter in the last issue of *The Motor Cycle*, I still hold that it is impossible to thaw a generator by holding it close to the silencer when the machine is running on the stand. My experience only dates back for the last nine years, and consists of a 1½ h.p. flat belt F.N., a 2 h.p. chain Humber, a 2¾ h.p. Chater-F.N., a 5½ h.p. Rexette tricar, a 5 h.p. twin Chater Sarolea, a 5 h.p. Bat, and now I use a 1909½ standard Triumph and a 10-12 h.p. Humber car.

With the exception of the 1½ h.p. F.N. and the 2 h.p. Humber, both of which I almost forget by now, any of the above named machines would not emit the exhaust sufficiently warm to thaw the generator, except perhaps after a long run on a sweltering hot day in a summer like we had last year, and then we do not get frost in sufficient amount to freeze our generators.

I have this moment come in from a ten-mile ride on the Triumph, and when I stopped at my house, I verified my statement (that the exhaust when it leaves the silencer was practically cold) by holding my hand close to the exhaust box when the machine was running on the stand, and on another occasion I also verified it with the car.

Perhaps, Mr. Editor, Mr. Dall's machine wants a little doctoring, as its temperature seems up. May I ask how is its pulse? No doubt an aperient mixture to clear out the carbon and soot from the cylinder and silencer would bring its temperature to what I find is normal with my machines.

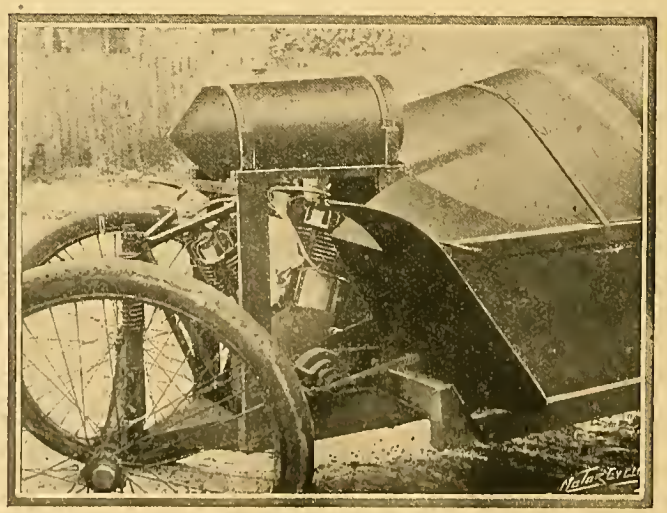
Thanking you, sir, for the space you have allowed for my letters in my best weekly paper,

(Dr.) SELBY CLARE.

Two-stroke Engines and the A.C.U.

Sir,—In your last issue, I notice that "Fair Play" has opened up a subject of great interest to all riders of two-stroke machines. As he points out not one hill-climb was won by a Scott rider in 1911, I think this will be sufficient proof to the A.C.U. that the special handicap on the Scott is unfair and does not give the rider a chance. All we want is a sporting chance, and when we get that I am sure that the Scott riders will be there. Surely the A.C.U. cannot expect a 3½ h.p. Scott to travel up an incline at a speed about equal to a 5 h.p. Indian; when the average length of a hill is only half a mile the water-cooled machine has not time to show its advantage over an air-cooled engine.

SIR WALTER.



Lancashire Clubs and Competitions.

Sir,—Would it not (considering the number of clubs in this county) be a feasible idea to include one or two open classes in the various club events? In my opinion it would create a good feeling among the clubs, and, being so near together, plenty of assistance would be forthcoming; also the holding of such events would be a good opportunity for getting riders together. A number of inter-club events would probably be held greatly to the enjoyment of members. If two delegates from each club would arrange to meet, I feel sure it would eventually lead to something. If club secretaries would write me (c/o the editor) their views on the matter a meeting could probably be arranged.

R. H. WINTERBOTTOM, trials sec. Burnley A.C.

SUMMARY OF CORRESPONDENCE.

Mr. G. B. Barham, A.M.I.E.E., wishes to thank the driver of the car and the cyclist who so kindly assisted him on the 10th inst.

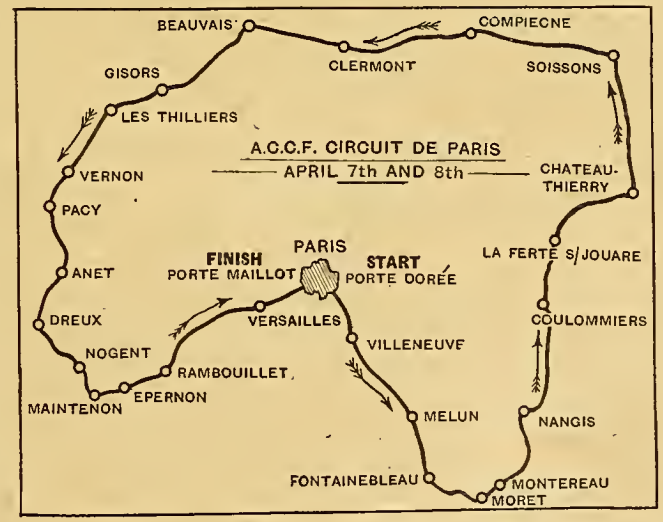
The Low engine. A feature of this engine is that its remarkable power enables itto give a high road speed for a moderate number of engine revolutions. See page 298.)

THE CIRCUIT DE PARIS.

BY THE A.C.U. DELEGATE.

MY arrival at the Gare du Nord was welcomed with true Gallic hospitality by M. M. Eugène Debailly (President), M. Gaston Buissard (Vice-president of the Auto Cycle Club of France), and M. R. Lecomte (a member of the committee).

The Regulations.



The regulations for the event, which takes place on April 7th and 8th, were discussed at length the same evening at the Café Madrid by Messrs. Debailly, Buissard, Lecomte, Cheilus, Daiur, Compain, C. Plasolles (secretary), and myself. The trial is for motor cycles divided into five classes, arranged according to cylinder capacity, while there is a minimum weight limit, which does not concern English riders, as their machines easily exceed it. Class I., up to 225 c.c.; Class II., single cylinders up to 350 c.c.; Class III., multi-cylinders up to 350 c.c.; Class IV., single cylinders up to 500 c.c.; Class V., multi-cylinders up to 650 c.c.; Class VI., any size engine. Passenger machines: Class I., single cylinders up to 750 c.c. and multi-cylinders up to 1,000 c.c.; Class II., any size engine. Voiturettes: Class I., the same cylinder limits as the above; Class II., for machines with belt transmission and same cylinder limits as above. The weight of passenger and driver must not be less than 150 kgs. (330 lbs.) Any deficiency must be made up by weights.

Cylinders, forks, and frames must be sealed; hubs and crank cases must be stamped. The stamping is microscopic, and does not deface the machine in any way. Tyres must be of standard size. Those fitted to ordinary standard English machines will suffice. Regulation brakes and efficient mudguards must be fitted, and pedals or some description of mechanical starting device. Exhaust pipes and silencers must be fitted so as not to raise dust. Cylinders may not be drilled so as to allow a free exit for the exhaust gases. It will be seen that these rules are not severe, and consequently any standard touring British motor cycle or sidecar combination is eligible.

Now as to the running rules. These are equally easy. The machines are stored in enclosures in charge of an official. Once inside these enclosures nothing of any kind whatsoever may be done to the machine. All replenishments, repairs, or adjustments must be made outside the enclosure during running time. The set speed is nineteen miles an hour, but the going is absolutely free and easy. All that one may *not* do is to leave the route or arrive too early or too late at the controls. If a rider is too early he must wait till his time is up before signing the checking sheet. If he is too late, he loses one mark for each minute behind time. The English rider, therefore, need not be afraid of being bound down by vexatious rules.

The Hill-climb.

There will be a hill-climb at Montanglaust on the old road leading out of Coulommiers. It will, in fact, be a speed trial three kms. in length, of which two kms. are uphill. Performances in this test will not count in the general classification, but will serve to separate competitors in case of a dead heat. Only the difference in time between the first and second men will be published. Entry fees are—non-members 60 francs, amateur members free, trade members 50 francs. Cost of membership to the A.C.C.F.—35, Rue Crussol, Paris—is 20 francs. There will also be an amateur class, cost of entry 10 francs. Amateur entrants will not have the names of their machines published in the official results. Entries close March 31st. Competitors who have lost no marks will be classified according to the results of the Montanglaust speed trial on the formula $\frac{PV + V^3}{C}$. P = weight in kgs. of machine and rider, V = speed in metres per sec., C = cylinder capacity.

The route shown on the accompanying map is a charming one, not too severe, nor too long, but of sufficient difficulty and duration to make it both sporting and interesting.

It has been suggested that competitors should go the whole way by road, and I earnestly hope that the A.C.U. will adopt this suggestion, and send an official to organise the whole trip who could act as interpreter and guide the party as far as the outskirts of Paris. If this idea be adopted, I should suggest that the crossing be made on Good Friday from Newhaven to Dieppe, which entails the shortest road journey, that a stop for the night be made at Gournay-en-Bray or some such convenient place, and an early start be made the next morning for Pontoise, where the officials of the A.C.C.F. would take the English team by the best road to the Porte Maillot, where the sealing of the machines takes place. Thereafter the A.C.C.F. would be our pilots, and conduct us to the Porte Dorée, whence the start is made at 7 a.m. the next day.

The A.C.C.F. will offer a gold medal for the best team performance, one English and the other French, thereby encouraging friendly rivalry between the two countries. Intending entrants should communicate immediately with the secretary of the A.C.U., 89, Pall Mall, S.W.

CURRENT CHAT

TIME TO LIGHT LAMPS.

Mar. 21st	... ...	7.12 p.m.
,, 23rd	... ...	7.15 ,,
,, 25th	... ...	7.19 ,,
,, 27th	... ...	7.22 ,,

Still Climbing!

The next hill-climbing feat by Frank Smith and his Clyno will be an attempt on Tontop, a difficult ascent with eight acute bends ten miles west of Kendal.

Oxford University M.C.C. Hill-climb.

The officials ask us to state that in the all comers' class at the Horsepath hill-climb, Mr. C. P. Symonds (Triumph), though seventh on time, secured second on formula with the figure of merit of 380.

Magnetos.

A number of letters have reached us from readers who have had their 1912 model machines delivered to them with last year's design Bosch magnetos. The explanation is that the new type waterproof magneto was not to be ready for delivery to manufacturers in large quantities until the spring.

M.C.C. Inter-team Competition.

The committee of the Motor Cycling Club have commissioned Mr. F. J. Jenkins, 35, Loveday Road, Ealing, W., to take charge of the inter-team competition for *The Motor Cycle* Challenge Cup. The date of this event is June 15th, and honorary secretaries of motor cycle clubs will shortly receive particulars of the contest and an entry form; in the meantime they would do well to bring the question of competing before their respective committees.

The Circuit de Paris. Latest Arrangements.

A sub-committee, consisting of Messrs. A. J. Moorhouse, W. Cooper, F. A. Hardy, Hal Hill, W. G. MacMinnies, and E. M. P. Boileau (the A.C.U. delegate), recently met and discussed the arrangements regarding the sending of a party of English riders to compete in the above event. Mr. Boileau reported the result of his visit to Paris, and laid before the committee a translation of the rules and a map of the course. It was decided that the party should leave Charing Cross, at 11 a.m. on Friday, April 5th. Those who desired to travel by road should catch the boat leaving Dover at 1 p.m. It was estimated that the cost, including travelling expenses, living expenses, and the cost of transit for the motor bicycle would be about £7 10s. for the three days. The headquarters in Paris would be, it was suggested, the Hotel St. Petersburg. The secretary of the A.C.U. is now in possession of full particulars, and those desiring to take part in this, the first international reliability trial, should send in their names, without delay, to 89, Pall Mall, S.W. It is proposed the party should return to England by the train leaving the Gare du Nord at 9.20 p.m on the Monday.

Trial in South of France.

The Marseilles Motor Club is organising a reliability trial—Marseilles to Nice and back—on Easter Sunday. Total distance, 196 kilometres. The competitors will be divided into four classes.

Class 1.—Engines under 300 c.c.
Class 2.—Under 400 c.c.
Class 3.—Under 500 c.c.
Class 4.—Over 500 c.c

The results will be based on the difference in average speed between each control and over the total distance. Two cups and numerous prizes will be awarded. The entrance fee is 15 francs. and entries should be sent to the Motor Cycle Club of Marseilles, 14, Cours Belzunce Marseilles.

SPRING NUMBER

Touring Equipment.
Testi g Brake Horse-power.
Essex M.C. Hill-climb.
Climbin r Honister Pass.
Buying Second-hand Machines.

M.C.C. Land's End and Back Run.

Competitors in the above run who have not arranged for accommodation should do so at once either at the Central or others hotels in Penzance. We understand the official quarters, the Union Hotel, have all their accommodation booked, and the town is likely to be very full at Easter.

The Motor Cycle in Ceylon.

The pastime in Ceylon is advancing by leaps and bounds, so we understand from a correspondent, who says that for hairpin and S curves the Ceylon roads would be very hard to beat. Many of the up-country roads are a succession of bends and curves every few yards. Riding under such conditions must be exciting, to say the least.

American Motor Cycles in Canada.

It is feared that the price cutting in connection with the sale of American motor cycles in Canada will have some influence on the sale of British made machines. Canada being so close to the American border, buyers are apt to be influenced by American ideas. Up to the present British-made machines have experienced a good run in Canada wherever it is possible to follow the pastime.

Australian Long Distance Record.

When the news was received last week regarding the Australian long distance road record of G. Patterson, jun., the makers of the New Hudson machine were under the impression that he used a 3½ h.p. model. A further cable has since come to hand to the effect that he was riding a 2¾ h.p. with three-speed Armstrong gear, which makes the performance more meritorious.

Motor Cycle Paced Races at Easter.

Following the paragraph in *The Motor Cycle* of February 22nd, the secretary of the S.C.C.U. Meet at Herne Hill on Good Friday was besieged with applications from riders anxious to compete in the four-cornered motor cycle paced match, the ultimate selection being as follows: C. H. Bartlett, Olympic champion; H. H. Lee, winner N.C.U. 100 and S.C.C.U. six hours; S. F. Bailey, Surrey Cup winner; and Mitchell, the holder of all motor cycle paced records from two to twenty miles.

On Easter Monday, at Canning Town, the Eastern Counties Cycling Association is including a series of motor cycle paced matches in their programme, and it is very probable that C. H. Bartlett and S. F. Bailey will ride revenge matches.

Northern League Disbanded.

Official notification has been received by the A.C.U. that the Northern League has been disbanded. It appears as if the Yorkshire clubs are now friendly towards the Union.

English-Dutch Trial.

The following entrants for the above trial have sent their entrance fees, which we have pleasure in acknowledging. Their names are: W. Cooper, G. B. McKechnie, F. C. Wasley, and H. C. Few.

Removal of Central Tramway Standards.

The West Bromwich Town Council, as a direct result of the representations of the R.I.A., has resolved to remove the existing tramway standards from the centre of the High Street, and re-erect them at the side.

Dangers of Honister.

C. R. Collier is reported to have said to his passenger that his climb of Honister was "the maddest thing I have ever attempted," that "the grade is no road," and that if many more attempts were made "there is sure to be a nasty accident."

A.A. and M.U. Scout Prevents Suicide.

An A.A. and M.U. patrol, stationed on the Warwick-Kenilworth Road, recently discovered a man lying in a state of collapse. Finding that it was apparently a case of attempted suicide by taking laudanum, the patrol obtained an emetic of salt and water, and administered it to the man, and afterwards took him to a doctor. The man was charged at the Warwick Police Court on the 7th inst. with attempted suicide, and was committed to the sessions.

R.I.A. Activities.

The Yorkshire (West Riding) Centre of the R.I.A. is devoting special attention to the Ripon and Harrogate Road. Harrogate being one of the largest touring centres in the West Riding, the road is consequently among the most important in the county. Efforts are to be concentrated to obtain an improvement in the large number of narrow bends and dangerous places that at present exist. A special inspection of the whole route was made by the Centre Committee on the 15th inst. A fully detailed scheme will now be formulated and representations made to the proper authorities upon the matter.

The T.T. Race Fund.

It has again been decided to start the Tourist Trophy Race Fund. All motor cyclists are cordially invited to subscribe towards this fund, which already amounts to about £18 17s. 6d. Below is a list of donations to the fund, and other amounts will be acknowledged in these columns as they are received:

	£	s.	d.
H. P. E. Harding	7	0	0
C. H. Hitchen	5	0	0
J. W. F. Tranmer	1	0	0
W. W. Hall		2	6
L. Newton Vigard		5	0
Hugh Gibson		5	0
The Motor Cycle	5	5	0

Further donations should be sent to the secretary of the A.C.U., 89, Pall Mall, S.W.

FUTURE EVENTS

Mar. 23.—B.M.C.R.C. Race Meeting.
„ 23.—Herts. County A.C. Open Quarterly Trial.
„ 30.—Derby and District M.C.C Open Hill-climb.
April 5-8.—N.W. London M.C.C. & Herts. County A.C. Joint Trial and Open Hill-climb (Yorks.) and Ladies' Competition.
„ 8.—Westmorland M.C.C. Open Hill-climb at Brigsteer Brow.
„ 13.—Oxford M.C.C. Hill-climb.
„ 13.—Liverpool A.C.C. Open Reliability Trial.
„ 20.—B.M.C.R.C. Race Meeting.

Bristol Open Hill-climb.

The Bristol B. and M.C. will hold its second annual open hill-climb on April 27th. There are nine events arranged, and a class is specially set apart for amateurs.

B.M.C.R.C. Race Meetings.

Twenty-nine new members were elected at the last committee meeting of the above body. Particulars and entries for the race meeting on Saturday next are given on page 319. The next meeting after this will be on April 20th. The races on this occasion will be a three-lap race for machines up to 500 c.c., a five-lap cyclecar handicap, and a one hour race for all comers, restricted to solo machines.

Next Saturday's Races at Brooklands.

We hear that one or two new engines of great power and embodying novel ideas will probably make their initial bow at Brooklands next Saturday. The cyclecar race will also be full of interest, as it is the first track event in which this class of vehicle will compete. We hope it will be a success.

Auto Carriers Ltd. wish to deny a rumour that has circulated that they were building a special engine for the cyclecar race.

A.C.U. One Day Trial.

It is proposed to hold the annulled A.C.U. one day trial on April 24th, preferably on a course in the Midlands.

Lost at Sea.

A consignment of Singer motor cycles *en route* for Bombay was on board the *Oceana* when she foundered last Saturday.

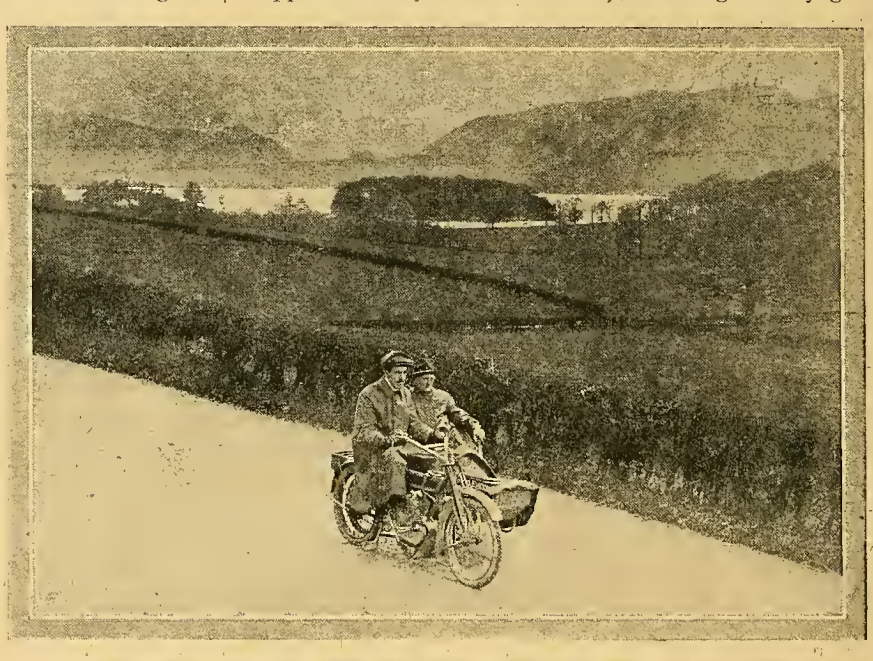
Herts County A.C. Open Trial.

An open reliability trial will be held on Saturday next. A good entry has been received, and the course, with slight alterations, will be the same as that used by the club on the occasion of its last reliability trials. The start will take place at 10 a.m. from the Salisbury Arms Hotel, Barnet, the length of the course being 100 miles.

Night Trial Results.

The results of the night trial held by the Purley and District M.C.C. on the 9th inst. are: 1, D. S. Ainger (1908 Triumph), Ralph Cole's Challenge Cup and silver medal; 2, R. Charlesworth (3½ Zenith sc.), medal; 3, E. J. Webster (8 Matchless sc.). E. M. Oliver (2¾ Humber) and W. G. Fowler (Rudge) were disqualified on technical grounds; the former made best score, and the latter would have taken third prize.

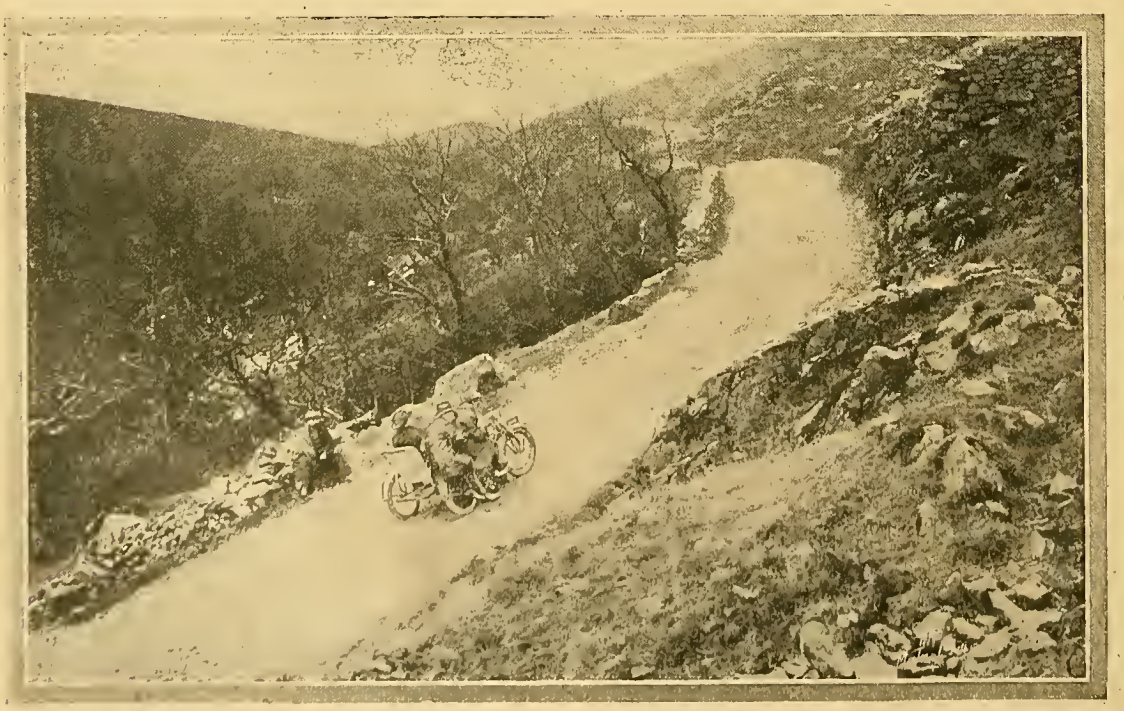
Abolition of Toll Bars.



We are informed, on absolutely reliable authority, that negotiations are being carried on between the Middlesbrough Corporation and the owners of the toll bars, which still exist in the Middlesbrough district, for the abolition of these relics of the past, and that in a very short time all five toll bars will cease to interfere with traffic on the roads. Middlesbrough is in an unenviable position, for on all the roads out of one side of the town there are toll bars—five in number—whilst on the road to South Bank, a distance of under three miles and one of the worst roads in the country, there are no less than three.

General view of the assembly at the foot of Aston Hill for the Essex M.C. Hill-climb last Saturday.

ANOTHER CLIMB UP HONISTER PASS.



ON Saturday last, C. R. Collier arranged to make an attempt on Honister Pass with a standard 8 h.p. Matchless and sidecar. Accordingly the Cumberland County M.C.C. made arrangements similar to those made for Frank Smith when he performed the wonderful feat of climbing the pass with his Clyno and sidecar with passenger on the 9th inst. The club are always glad to welcome to the hills and dales their comrades from the South and Midlands. Having assembled at Quirk's Garage at 2.30 p.m. and met C. R. Collier on his 8 h.p. Matchless and sidecar, the party then rode out to Honister, where the most remarkable epoch in the history of that remote region was completed.

C. R. Collier leaving Keswick for Honister Pass, which he successfully climbed with a passenger from the steepest (Buttermere) side from Gatesgarth.

The Descent.

At the top of the pass we met many more members of the Cumberland and Westmorland Clubs who were anxiously waiting in the mountain rain for our arrival. C. R. Collier descended the pass with F. S. Whitworth as passenger, and I followed on my machine to start them from Gatesgarth, the bottom of the pass. We skidded and rolled from side to side until eventually we reached the starting point. The members waiting on Hill Step in the meantime examined the state of the road, and considered it to be in normal condition, and the opinion was expressed that the machine would stick fast when it got its wheels into the loose shale. However, for the moment this was forgotten as a speck appeared away down the valley, which gradually got nearer and resolved itself into the Matchless, C. R. Collier, and his 11 stone passenger. Quickly they drew nearer until it was observed that their speed was abnormal for such a road. They travelled up the

C. R. Collier (8 h.p. twin Matchless sidecar) ascending Honister Pass by the old road from Borrowdale with three up. The two passengers are members of the Cumberland County M.C.C.

Another Climb up Honister Pass.—

pass at a speed verging on 20 m.p.h., swerving from side to side with the front wheel often at an acute angle from the line of direction. At the bridge about 300 yards below Hill Step the bottom gear was engaged, and the pace slackened to about 14 m.p.h. Could the road possibly be held at this pace? was the question on everyone's lips. Nearer came the machine, swerving and rolling, with the passenger performing wonderful balancing effects until the loose shale was encountered. Through this it ploughed from first the inside of the road to the outside, where yawns an unguarded drop of 100 feet over a precipice to the stream below.

Showers of Stones.

Upwards still it rushed, and after a moment of tense excitement Hill Step was reached. Round flew the driving wheel in the deep shale, and showers of stones scattered upwards and outwards in all directions, the speed alone carrying the machine and its load over the awful loose surface. Once over the Step the machine leaped forward, and the spectators yelled themselves hoarse. From there to the top of the pass the pace was accelerated and all went well, and a marvellous climb was accomplished. Collier then returned to Hill Step to examine the scene of his exploit.

I understand that the machine used was a standard one, which had recently been sold to a private individual. The gears, verified by the Cumberland Club, were 5 to 1 and 9⅞ to 1. The conditions throughout were most unfavourable, as it rained in real Lakeland fashion. Yet Collier, surely the impersonation of coolness and *sangfroid*, rushed up the pass at a pace simply frightful and nerve shattering to onlookers.

The old road on the Borrowdale side was then visited, and, starting from Seatoller, Collier invited two passengers to accompany him. These two were G. N. Gilbanks and J. Wallace-Moffet (Carlisle). Moffet took the carrier seat, and got a bumping such as he hopes he will never receive again. However, away the machine sped with its load and successfully reached the summit, and this performance, we think, must vie in interest and difficulty with that recorded on the Buttermere side.—W. B. LITTLE, Captain Cumberland County M.C.C.

THE MOTOR CYCLISTS' PROGRESSIVE ASSOCIATION.

AS mentioned in our issue of last week, the M.C.P.A. carried the day at the A.C.U. private members' meeting. That body, however, is not going to stop short at this point. It has other and more important work to do, and it means to do it. Very soon, if we mistake not, the M.C.P.A. will prove its worth and the effect of its efforts will very shortly be evident.

The *fiasco* of the one-day trial shows that there is much need of reform in the A.C.U., and here is a chance for the new committee. Why should it not appoint a permanent committee of management consisting of the principal officers of the Union, to whom the staff is directly responsible? These would form a small body of picked men of the A.C.U. who would meet together at frequent intervals and watch the interests of the Union week by week.

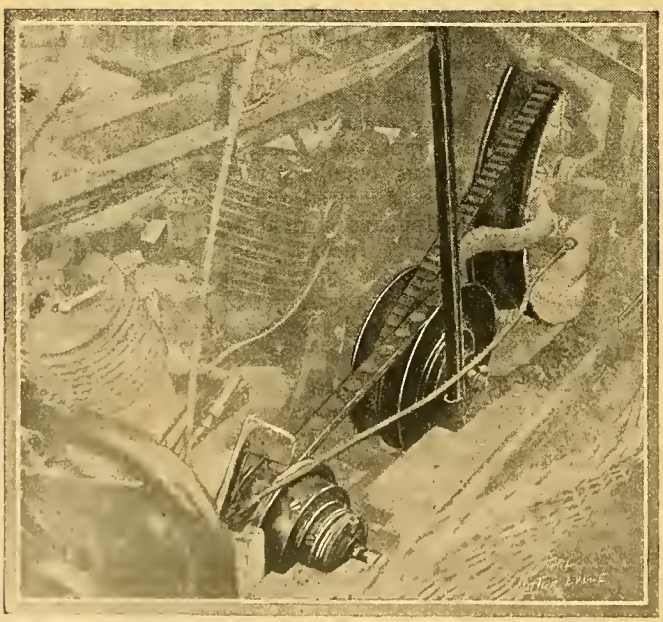
The Competitions Committee has done good work in the past, but in our opinion it has not gone far enough. It has worked out the outline of various trials and competitions, but has left the actual carrying out of these too much to the staff. Now on future occasions, we suggest, those of the Competitions Committee who can officiate during these trials, or who can keep in touch with them from their inception to their completion, should be absolutely responsible for their being successfully run.

The M.C.P.A. has been formed at a time when its services are badly needed. Its method of action is to be heartily approved, since, unlike other people who are not strong enough to effect reforms from within, who have separated from their parent body and have either founded a rival organisation or have ploughed the lonely furrow, the members of the M.C.P.A. have set to work to put their own house in order, and, unless we be mistaken, its chambers will be swept and garnished and its whole organisation reformed before many weeks be past.

That urgent and complete reform is needed is only too well apparent, but, unless we misjudge them, the new committee will stand no nonsense and will let nothing hinder the progress of reform. Moreover, the newly-elected body has good leaders, and good leaders are essential to a conquering army.

Start of the Hull and E.R.A.C.C. 100 Miles Non-stop Reliability Trial held last Saturday. **(See page 320.)**

M.C.C. LAND'S END AND BACK RUN.



The following additional entries have been received for the M.C.C. Land's End and back run, which will take place on April 6th-8th:

F. S. Procter (7 Indian sc.)
P. W. Moffat (2¾ Douglas)
H. R. Whitmore (3½ Rudge)
A. M. C. Scott (3½ Triumph)
S. F. Garrett (3½ Premier)
G. Boswell (3½ Ariel)
E. A. Babington (6 Bat)
H. C. Mills (3½ Premier)
H. Gibson (3½ Bradbury sc.)
C. Q. Roberts (3½ Rover)
J. Robertson Brown (——)
F. W. Ehlvers (3½ Triumph)
R. C. Davis (——)
H. G. Slingo (5-6 Clyno sc.)
N. O. Soresby (3½ Rudge)
G. L. Fletcher (2¾ Douglas)
P. Tippett (3½ Humber).

Entries at single fees close to-morrow, the 22nd, to Mr. Edwin Gwynne, White Lodge, Crediton Road, West Hampstead.

A SIMPLE VARIABLE GEAR.

MR. J. S. TRITTON, of the National Physical Laboratory, Teddington, has invented a simple form of variable gear, which he has, we understand, provisionally protected. It is fitted to a belt driven 1910 5-6 h.p. Clyno sidecar machine. Not that Mr. Tritton is a believer in belt drive on passenger carrying motor cycles, but he has wisely fitted it to his own mount so as to give it as severe a test as possible. The gear is known as the "Differo," as it depends on the differential action between two belts for its working. The gear itself is extremely simple. A bracket is carried under the motor cycle bottom bracket which supports a spindle on which the expanding pulley is pivoted. On the pulley shaft midway between the two outer flanges is a flange capable of sliding laterally thereon along a feather. If the pulley be pushed forward by means of the gear lever the one belt sinks down and the other rises and the gear

J. S. Tritton's Differo gear, showing expanding pulley on counter-shaft and operating lever.

ratio is lowered, if it be pulled back a higher gear is obtained. The spindle on which the gear is pivoted has a helicoidal groove cut in it in which a pin running through its bearing engages. This allows the whole gear to have a slight lateral movement, just sufficient, in fact, to ensure perfect alignment of the belts, as the gear is pushed forward or backward by means of the control lever. In actual practice the gear works admirably. The control lever works easily, and only one short movement is required to come down from the highest to the lowest gear, consequently no time is lost if a sudden change down be required. Any belt stretch is taken up by the two belts equally, and as the belts are always in line the wear on them is decreased.

DUBLIN & DISTRICT HILL-CLIMB.

This competition took place on the 18th inst. (Bank Holiday) on a hill leading off the Blessington Road, which owing to its bad surface proved rather severe for the low and medium powered machines. Results:

CLASS A.—Under 340 c.c.

J. P. Guinn (2¾ Douglas) failed.

CLASS B.—Under 520 c.c.

Rider and machine.	Time.	Formula.
T. E. Green (3½ Rudge) ...	1m. 29⅕s. ...	126.81
J. Healy (3½ Rudge) ...	1m. 31⅖s. ...	114.58
J. I. Harvey (3½ Rudge) ...	1m. 37⅕s. ...	145.21
R. H. Taaffe (3½ Triumph)...	1m. 42⅖s. ...	149.18

CLASS C.—Exceeding 520 c.c.

B. B. Harvey (8 Bat) ...	1m. 17⅕s. ...	204.6
C. B. Franklin (5 Indian)...	1m. 23⅗s. ...	139.4

IRISH MOTOR CYCLE UNION.

The Ulster and Dublin centres of the Motor Cycle Union of Ireland met, in conference, at Dundalk, on Saturday evening, to discuss matters relating to the Union. Mr. R. G. Lindsay, the president of the Ulster centre, presided, and Mr. R. McCann acted as secretary of the conference. It was decided to revive the annual inter-city contest between Dublin and Belfast, but on lines somewhat different from previous events. It is to take the form of a reliability trial between the two cities. The date of the event was fixed for Saturday, June 1st, to start from Belfast.

SIX DAYS' SIDECAR RIDE.

A. Butler, whose photograph recently appeared in these pages with sidecar carrying papers for the *Sportsman* to Gloucester, has recently accomplished a six days' ride on a 3½ h.p. A.S.L.-Precision motor cycle and Comfy sidecar, thereby creating a record, beating the previous distance ridden by Oliphant on a Premier by 113 miles. Before starting, Mr. Butler's machine was sealed by *The Motor Cycle*, and he established his distances by sending us his checking book, in which the accomplishment of each section is witnessed and the time booked by various people, such as newspaper publishers, motor agents, policemen, etc. He also sent postcards day by day to our offices, and of these thirty-nine were received from different places on the road. Mr. Butler claims to have made his ride of 1,459 under the legal limit. His machine was a 3½ h.p. A.S.L. fitted with Precision engine, U.H. magneto, Amac carburetter, Rom tyres, Stanley belt, L.M. plugs and F.R.S. lamp.

HILL-CLIMB IN S. AUSTRALIA.

THE annual hill-climbing contests of the Motor Cycle Club of South Australia were held on Greenhill Road on February 10th. There was great enthusiasm amongst the members, and the hill, which is 4 miles 148 yards long, was lined with spectators. G. Patterson, jun., who is touring the world partly for pleasure and partly to demonstrate New Hudson motor cycles, gained first place on formula in the open event. There were three contests, the first open to all members, second open to amateurs only, and third passenger class. The first two events were decided on formula and the passenger class on fastest time, the combined weight of driver and passenger to be not less than 20 stones. The grade of the hill varies from 1 in 8 to 1 in 25, average 1 in 14. The results were as follow:

OPEN CONTEST.

	Weight. lbs.	Time. m. s.	Points on formula
1. G. Patterson, jun. (2¾ New Hudson)	324	8 46	401
2. N. K. Torode (3½ Triumph)	363	7 28	362
3. A. Carnell (3½ w.c. Lewis)	366	7 56	324
*H. H. Ragless (3½ Triumph) ...	320	7 26⅗	321

*Fastest time.

AMATEUR EVENT.

1. H. W. Crowle (3½ Triumph) ...	318	8 23⅖	252
2. C. R. Churchward (3½ w.c. Lewis) ...	386	9 19	247
3. R. Barr Smith, jun. (7 Indian) ...	363	8 44	232

PASSENGER CLASS.

1. A. E. Young (3½ w.c. Lewis sidecar)	15m. 10s.
2. W. Sampson (7 Peugeot forecar)	17m. 15s.

THE ESSEX M.C. OPEN HILL-CLIMB.

F. W. Barnes (8 h.p. Zenith and sidecar) passing the timekeeper at the foot of the hill.

ESSEX boasts no hills worthy of the name, so the Essex Motor Club had perforce to search other counties for a suitable gradient on which the powers that be would allow a hill-climbing competition. Our dear old friend Aston Hill, near Tring, was found, and so well was the secret of the venue of the competition kept that not a single competitor made the ascent before the event was run off. It had rained very heavily in the night, and those who journeyed to Tring by road found patches of grease at frequent intervals, and soft, rutty places, which rendered the going far from pleasant.

Thanks to the courtesy of Cass's Motor Mart, Warren Street, Tottenham Court Road, we were enabled to reach the scene of the competition on a 4 h.p. three-speed Quadrant, which took every hill with a vigour that was altogether enjoyable, and ran as smoothly as the most blasé connoisseur could wish. The car class was down first on the programme, but, owing to the fact that the heavier vehicles might cut up the road, the motor cycle passenger class and the remaining motor cycle classes were run off first. The surface of the hill was in good condition, save for the ruts which are always to be found thereon. The passenger class for machines not exceeding 1,000 c.c. was thrown open to cyclecars, but none of these vehicles were entered.

Passenger Class.

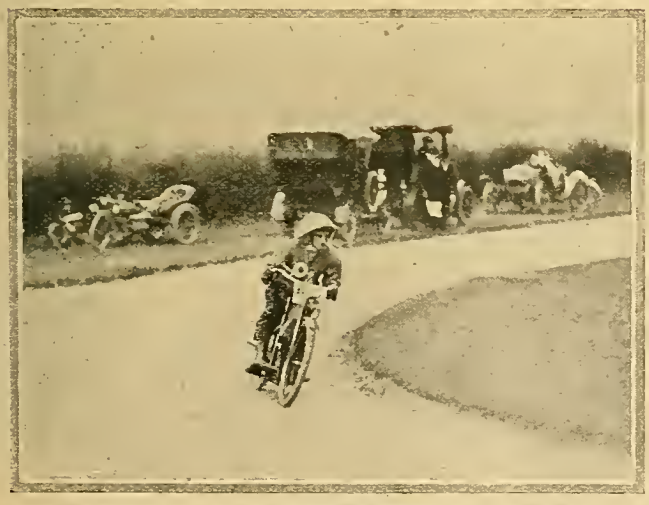
Barnes made the most sensational performance in this section of the event, while Applebee, on the Scott, and W. Pratt did extremely well. The results in this class were decided on A.C.U. formula:

	Rider and machine.	Time.	Fig of merit.
1.	F. W. Barnes (6 Zenith and sc.) ...	1m. 7⅕s. ...	78.6
2.	W. Pratt (3½ P. and M. and sc.) ...	1m. 39⅕s. ...	96.5
3.	D. S. Kapadia (8 Rex-Jap and sc.)	1m. 27⅖s. ...	126
4.	F. A. Applebee (3¾ Scott and sc.) ...	2m. 13⅘s. ...	127
5.	B. A. Hill (7 Indian and sc.) ...	1m. 20⅗s. ...	130

Hill had the bad luck to lose valuable time at the summit through a slipping clutch.

CLASS A.—For machines not exceeding 275 c.c.

The honours for this class fell to the S.I.A.M.T., the new Italian lightweight which made its *début* at the last Show, since it gained first and third places. Holloway (Premier), of whom more will be heard later, also put up a good performance. Results:



1.	C. R. Marshall (2¼ S.I.A.M.T.) ...	1m. 3s.
2.	R. Holloway (2½ Premier) ...	1m. 9s.
3.	F. C. Scales (2¼ S.I.A.M.T.) ...	1m. 14⅗s.
4.	N. D. Slatter (2 Alcyon) ...	1m. 15⅕s.
5.	Lieut. R. H. K. Hope, R.N. (2½ Levis)	1m. 36⅘s.
6.	F. W. Applebee (2 Centaur) ...	1m. 38⅗s.

CLASS B.—For machines not exceeding 350 c.c.

Zeniths, it will be seen, distinguished themselves in this class, as Weatherilt carried off the gold medal. Mundy, who took second place, rode an absolutely standard machine with lamp, pedals, and upturned handle-bars. Results:

1.	P. Weatherilt (2¾ Zenith) ...	1m. 4s.
2.	R. G. Mundy (2½ Singer) ...	1m. 6s.
	*W. Bashall (2¾ Humber) ...	1m. 6⅗s.
3.	W. A. Jacobs (2½ Singer) ...	1m. 7⅘s.
4.	J. P. Legrand (2½ Singer) ...	1m. 9⅕s.
5.	H. C. Newman (2½ Ivy-Precision) ...	1m. 11⅘s.
	*A. Bashall (2¾ Humber) ...	1m. 13⅗s.
6.	F. E. Pither (2¼ Humber) ...	1m. 14⅖s.
7.	F. W Applebee (2¾ Centaur) ...	1m. 15⅘s.
8.	G. L. Fletcher (2¾ Douglas) ...	1m. 16⅘s.
9.	N. D. Slatter (2 Alcyon) ...	1m. 17⅖s.
10.	C. Pearson (2¾ Douglas) ...	1m. 24⅗s.
11.	F. C. Dear (2¾ Douglas) ...	1m. 25⅘s.
12.	J. S. Holroyd (2½ Motosacoche) ...	1m. 33s.
13.	W. Aslen (2½ Grandex) ...	1m. 40s.
14.	C. S. Franklin (2½ Singer) ...	1m. 43⅖s.
15.	Miss Hammett (2¾ Douglas) ...	1m. 53⅖s.
16.	T. E. Sear (2½ Motosacoche) ...	1m. 55⅘s.

*Signifies disqualified for excessive noise.

Miss Hammett the only lady competitor, taking the first corner on her 2¾ h.p. Douglas.

Disqualified for Noise.

It is a pity that certain machines had to be disqualified through noise, especially in cases where they did well, viz., the Bashalls' Humbers, which made splendid ascents, and Elce's Rudge in the class with which we are about to deal, but it is the only way in which pressure may be brought to bear upon the manufacturers to pay more attention to silencing.

CLASS C.—For machines up to 500 c.c.

In this class there were some interesting and exciting incidents. Holloway was impeded on his first attempt, but on his second try he roared up to the summit in splendid

W. Cooper starting E. H. Lee (5 h.p. Indian).

form, sitting his Premier as if it were part of him, and taking the top corner in a manner which evoked murmurs of approval on all sides. Cook and Gray, mounted on Rudges, both swerved in the ruts; B. Patterson (Brown) pulled up abruptly in the middle of a good ascent through a fouled plug or choked carburetter; South, another Rudge rider, switched off as he took the curves; Graham Dixon, on a single-speed New Hudson, took his corners particularly well. Oliphant (Premier) rode without a contact breaker cover, and was brought to a standstill at the first bend through the ring on which the cams are fixed coming off. Oldman (Bat) appeared to suffer from too high a gear and came up slowly. Result:

1.	R. Holloway (3½ Premier)	0m. 49⅗s.
	*W. H. Elce (3½ Rudge)	0m. 54⅘s.
2.	H. C. Newman (3½ Ivy-Precision)	0m. 55⅗s.
3.	H. G. Dixon (3½ New Hudson) ...	0m. 55⅘s.
4.	S. R. Cook (3½ Rudge)	0m. 56⅖s.
	*Vernon Taylor (3½ Rudge)	0m. 57s.
5.	G. T. Gray (3½ Rudge)	0m. 58⅖s.
6.	H. V. Smytheman (3½ Ivy-Precision)	0m. 59⅖s.
	T. Weatherilt (3½ Zenith)	0m. 59⅖s.
8.	W. D. South (3½ Rudge)	1m. 0⅕s.
9.	G. Griffith (3½ Rudge)	1m. 1s.
10.	H. E. Parker (3½ N.L.G.)	1m. 2⅗s.
11.	W. O. Oldman (4 Bat)	1m. 3s.
12.	F. A. McNab (3½ Trump-Jap) ...	1m. 5⅘s.
13.	G. L. Fletcher (2¾ Douglas) ...	1m. 16s.
14.	E. Gwynne (3½ Rudge)	1m. 18s.

CLASS D.—For machines not exceeding 750 c.c.

Barnes again proved the worth of the Zenith-Gradua, and made a splendid ascent. Lees made a picturesque climb with one legging half detached and flying out in the wind. Newman came up well wearing a weird headgear. Result:

1.	F. W. Barnes (6 Zenith)	0m. 50⅖s.
2.	R. Holloway (3½ Premier)	0m. 52⅗s.
3.	H. C. Newman (3½ Ivy-Precision)	0m. 53⅕s.
4.	H. G. Dixon (3½ New Hudson) ...	0m. 53⅘s.
5.	V. Taylor (3½ Rudge)	0m. 54⅕s.
6.	W. D. South (3½ Rudge)	0m. 55⅖s.
7.	E. H. Lees (5 Indian)	0m. 56⅗s.
8.	H. V. Smytheman (3½ Ivy-Precision)	0m. 58⅕s.
9.	E. Gwynne	1m. 18s.

CLASS E.—For machines up to 1,000 c.c.

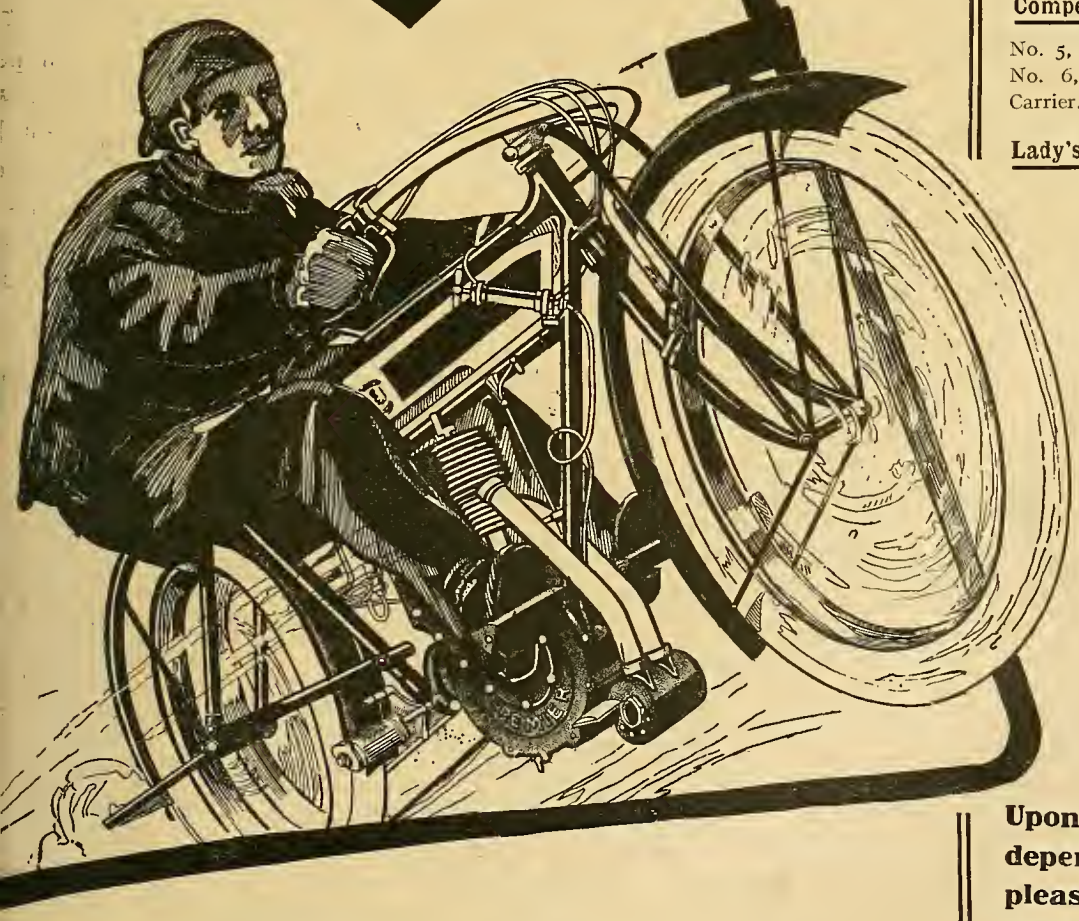
This provided one or two exciting incidents. Moorhouse took the second bend rather too close in and then pulled up suddenly with a broken chain. Hal Hill's rear tyre, which had previously given trouble, collapsed at the second corner, sending him all over the road. But clever manipulation saved a nasty spill. Barnes and B. A. Hill both made splendid ascents and rode in fine form. Results:

1.	B. A. Hill (7 Indian)	0m. 48s.
2.	F. W. Barnes (8 Zenith)	0m. 48⅕s.
3.	E. H. Lees (5 Indian)	0m. 54⅖s.
4.	H. G. Dixon (3½ New Hudson) ...	0m. 54⅘s.
5.	D. S. Kapadia (8 Rex-Jap)	1m. 7⅕s.
6.	E. Gwynne (3½ Rudge)	1m. 10⅕s.

Excellent Organisation.

The classes were run off promptly, thanks to the excellent offices of Mr. W. Cooper, who officiated at the start. Mr. R. Selz did excellent work in working out the formulæ, Messrs. J Salmon, W. Whittal, and Andrews were invaluable as marshals, while Mr. J. A. Macdonald worked hard at the scales at Boxmoor Station. Mr. E. J. Bass acted as hon. organising secretary, Messrs. A. G. Reynolds and J. W. G. Brooker acted as judges, Mr. A. V. Ebblewhite took the times at the foot, and Mr. J. H. Burley officiated in a similar capacity at the summit. A report of the car class will appear in next Friday's *Autocar*.

In each class a gold medal was awarded to the first competitor and a silver to the second, while in some classes medals were given for members and novices as well. The prize list, therefore, is a remarkably large one.



The Leicestershire Centre of the R.I.A. are arranging a practical demonstration on April 22nd, to be attended by motor cyclists and other road users, of the greatly reduced risk of accident that would accrue if all other forms of road traffic would, upon their own initiative, carry reflex rear lights. Road users are invited to attend, and the hon. sec. to the centre (Mr. S. C. Winks, 3, Sweetbriar Road, Leicester) will gladly forward further details.

W. Pratt (3½ h.p. P. & M. and sidecar) making a good ascent.

B.M.C.R.C. MEETING.

The following entries have been received for the Spring meeting of the B.M.C.R.C., at Brooklands, on Saturday next, the 23rd inst. The first race will start at 1 p.m. :

1 P.M.—THE THREE-LAP SIDECAR SCRATCH RACE.

T. A. Carter (2 Matchless)	C. R. Collier (2 Matchless)
J. T. Bashall (2 Bat-Jap)	C. F. Hunter (2 Zenith)
H. A. Collier (2 Matchless)	W. W. Smith (1 Rudge)
B. Alan Hill (2 Indian)	W. L. T. Rhys (2 Zenith)
F. W. Barnes (2 Zenith)	S. T. Tessier (2 Bat-Jap)

1.30 P.M.—100 MILES ALL-COMERS' RACE.

CLASS A (275 c.c.).

R. Holloway (1 Premier)	H. Martin (1 Martin-Jap)
N. D. Slatter (1 Alcyon)	

CLASS B (350 c.c.).

H. Martin (1 Martin-Jap)	W. Bashall (2 Humber)
J. Harrison Watson (2 Humber)	A. E. Woodman (2 Humber)
A. Bashall (2 Humber)	S. Wright (2 Humber)

CLASS C (500 c.c.).

P. Brewster (1 Norton)	S. Russell Cooke (1 Rudge)
W. O. Oldman (2 Bat-Jap)	W. D. South (1 Rudge)
A. P. Maurice (1 Premier)	M. J. Stretch (1 Rudge)
O. C. Godfrey (1 Indian)	Vernon Taylor (1 Rudge)
N. A. Ayres (1 Singer)	S. T. Timson (1 Rudge)
S. C. W. Smith (1 Singer)	Stanhope Spencer (1 Rudge)
G. E. Stanley (1 Singer)	P. J. Wallace (1 Rudge)
Howard Smith (1 Triumph)	L. Wallace (1 Rudge)
J. R. Haswell (1 Triumph)	E. B. Ware (1 Rudge)
W. L. T. Rhys (1 Triumph)	C. T. Newsome (1 Rover)
W. H. Elce (1 Rudge)	H. Millidge (1 Rover)
W. F. Guiver (1 Rudge)	

CLASS D (750 c.c.).

R. L. Printz (2 Bat-Jap)	Hal Hill (2 Bat-Jap)

CLASS E (1,000 c.c.).

F. W. Barnes (2 Zenith-Jap)	A. G. Miller (2 Matchless-Jap)
A. Moorhouse (2 Indian)	

CLASS C (with sidecar).

G. Griffith (1 Rudge)	W. W. Smith (1 Rudge)

CLASS D (with sidecar).

S. T. Tessier (2 Bat-Jap)

CLASS E (with sidecar).

T. S. Carter (2 Matchless)	H. A. Collier (2 Matchless)
J. T. Bashall (2 Bat-Jap)	S. R. Axford (2 Zenith-Jap)
B. Alan Hill (2 Indian)	G. F. Hunter (2 Zenith-Jap)

5.10 P.M.—THE NEW-COMERS' RACE.

L. N. Palmer (1 Bedelia)	H. Martin (2 Morgan-Jap)
S. H. Edmunds (2 Autotrix-Jap)	O. C. Godfrey (2 Rollo-Jap)
G. Wadden (2 Autotrix-Jap)	H. Ward (2 Bedelia)
	E. D. Tate (2 Sabella-Jap)
	W. Ward (2 Bedelia-Jap)
	J. Robinson (Sabella)

INTER-CLUB RELIABILITY TRIAL.

THE South-East London M.C.C. and Woolwich, Plumstead and District M.C. inter-club team trial on Saturday last was remarkably successful, the Woolwich Club being the winners by a margin of twenty marks. Starting from the Fox, Keston, the first point of interest was Cudham Church Hill, which was in very good condition. Here the only competitor to fail was F. G. Simmons (3½ F.E. Triumph), who pedalled and "konked" out just after the second bend. The rest took the hairpin excellently, while of the sidecar machines J. W. Woods (6 h.p. Enfield two-speed) and S. Browne (3½ h.p. James two-speed) were the best. Taking the hairpin to Green Street Green, the competitors went by way of Riverhead, Bessells Green, and Westerham village to Westerham Hill, where F. G. Simmons was again unfortunate, and H. A. Collier (8 h.p. Matchless and sidecar two-speed) knocked at the top, but did not succumb. From here the main road was taken back to the start, where the competitors turned to cover the course again. On the second ascent of Cudham Church Hill F. Roberts (3½ h.p. Rudge) took the hairpin too fast and ran into the bank, while on Westerham Hill W. Davis (3½ h.p. Rudge) stopped with a frozen carburetter and unconcernedly set fire to it to get going again. The following were the performances on Cudham Church Hill.

S.E.L. M.C.C. TEAM.

1. N. Daintree (5 h.p. Chater-Peugeot two-speed). Excellent on both rounds.
3. E. H. Paul (3½ h.p. P.V. twin two-speed). Excellent and very quiet.
5. G. Brown (3½ h.p. Zenith). Excellent.
7. F. G. Simmons (3½ F.E. Triumph). Failed each round.
9. F. Roberts (3½ h.p. Rudge). Excellent, very fast.
11. S. Browne (3½ h.p. James and sidecar two-speed). Excellent. The way this machine with sidecar and passenger ascended the hill, and gained full marks was remarkable. It is, we are informed, the first single-cylinder sidecar machine to go up this hill.

W.P. AND D. M.C. TEAM.

2. A. J. Galley (5 h.p. M.O.B.M. two-speed). Excellent on both rounds.
4. W. Davis (3½ h.p. Rudge). Excellent.
6. J. W. Wood (6 h.p. Enfield and sidecar two-speed). Excellent; reported to be the best sidecar performance.
8. R. E. Guest (6 h.p. Matchless and sidecar two-speed). Excellent.
10. H. A. Collier (8 h.p. Matchless sc. 2-speed). Excellent.
12. J. Tassell (8 h.p. Matchless and sidecar two-speed), Excellent.

Nine of the competitors came through without loss of marks, while the time was remarkably regular, S. Browne on the first round being only five seconds out, and J. W. Wood only six seconds out for the two rounds.

Birmingham M.C.C. Opening Run. Members and friends grouped round the Old Maypole, on the Alcester Road.

CLUB NEWS.

Maidenhead and District M.C.C.

This newly-formed club held its first run on the 10th inst. to Arms Hill. The attendance was good, and the run much enjoyed, despite the bad condition of the roads.

Isle of Wight M.C.C.

The first general meeting was held at Newport on the 5th inst., Dr. C. G. Thompson in the chair. The officers and committee for the ensuing year were elected, and the membership, already totalling fifty, promises well for the success of the new club. It has been decided to affiliate to the A.C.U.

Ilkley and District M.C.C.

A breakdown competition was held at headquarters on Tuesday, March 12th, for a prize, consisting of a motor cycle accessory, offered by Mr. Stell.

After a keen competition the winner proved to be Walter Robinson, who located and rectified the two faults in two minutes three seconds.

Hull and East Riding A.C.C.

A non-stop run to Seamer and back was held on the 16th inst., the route being through Beverley, Driffield, and Hunmanby, returning through Bridlington, a total distance of 100 miles. Eight members started. J. F. Walton (3½ Rudge), J. E. Emerson (3½ Norton), A. E. Tuton (3½ Bradbury), and J. Gascall (6 Clyno and sidecar) made non-stops.

Batley and District M.C.C.

The annual general meeting took place on the 29th ult., at headquarters, and the following officers were elected: President, Dr. Lee Potter; hon. treasurer, Mr. E. A. Golby; hon. secretary, Mr. Joseph Hazzlewood, 36, Commercial Street, Batley. The first event of the season will be a run to Blubberhouses, and a speed-judging competition will be held in conjunction.

Cardiff M.C.

At the last meeting of the committee the following competitions were arranged, in addition to the open hill-climb and open speed trial in July: April 5th, opening meet at the Speech House, and hill-climb; April 13th, speed-judging trial; May 11th, club hill-climb; May 27th, twelve hours' reliability trial.

A challenge trophy has been presented to the club by Mr. R. Bevan, and a cup by Mr. A. Williams, the chairman.

Llanelly and District M.C.C.

A meeting was held at the Thomas Arms Hotel on the 14th inst., and it was unanimously resolved to form a motor cycle club, Mr. Sydney D. Morris in the chair. About forty members were represented, and the following officials were appointed: Captain, Mr. Tudor Thomas; vice-captain, Mr. S. D. Morris; hon. treasurer, Mr. E. M. Williams, G.P.O.; hon. secretary, Mr. J. Bryn Morgan, 24, Park Street, Llanelly. Motor cyclists in the district are cordially invited to the next meeting on April 1st, at 8 p.m., Thomas Arms Hotel.

Bristol M.C.C.

A lecture on "Speed and Power," by Mr. McMinnies, was given before the above club on the 14th inst. On the 23rd inst. an inter-team match will be carried out with the Exeter Club, at Bridgwater; meet at headquarters at 2.30. On the 30th inst. the spring competition will take place; the event will be about sixty miles non-stop over a circular course, starting from Keynsham at 2.45.

Western District M.C. (London).

The club runs for this week-end are to Staines on the 23rd inst. and to Reigate on the 24th inst. Mr. Raworth, the designer of a 2½ h.p. petrol motor attachment to ordinary push bicycles, has been invited to meet the club at the top of Reigate Hill between noon and 12.30 to demonstrate the device. On the 31st inst. the first competition of the season, a reliability trial, takes place for the N.S.U. gold medal over a course of 104 miles.

Coventry and Warwickshire M.C.

On Friday evening, the 15th inst., the annual general meeting was held at the King's Head Hotel, Coventry, when the secretary's report and balance sheet were presented. The report of the year's work proves that the Coventry and Warwickshire Motor Club is an active body, doing good work in the interests of motorists generally. The balance sheet shows a handsome balance of £275 odd.

Mr. M. J. Schulte was elected president for the ensuing year, and the following vice-presidents were added to the list: Messrs. John V. Pugh, A. H. Bush, and C. H. Elson. Mr. G. Smith was re-elected hon. secretary, with Mr. A. Elson as assistant secretary. Mr. A. Wright was also re-elected as hon. treasurer. The following names were added to the committee: Messrs. H. Belcher, B. S. Gorton, J. W. Roebuck, A. E. Dover, F. S. Pountney, H. Lister Cooper, and E. A. Isherwood.

It was resolved to contribute twenty guineas to the R.A.C. touring guide scheme under certain conditions.

The next day, Saturday, the opening run and speed-judging competition was held, members meeting at the residence of the new president, Mr. M. J. Schulte, "Hill Crest," Kenilworth. Over sixty assembled. The competitors drew lots for the speeds they were to average at the start, and the "hare" car—a 12 h.p. Humber—with Messrs. H. Belcher and G. Smith aboard, laid a tortuous trail of about twenty-five miles among the lanes.

Tea was subsequently taken at the Golden Lion Hotel, Stratford-on-Avon, when the results were announced:

Motor bicycles: 1st, H. Lister Cooper (Triumph), ½m. slow; 2nd, B. S. Gorton (Rex), 5¾m. fast; 3rd, V. A. Holroyd (Rudge), 11½m. slow.

Cars: 1st, E. J. Hardy (Rover), 5½m. slow, and J. Bachelor (Triumph sidecar), 5¼m. slow, tie; 3rd, G. T. Mills (Rover), 5¾m. slow.

Particulars and entry forms for the open reliability trial on May 4th will be ready very shortly, and will be posted to all motor cyclists interested in the event.

Members and friends of the Coventry and Warwickshire M.C. assembled for the opening run at Hill Crest, Kenilworth, the residence of Mr. M. J. Schulte, the new president.

HUNTS Ltd.

The City & West End Motor House,
117, Long Acre, London, W.C.

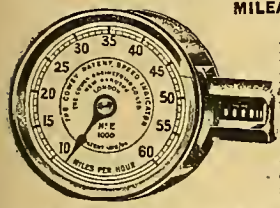
RELIABLE ACCESSORIES AT LONDON'S LOWEST PRICES

THE HUNT "ANTARNISH."

A non-greasy, weatherproof, and INVISIBLE Lacquer for applying to the plated parts of Motor Cars, Cycles, etc., and also to bare clean steel, brass, or any other metal.
Price per tin, 9d. Postage 3d.

THE HUNT "ROSCO" CYLINDER PAINT.

Keeps the engine cool, prevents overheating, produces a smooth dead black surface. Unaffected by heat or water.
Price per tin, 6d. Postage 2d.



THE HUNT "COVEROLE." For Repairing Leaky Petrol Tanks, Pipes, Unions, etc.

DIRECTIONS:

For Worm Unions.—Paint the treads and cone liberally with Coverole, screw up tightly, and give a final application to the outside.

For Cracked Pipes, etc.—Smear a piece of paper, canvas, tape, or similar material with Coverole, and wrap tightly round the pipe. Price 1/- Postage 2d.

THE COWEY SPEED INDICATOR AND MILEAGE RECORDER (Guaranteed).

Registers a speed up to 60 miles per hour. Mileage recorder registers up to 10,000 miles, then automatically starts again. The indicator can be easily attached by any motorist, and once fitted requires no attention or adjustment whatever. It will continue to render good service as long as it is attached to the cycle, for it is constructed throughout of the best and most suitable materials by expert British mechanics at Kew Gardens.
Price, in Nickel, 84/-, carriage paid.

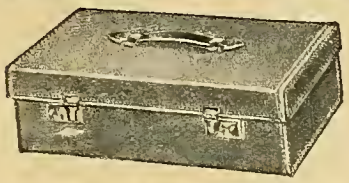
THE HUNT DRIP FEED LUBRICATOR.

For inserting in existing oil pipe. Adjustable to any number of drips. Oil can be forced through by pump if desired
Price (plated) 5/6, postage 2d.

THE HUNT Valve Spring Remover.

By means of the compound action the stoutest spring is easily raised by a slight turn of the winged nut, leaving both hands free.
Price 2/6, postage 2d.

THE HUNT "ACME" WATCH AND CASE.

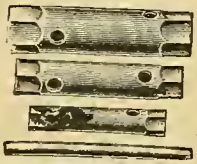


These Watches are constructed to stand vibration. Each watch guaranteed for 12 months. To clip on handle-bar. Very neat. Made in Aluminium. Complete with Ingersoll Watch.
Price 8/6, postage 2d.
Case only, 3/6

THE HUNT ALL METAL SWITCH.

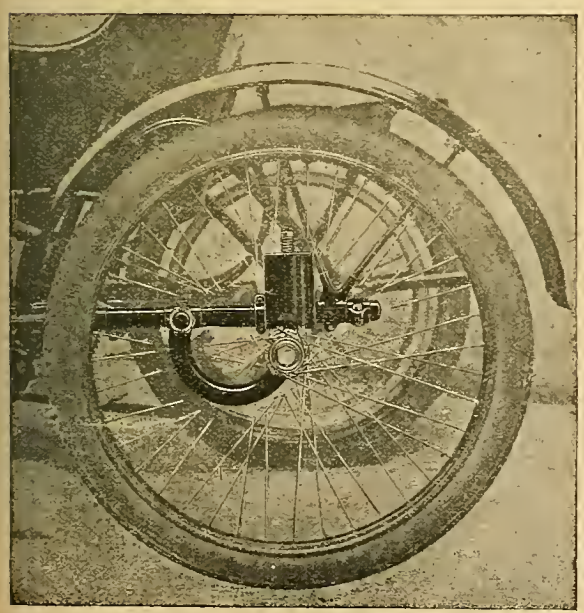
The design of this Switch is so extremely simple that there is nothing to it to get out of order; the contact is quick and definite for both make and break. The whole of the [illegible] is made out of heavy sheet brass, well finished and nickel-plated: the terminal is insulated with extra large ebonite washers, and the fixing clip is attached by a bolt and a nut passing through the sides of the metal case, thus ensuring a reliable attachment to the handle-bar.
Price. One Way 2/3. Two Way 2/9, postage 1d.

THE HUNT NEW MODEL COMPACT VALISE.



Length, 18in.; width, 11in.; depth, 6in. Manufactured of finest cowhide. Strengthened inside with strong hide-covered metal bands, and at the bottom with two wood batons which prevent bag being chafed by carrier. The inside is lined with a strong twill, and the outside is fitted with two spring lever locks and handle. The bag is strongly riveted throughout, and it is impossible for it to lose its shape. The handle enables it to be also used as a Suit Case. Fitted with two leather straps 48×1½in. for attaching to carrier. The motor cyclist can carry sufficient clothing inside this case to last him for a fortnight's tour. On arriving at his hotel, the bag can be taken to his room as an ordinary portmanteau. Finished in dark nut-brown leather. Price 30/-.

THE WESTWOOD specially prepared Repair Bands.



For use on outside of cover after same has burst or been gashed. The outside edges are tucked inside rim, i.e., between rim and cover.
Price 1/-, postage 2d.
Ditto for inside, 8d.

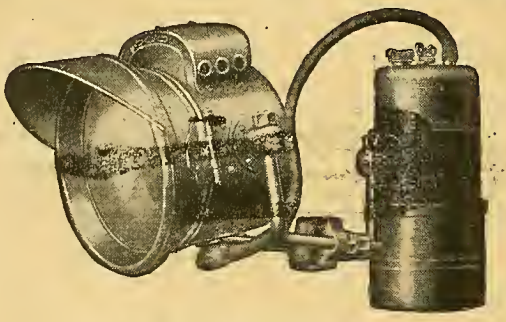
THE HUNT Motor Cycle Box Spanners.

Containing six sizes, with tommy. English manufacture. Guaranteed.
Sizes ¼, ⅜, ⅜, ⅝, ½, ⅝in.
Price 2/6 set, postage 3d.

Make your passenger comfortable by fitting a

GLORIA
SIDECAR

to your Motor Cycle.



This sidecar is beautifully roomy and luxuriously upholstered, but the patented device of spring suspending the wheel is the feature which makes this car a mechanical triumph. In addition the body work is hung on Cee Springs so that no road shocks are felt, and the rider of the motor does not feel the vibration usually inseparable from a Motor and Sidecar outfit. It is eliminated by the Gloria Suspension.

Booklet describing this and other unique features post free.

Gloria Cycle Co., Ltd., Coventry.

P&H
HIGHEST GRADE

The World's Most Reliable Acetylene Motor Cycle Lamp.

The "P. & H." Acetylene Headlight Set ..... No. 125.

A powerful projector Lamp fitted with a Roni Non-carbonising burner, special Mangin Lens Mirror, and best plate glass bevelled Convex Lens. Has special Bracket, suiting Lamp Bracket or Ball Head, upon which the Lamp can be reversed if required. Special Generator with adjustable Bracket, of the highest quality and efficiency, complete with best grey rubber Tubing. Can be attached to cycle in three ways.

Height.	Weight.	Front.	Lens.	Best Finish.
7in.	2¾ lbs.	5¼in.	4½in.	Plated on Brass.

Price ..... complete ..... 1 : 7 : 0

Or if without Generator .... Price .... 0 : 17 : 6

¶ —We recommend this Headlight to all who desire a perfect "Light" equipment without being asked to pay a high price for it.

¶ —Reliability is the outstanding feature of the "P. & H." products. See the name is on your Lamp and you're safe from lamp troubles.

¶ —Obtainable of all Agents—"Lamp Booklet" describing all models sent free on request.

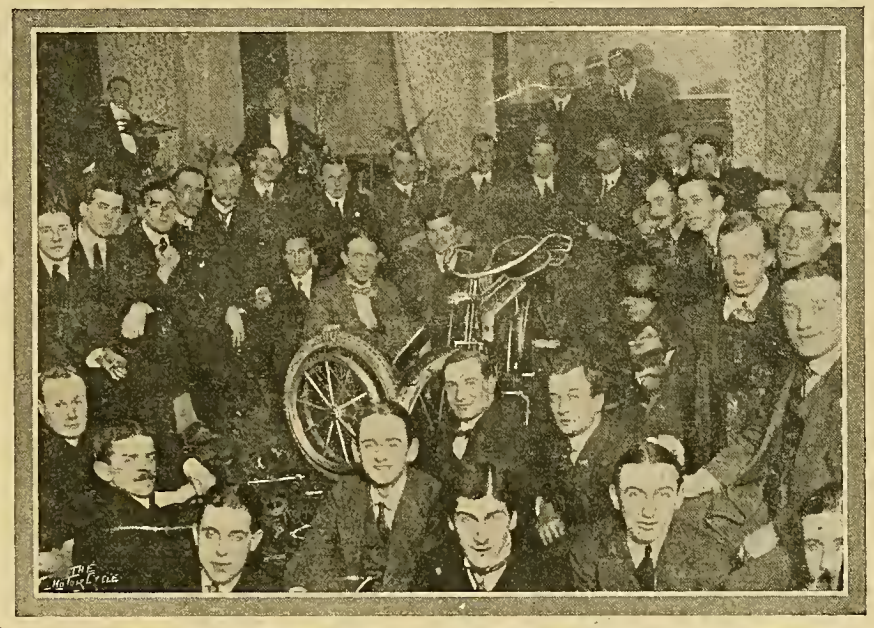
Club News.—

Purley and District M.C.C.

The night trial, one of the most successful competitions the club has so far organised, was carried through on Saturday, the 9th inst., mostly in heavy rain. The schedule speed of 15 m.p.h. was too slow for Olsson (Trump-Jap), who "toured round comfortably" and arrived at all the controls too early. The route was *via* Dorking and Bury Hill to Worthing, then by the inland road to Brighton, and home *via* the main Brighton Road and Reigate, total distance 113 miles. The best performances were put up by E. M. Oliver (2¾ h.p. Humber), D. S. Ainger (Triumph), W. G. Fowler (Rudge), and H. B. Willoughby (Rudge), but the actual awards will not be known until next week. The rain and the heavy roads caused several failures on Bury Hill, and Arundel seemed an unlucky place, for most of the competitors began to lose ground at this control for various reasons. Tomkins (Rover and sc.) punctured, Axford (8 h.p. Zenith and sc.) had lamp trouble and ran into Worthing over an hour late with an electric torch for head light, Kemp (6 h.p. Zenith and sc.) ran out of petrol at Arundel, and Symonds (Triumph) sacrificed his chance of winning by stopping to transfer some of his own supply to Kemp's tank. Willoughby took a toss on the vile road between Worthing and Brighton, and Gaskins (Rudge) had his magneto driving pinion come adrift near the foot of Handcross, whilst D. H. Ebbutt (Precision) broke his exhaust valve near the same place. Everybody finished somehow or other, despite the long delays which fell to some of the unfortunates. The secret controls, of which there were six, were arranged by Mr. Brett with the assistance of several willing helpers, three of whom were not members of the club nor even motor cyclists, but showed themselves immensely interested in the contest.

Sussex M.C.C.



At the meeting held at the Fountain Hotel, Worthing, on Saturday, the 9th inst., the following runs were arranged: March 17th, at 10.30 a.m., starting from Old Shoreham Bridge, to Lewes; March 23rd, at 2.30 p.m., to Horsham; March 24th, at 10.30 a.m., to Midhurst.

Kingston and District M.C.C.

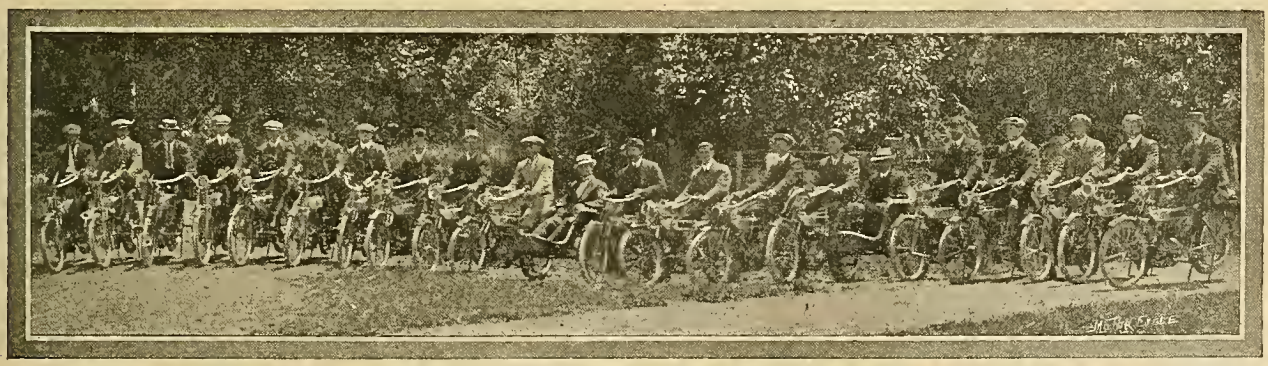
A meeting was held on the 8th inst. with the object of forming a motor cycle club for Kingston-on-Thames. Intending members are asked to write to Mr. A. Strutt (hon. secretary *pro tem.*), Chesfield Road, Kingston-on-Thames, Surrey.

Leeds M.C.C.

At the annual general meeting of the above club, held in the Grand Central Hotel, Mr. Rowland Winn presiding, the following officers were elected for the coming year: President, Mr. Rowland Winn; hon. secretary, Mr. G. B. Corner; hon. treasurer, Mr. J. H. Gash. The president announced the probability of a new and interesting competition, and the committee are arranging an attractive list of events. The membership of the club is now about 100.

A new Manchester Club. This amateur body recently arranged a supper, after which a Triumph clutch machine was dismantled by a representative of the makers.

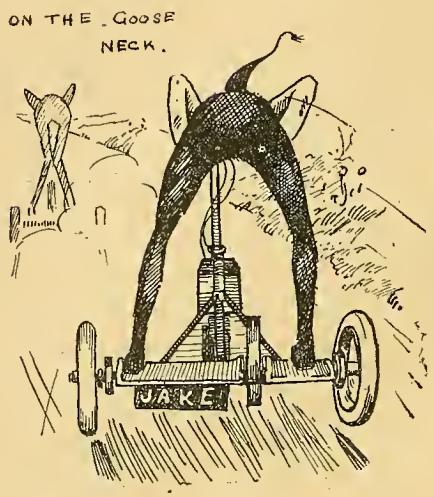
Manchester Amateur M.C.C.



A very successful hot-pot supper was held on the 11th inst., at the Moslev Hotel. A demonstration of the dismantling of a Triumph machine, by the Triumph Cycle Co., was much appreciated by the forty-four members and friends present. The photograph shows the scene during the dismantling of the engine.

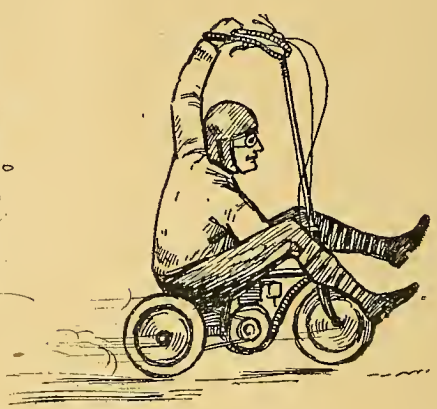
Portsmouth and District M.C.

As a meeting held at the King's Hotel it was decided to form a motor club. Mr. F. Tappenden, 18, Albert Road, Southsea, was elected hon. sec. and treasurer.



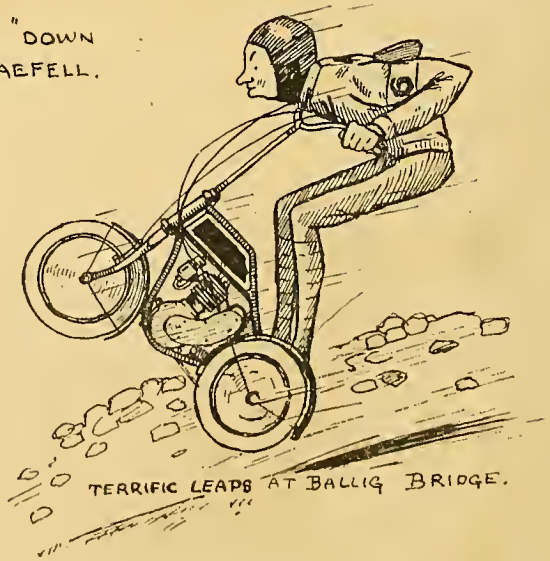
Finsbury Park C.C. (Motor Cycle Section).

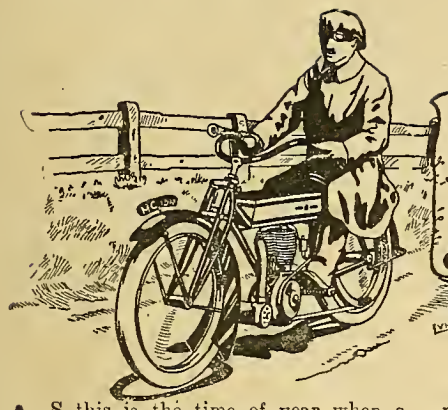
The first run will take place on the 24th inst. to Windsor. Other events will be announced later. All letters should be addressed to Mr. R. G. Barrett, 54, Florence Road, Stroud Green, N.



A long row of Bradbury riders in New Zealand. The photograph affords a striking instance of the popularity of British made motor cycles in our colonies.

WHY NOT? A T.T. Race for Motofrips.





BUYING SECOND-HAND MACHINES.

AS this is the time of year when a change of mount is most frequently made, it is naturally a time which more than any other sees a great many novices buying their first machine; and a word or two of guidance in the purchase of second-hand machines will, I hope, justify the space that they occupy. First of all, however, it must be argued, and, in fact, it often is, that the best thing a beginner can do is *not* to buy a second-hand machine at all, but a new one, as by that means he avoids all likelihood of coming in for troubles thrown upon him by the carelessness of his predecessor in the saddle. Those who uphold the "new machine" policy urge that there is no likelihood of its suffering serious damage, inasmuch as tumbles are more likely to take place when the machine is standing still than when it is running, and that anyhow, if it came to a case of running

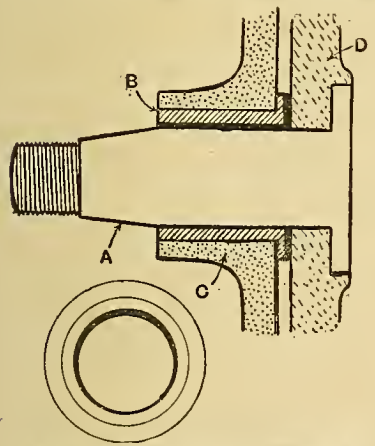


Fig. 1.—Showing how wear, indicated by solid black, develops in crankshaft plain bearings. The smaller section shows how a worn shaft lies in its bearing.

A, crankshaft
B, bush
C, crank case
D, flywheel

head on into a wall, the age or newness of the machine is not likely to be of much consequence; but the probability is that replacement of the damaged parts can be made just as effectively to a new machine, and also just as cheaply, as to the old one.

The same advocates sometimes go so far as to say that it is a real mistake to learn on a second hand machine because it may have an old type of carburetter, coil and accumulator ignition, and an automatic inlet valve, concerning all of which a lot of information will be gained which will be very little practical use when the rider graduates to an up-to-date machine. These arguments are all very well in their way except the last, which scarcely holds good, because the very great majority of machines on the second-hand market to-day are, as it were, "fitted with all modern conveniences," and differ only in detail from 1912 mounts.

Advantages in Purchasing a Second-hand Machine.

Personally, I strongly believe in the wisdom of learning to handle a motor cycle before throwing one's leg over £60 worth of spotless enamel and glittering nickel plate. The great advantage of obtaining intimate knowledge of a machine that has seen a good deal of wear is that one can perceive easily how such wear has been caused, where it takes place, and what steps can be taken to prevent it developing in a new machine. The latter will also suffer considerably by the constant undoing of those nuts and bolts which hide sources of information from the enquiring eye. The second-hand machine can, however, be handled with some impunity without suffering serious depreciation thereby.

It is not only novices at the game who are interested in second hand machines, for there are a great many motor cyclists who rarely, if ever, purchase a brand new mount, but remain, as it were, always a year or so behind the times, thus following their favourite hobby with perfect satisfaction and at a reduced cost.

Where to Look for Faults.

The following tips, based on many years of experience, may be of service to those who contemplate buying a second-hand machine. Points to which they should direct their special attention are as follow:

The engine is naturally the part which is examined first, and, although it is of vital importance, it certainly should not be allowed to overshadow other points, which, though not equally so, nevertheless require careful investigation. The first thing that one naturally goes for is the compression, which can be tested by turning the engine over by means of the belt pulley. If there is any doubt about the integrity of the seller, it may be worth while to ascertain whether there is any compression on *every* upward stroke. I know of a case where the compression of a 4½ h.p. De Dion voiturette consisted of a chair spring, but tricks of this nature are very unusual. However, it is always as well to be on the safe side. In testing compression, turn the pulley over as slowly as possible, as, if revolved sharply, the engine will show quite tolerable compression, even if the piston, rings, and valves are all badly worn. The next thing to look for is wear in the running parts. Alternately pulling and pushing the engine pulley from side to side will indicate lateral play in the main crankshaft bearing whilst shaking it in a vertical plane will give some idea of its journal wear (fig. 1). The same remarks apply to plain and ball bearings.

Wear on the big end of the connecting rod and the gudgeon pin can easily be detected by rocking the pulley very quickly backwards and forwards, and so reciprocating the piston up and down a very short stroke. Any shake that is in the bearings can thus not only be distinctly felt, but also, if listened for, heard as well. The practised hand can in fact quite easily detect at which bearing the play is developed.

The crankshaft should be tested for straightness, and this is easiest done by observing the pulley when the engine is being run on the stand. Bent shafts are by no means so uncommon as many people would imagine, and when they occur, even to a very slight extent, they are capable of giving more trouble than almost anything else.

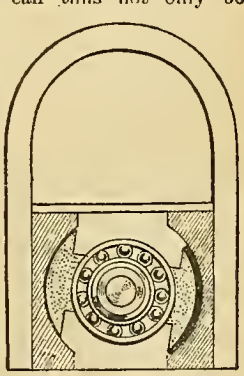

Fig. 2.—Sketch showing how wear in the armature bearings of a magneto affects the clearance (shown solid black) of the pole pieces.

Inspect the Timing Gear.

As regards the valve gear it is certainly desirable to have a look at the timing pinions. As this involves taking off the magneto sprocket, and possibly other things as well, it may not always be possible to do this, but if the gear can be seen so much the better. If not, the only thing to do is to ascertain that it gets, and has been getting, plenty of lubrication as if not the profile of the cams may have worn sufficiently to affect the power of the engine to an appreciable extent, and also back lash develops in the teeth of the pinions which serves to set up noise. Lateral wear of tappets and guides can easily be measured. Although this does not have much effect upon the power it makes a considerable amount of difference in the external

Buying Second-hand Machines.—

cleanness of the crank chamber, and as the proffered machine will be fairly sure to have been polished up assiduously this is generally the only guide as to whether the engine is clean or dirty in actual use.

If the tappets be not fitted with any means for adjustment the amount of clearance between the base of the valve stem and the tappet heads should be noted carefully. This should amount to about the thickness of an ordinary visiting card; if there be more, new tappets will be required.

Wear of the Magneto.

If a magneto be fitted this should be tested for wear by removing the chain or gear case and feeling for shake in the armature shaft (fig 2). Although magnetos are wonderfully well made as a rule, they are frequently neglected and wear is easily set up on the driving end of the armature spindle. Quite a small amount of slackness at this place will cause trouble and should be carefully looked for, as it is essential for the proper working of this mechanism that the armature should run perfectly centrally between the pole shoes of the magnets. The contact breaker platinums should be examined to see how much is left of them. The fibre foot of the rocking arm should also be inspected, as this will by no means last for ever. In like manner shake between the pin of this rocking arm and its fibre bushing should also be looked for. The bushes not infrequently swell and hold up the rocking arm, and the pin or fibre may have been reduced too much.

If the ignition be by coil and accumulator a test of the working of the former can easily be made by working the contact blade with one's fingers or by turning the engine round and holding the terminal of the high-tension cable about one eighth of an inch or so from some part of the engine. The condition of the accumulator terminals will show whether the battery has been well looked after, but it should also be carefully examined for signs of bent or broken plates, and for paste having become detached from the grids.

Carburetter Faults.

The principal things to look for in the carburetter are that it does not leak nor flood when the machine is standing still, and that the throttle and air slides work freely in their barrel. The only fault likely to be found in the petrol and oil tank is leakiness, and this should certainly be looked out for.

On the cycle part of the machine inspection should be directed towards the bearings on the front and back wheels, and also specially to the articulations of the spring forks and the tightness of the steering head. All these can easily be felt by shaking the wheels slightly from side to side with the machine jacked up on the stand, and in the case of the spring forks by holding the front wheel between the knees and pulling up the handle-bars with one's hands.

If the transmission is by belt the engine pulley should be examined for that "step" formation which is caused by belt slip and long continued use (fig. 3). If the pulley be adjustable the outer flange should be quite free from sideplay. The truth of the belt rim may also be investigated, and if it be clipped to the wheel spokes or fastened directly by short spokes to the tyre rim, any signs of the clips or spokes having loosened should be looked for.

Condition of Sprockets and Chains.

In chain transmission the condition of both sprockets and chains is important, and the way in which the chain rides on the sprockets when the engine is turned by pulling over the back wheel gives a good indication of whether they are at all out of pitch. If in good condition the rollers should go fairly and squarely down to the bottom of the gaps between the teeth, the sides of which, if polished very bright, will indicate that the user of the machine has been careless in aligning the back wheel after chain adjustment. It will be noticed, of course, that, although chain drive is extremely efficient, it is only so when the alignment and conditions of chains and sprockets are thoroughly good. If the chain be old and much used it may easily get so out of pitch as to make the transmission very inefficient indeed, and to get good results it will then be necessary to replace both chain and sprockets, an item of expense by no means negligible.

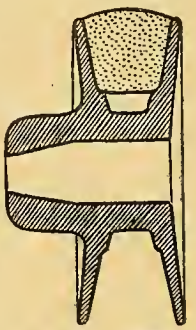

Fig. 3.—Showing how a "step" gets worn in the groove of a fixed pulley.

The condition of a bevel transmission is best obtained by jacking up the back wheel and feeling the back lash which has developed in the teeth. A small amount is unavoidable, but if there is sufficient to allow a point on the tyre of the back wheel to move through an arc of more than about two-thirds of an inch when turning the wheel with engine at rest, the wear is probably sufficient to demand a new pair of pinions, or at least to set up a good deal of noise.

Change speed gears in whatever position they be fitted require very careful inspection, but there are so many kinds in popular use to-day that it is impossible to do more than touch upon the general way in which possible faults should be looked for.

Clutch gears, or those in which the counter-shaft carries two driving chains, which may be coupled up one after the other to it, by means of clutches, generally show most signs of wear on the expanding clutch rings themselves, and upon the mechanism which is used to operate them. If, when the gear pedal or lever is forced right home, there is any tendency to slip, which is often the case after a season's wear, the difficulty can be met by fitting new operating bars. Ease of running of the gear can be tested by putting it into neutral position and pulling the back wheel over. Ill-use may have affected the expanding rings and prevented them showing a disposition to contract when out of engagement. A gear of this sort should run as freely as the pedal gear on a push bicycle, and if there is any noticeable friction it should be enquired into.

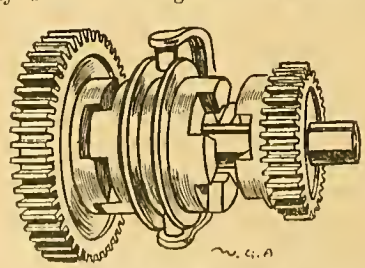

Fig. 4.—Sketch to show how, if the lever or pedal be badly adjusted, the dog clutches do not completely engage.

Positive counter-shaft gears should principally be examined for wear in the teeth of the pinions, which may easily be done by feeling the amount of back lash when turning the engine over by means of the back wheel. Undue noise from a gear of this sort, which can be thoroughly lubricated, is a sign of over wear. Ascertain that the high gear, low gear, and free engine positions of the quadrant lever or pedal correspond with the position of the dog clutches in the gear box, and that these clutches are fully engaged with one another when the lever is in its respective notches (fig. 4). If the operating lever can be pushed beyond these notches in both directions the probability is that the gear has been brutally used and the dog clutches become badly worn. Wear in the bearings of the primary gearshaft can easily be felt by shaking both the driving and driven parts of it.

Hub Gears.

As these are of the epicyclic type, points to look for are absence of friction in the free engine and top gear positions, back lash between the belt rim and the road wheel caused by wear on the teeth of the internal pinions, and the condition of the brake bands. The latter may have had all their adjustment used up, in which case they will require their linings replaced. Back lash can best be felt by holding the tyre with one hand whilst moving the belt rim with the other. Lash, in some gears, even when new, is rather a large amount, owing to the number of trains of pinions through which the drive is transmitted. On a two-speed gear, however, movement of a 19in. belt rim should not be greater than an arc of about an inch. Ascertain that the gears are firmly and positively engaged when the lever or pedal is operated, and that in mid-positions there is no grating as if both gears were trying to engage at once.

Free running of the multiple surface metal-to-metal clutches, which are used both in hub gears and hub clutches, should be ascertained by spinning the back wheel, or attempting to do so when the clutch is disengaged. Holding the belt rim and pulling on the tyre will go some way towards showing if there is any likelihood of slip taking place.

The same remarks apply to gears and clutches intended for application to the engine-shaft. In all cases, the points to be looked for are wear on the gearshaft bearings and back lash in the teeth of the pinions.

When it comes to examining tyres, the prospective buyer is, one must admit, treading on rather difficult ground,

"Distinct from all Others."

HUTCHINSON RUBBER STUDDED

The Hutchinson Rubber Studded covers have set the fashion to the tyre world. Already a crowd of successes in all competitions stand to their credit. They possess an extra heavy tread, and the manner in which the studs are arranged makes skidding practically an impossibility. Without exception they are the finest value that has ever been placed on the market.

Buying Second-hand Machines.—

because a cover may look good for quite a long distance ten minutes before it gives up the ghost altogether. The feel of the rubber and its appearance should, however, give one a fairly good idea of its quality. If the cover is old it will probably have a number of minute cracks lying between the bead and the tread. The latter should, of course, be examined for cuts and gashes, especially those which are more than superficial and go in sufficiently far to let water get into the fabric. As a matter of fact, tyres can only be properly examined if looked at both from the outside and from the inside. As an examination of the inner tubes and inside of covers means removing the tyres from the rim, which is inclined to cause some little trouble, they will probably have to be taken on trust.

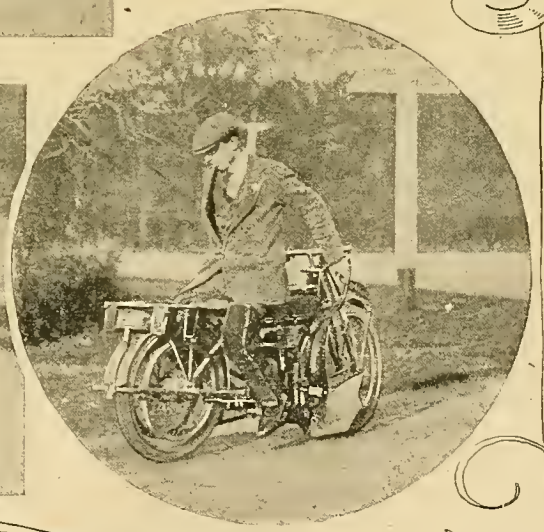
An Exhibition Run.

Accessories may be assayed more or less at a glance, but it is quite worth while to ask to have the head lamp lighted so as to prove both it and the generator at the same time. A speedometer is certainly reliable, but will not stand abuse. If out of condition it will show its three principal faults quite clearly, viz., shakiness of the indicating hand, noise, and stiffness. Spinning the front wheel for a few moments will give a tolerably good idea of its working. The condition of the driven pinion is worth passing attention. This will not by any means last for ever, especially as it is rarely set properly in pitch.

It is not every seller of a motor cycle who will allow the prospective purchaser a solo run on the road. If there is no sidecar, a short run on the carrier is likely to be as informative as to the general behaviour of the machine as anything. Failing this, the seller should be asked to give an exhibition which should include as stiff a hill as possible, and a burst of speed on the level. In the former case, get the rider to climb the hill as slowly as possible. This will bring out clearly any knock that the engine possesses, much better, in fact, than a rush up the hill would. After this, ask for an exhibition of fast climbing. In the matter of speed the buyer is the best judge of what he himself requires, but it is as well to keep as sharp an ear as possible for the rattle that worn parts always set up. A demonstration of slow running on the level should be asked for, as in many ways it is an even more seaching test than a speed burst.

In purchasing a second-hand sidecar, appearance may be taken as the best guide as to value. Don't forget, however, to look for end play in the sidecar wheel bearing, and for signs of "give" in the stub axle and frame. Viewed from behind, the sidecar wheel should be exactly vertical and parallel to the rear wheel of the motor cycle. Any tendency for the two wheels to converge upwards may be taken as a clear proof of weakness in the sidecar axle or bad alignment of sidecar and motor cycle. The alignment of the springs is worth a glance, as in the cheaper sidecars their temper is often rather an indefinite quantity, and if they are on the dead side they nearly always manifest a tendency to sag sideways. Play in the spring shackles is of very little moment, provided wear has not taken place to such an extent as seriously to weaken their strength and that of the pins on which they turn.

Assistance of an Expert Friend.

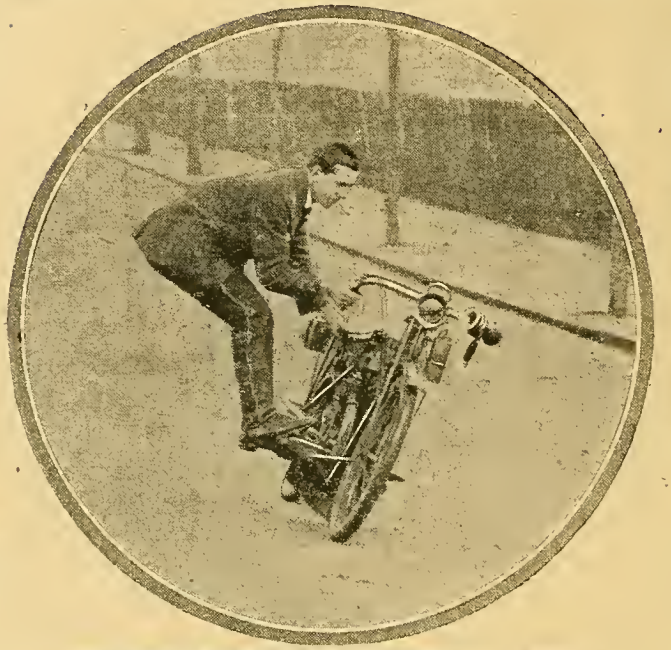


Finally, if you have any doubt about your ability to judge between a good machine and a worthless one, get your most expert motor cycling friend to go with you, but do not hesitate to use your own eyes and ears as well as his. If you are a "lone hand," do not pretend to more knowledge than you have got. The man who, not being one, poses as an expert is obviously lacking in commonsense, and, as such, is more easily taken in by a shrewd seller.

Lastly as to payment. Don't trust a total stranger, and don't expect him to trust you. Make use of *The Motor Cycle* deposit system, and think twice or three times about a seller who demurs at your suggesting it, but if both parties are decided that they can do without it, don't offer your cheque by way of payment and feel insulted if it be refused. If you have the cash in the bank you can get it out just as easily as anyone else and go prepared to purchase with the cash in your pocket, which saves any amount of misunderstanding. W.G.A.

TRICK RIDING ON A MOTOR CYCLE
(see next page).

(1) The above change of position might appeal to long distance riders who get cramped.



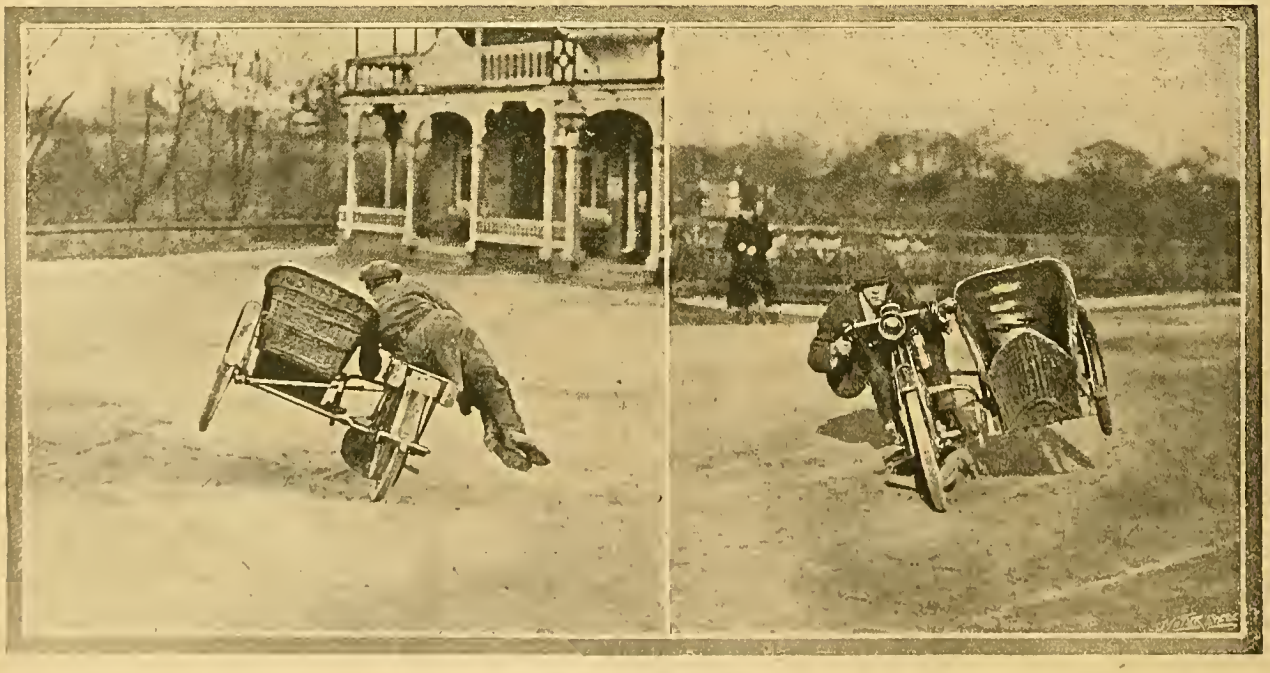
(2) To lessen wind resistance—and a useful position for a military scout.

(3) Riding backwards with the engine actually running.

The clever motor cyclist depicted is A. Milner, of Birmingham, whose mount is a 3½ h.p. three-speed James.

TRICK RIDING ON A MOTOR CYCLE.

THE accompanying illustrations show a few methods of riding a motor cycle which are, fortunately, rather unusual, and while the ordinary, common, or wayside motor cyclist may admire, he will not be likely to wish to imitate, for while they are interesting as showing what can be done by a skilled performer, we do not think they serve any useful purpose, or that they are desirable on the public roads. Mr. A. Milner, the rider, has been a trick cyclist on the stage, and a member of the Olympian Troupe, which at one time toured the music halls. He commenced trick riding as a boy, when he often incurred his father's anger by collecting crowds outside his place of business, and was deservedly corrected in the orthodox manner.



A daring position which should dispel any supposition that a motor cycle is difficult to ride.

Mr. Milner's first mount was a bone-shaker which once belonged to his father, his second a pneumatic-tyred safety. It was upon the latter that, stirred to emulation by some trick-riding which he saw on the stage, he first set about practising for himself; but previous to this he had learnt to ride on the driving wheel only of an old high bicycle, for which he gave the large sum of half-a-crown, the backbone of this machine having got broken.

Mr. Milner created something of a sensation at the Sutton Coldfield Trial, recently held from Birmingham to Banbury and back, by running alongside his mount and springing on to the saddle with his feet, when another man would be content to sit, but we do not think he rode down Sunrising in that way.

Mr. Milner has been the possessor of thirty-three motor cycles, and he speaks very highly of his present mount, a 3½ h.p. James, fitted with the Armstrong three-speed hub. This machine will fire steadily while Mr. Milner goes through the performances shown and cuts figures of eight and circles while at the same time climbing over his machine. He has had one narrow escape of an accident. On this occasion he was trying to stand on his head, slipped, and caught his shoulder on the saddle. Just at this moment a runaway horse appeared and a collision was narrowly avoided. "All's well that ends well."

JUGGLING WITH A RIGID SIDECAR.

(1) One way of taking a corner. (2) The sidecar as an aid to balance. The rider really assumes a greater angle than this, the footrests practically touching the ground once or twice, but not within the range of the camera lens.

Ride with an easy mind!

YOU CAN, IF YOU HOLD THE

This Spring choose a Spring frame

BEST AFTER BAT TESTS

The "BAT" Spring Frame has stood the test of time. It was the first and is the only frame sprung both fore and aft which has been so tested. Minor improvements have been effected as the evolution of the motor cycle advanced, so that now the "BAT" SPRING FRAME is absolutely the last word in shock-absorbing devices as applied to motor cycles. It is eloquent of the difficulty that manufacturers have experienced in designing a really practical spring rear frame that nothing has yet been produced to seriously rival the "BAT" for giving the maximum comfort to the rider with the maximum of efficiency in the machine itself.

As the "BAT" makes motor cycling comfortable to the young and the less young in a manner in which no other can do—as it absorbs all road shocks and interposes a buffer between them and the rider as well as the vital parts of the motor—

IT MUST PROVE THE BEST INVESTMENT FOR 1912.

The Improved "BAT" Spring Frame for the 1912 Models.

The Catalogue explains fully. Write for it.

THE BAT MOTOR MFG. CO. PENGE, LONDON, S.E.

Camping and the Motor Cycle

By J.S.F.

HAVING read various descriptions from time to time in *The Motor Cycle* of motor cycle camping holidays, it has occurred to me that it would be of general interest to give my experience of the pastime, and describe how to set about acquiring a suitable outfit from the purely motor cyclist point of view.

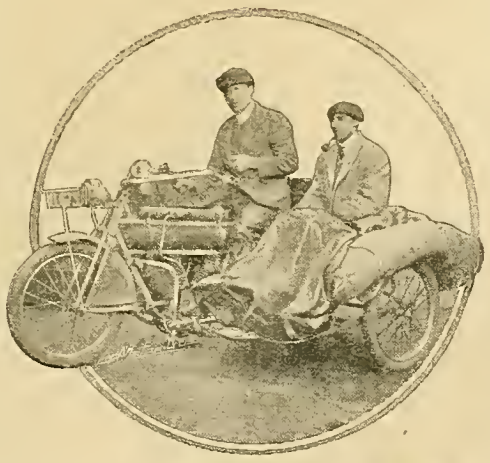
I have only taken up camping in conjunction with motor cycling during the last year, but the fact that I have had a very large experience of this method of spending a holiday—alike by walking, boating, yachting, in permanent camps, and with and without tents in various parts of the world—may make my opinion of some value.

So far as my present readers are concerned, I need only give details to meet the requirements of a motor cyclist, but my former experiences have helped me very much in getting together an equipment which for compactness, lightness, and convenience will take a lot of beating. This outfit has been evolved rather than designed, and each trip provides me with fresh ideas.

In the first place, my machine (with which, on these trips, I use a sidecar whether I have a companion or not) is a 7 h.p. fixed engine Speke and Ramsden. As this make is not now on the market, I shall not be accused of axe grinding when I say I would not part with my machine for quite a lot. In spite of having considerable power at my disposal, I recognised at the start that the most important problem was to reduce weight as much as possible.

Weight Reduction.

The tent was the first item for consideration, and I ultimately decided on a Canadian type, with jointed poles, weighing 9 lbs. This tent is not uncomfortable for even three to sleep in, and has amply sufficient capacity for two. Cooking gear came next, and I at first used an acetylene stove. The troubles with this, however, such as giving out in the middle of preparing a meal, water choking the burner jet, etc., were so numerous that I discarded it after three trips for a pocket Primus outfit weighing 2 lbs. This I found eminently satisfactory, and I can stew a rabbit on it in a way that would make a "chef" of the "Ritz" envious—although "I ses it as hadn't ought."



For pans I obtained a set of four in aluminium weighing 12 ozs. Two of these are stewing and two frying pans, the latter forming lids for the former, and there is one handle common to the lot. For packing they all nest into the largest. For water I used the usual canvas bucket.

Next comes bedding. For my part, I have much faith in personal comfort, and object to sleeping on the "hard" when it can be avoided. I therefore make use of a regulation army palliasse and pillow, which I fill with hay at the nearest farm. This has advantages and disadvantages. The first consist of more comfort and no necessity for blankets under one, therefore less weight to carry. The latter—if one arrives late on the ground, or a farm is not near, hay may be difficult to obtain, and also the hay has to be returned or disposed of in some way so as not to leave the ground in an unsightly condition. Besides these, I carry a ground sheet and three blankets. If I have a companion the allowance of palliasses and pillows is doubled, and an extra blanket has to be carried. The total weight of bedding for myself and companion is 30 lbs. This can be reduced very considerably by using eiderdowns instead of blankets, but as I have not yet tried these I cannot speak for them.

The Charm of a Nomad's Life.

One of the essential charms of a nomad holiday is to be able to pitch camp at any place which takes one's fancy, and without pre-arrangement. This may be ten miles from or actually in a village. It is necessary, therefore, to carry supplies of food, which should always be kept up to a certain minimum by replenishing *en route*.

For my part, I take 2 lbs. sliced bacon, 1 lb. castor sugar, ¼lb. tea, 1 lb. oatmeal, one tin condensed milk, salt, and 1 lb. beef dripping. To insulate these comestibles from vibration puzzled me a good deal at first, but I overcame the difficulty by using canvas bags for the bacon, tea, and oatmeal, and lever lid tins for the milk and dripping. I have recently attached a basket to the back of the sidecar. This I have found a great advantage, as in it can be placed a loaf of bread, fresh meat, butter, etc., without unpacking the larger kit. If I am absolutely vague as to the destination, I pick up these articles as I go along and early in the day, but, as a rule, one knows fairly well where one intends to stop, and then the provender is collected in the last village.

J.S.F. and his motor cycle and sidecar loaded with camping kit.

The enthusiastic camper does not confine his hobby to the summer months.

This may sound a lot of paraphernalia to carry about on a motor cycle, but it is wonderful into how small a compass it can be packed. The means of disposing it depend on the accommodation available, and this must vary.

My tent rolls up into a bundle 12 inches by 5 inches, and packs, together with cooking gear, food supplies, plates, knives, cups, bucket, etc., into an old suit case which happens to fit the space between the sidecar seat and the frame. The tent poles (in three pieces each about 2ft. long) are strapped with fishing rod to the sidecar axle and front stay.

The rugs and bedding (which are the most cumbersome items) are rolled in a canvas, which forms a cover for the motor bicycle, and is strapped to the sidecar above the mudguard. This leaves my carrier on the motor free for a case containing night wear and a change of garments in case of a wetting. As I remarked before, I believe in comfort, and I therefore sleep in pyjamas. *Verb. sap.*

Total Weight Carried 85 lbs.

The total weight of the equipment for two people works out as follows: Suit case mentioned, 28 lbs.; bedding, etc., 30 lbs.; poles, 2 lbs.; personal clothing, 25 lbs.; total, 85 lbs.

Besides the items mentioned above, there are numerous odds and ends which make for happiness. About 20 to 30 yards of good light cord enable one to dry bedding, etc., even if the ground be wet. It is a good plan to use the motor cycle gas generator for illuminating the tent. If it be advisable to remain two days or more in any one place, it pays to obtain a soap box to use as a store cupboard and table.

A Holiday Under Canvas.

Pitch camp as near a stream as possible—it makes washing, both personal and otherwise, easier. See that drinking water is reasonably accessible. Carry a small rifle; it is often possible to obtain permission to shoot rabbits, which not only helps the pot but adds to the sport of the outing. Fix on the outside of the equipment case a list of the essentials it should contain. Always check these after packing and before starting; anything forgotten means expense or discomfort, or both. Never pitch camp directly under trees, as no tent which can be conveniently carried on a motor cycle will withstand the large drops falling from trees during a heavy downpour of rain, the result being a fine spray which falls over all the occupants of the tent and soon causes great inconvenience. A description of a typical outing may be of interest.

A contrast—the camp in summer.

Bowdenism

(The science of simple control.)

Invaluable Advice.

If your controls are wrong you are bound to be in trouble. Therefore, before starting the 1912 season, give them a thorough overhauling.

¶ See that the control levers are working freely, but yet remain fixed in any desired position. Examine your brakes carefully.

¶ See that the wire mechanism is in good condition. Take up any slack in the inner wire by screwing out the adjustable stop. (An invaluable spare which permits the replacement of broken wires on the road without soldering is the Bowden Adjustable Wire Coupling. You **must** carry one. Price complete 1/3)

¶ Do not start the season without Handlebar Magneto Control. Both your hands are available for steering, and the levers will not jolt from the required position. Complete, 8/6 to 11/6.

¶ You know the value of Extra Air as an engine cooler, a petrol economiser, and a brake. The Bowden Extra Air Inlet fits to the induction pipe without soldering, and shuts right down when not required. Prices, 11/- to 13/-.

¶ If you have inverted levers a Hold-up Clip to release compression will save you a lot of trouble. Prices, 3d. and 6d.

¶ A few Spring Steel Clips (to hold one, two, or three wires) will keep your wires neatly in position. 1d. each.

What about a Bottom Bracket Gear, designed to fit existing machines of approximately 3½ h.p.?

Camping and the Motor Cycle.—

A complete camping outfit by Messrs. John Piggott, Ltd. It includes tent for two people; weight about 5 lbs., 7ft. 6in. x 4ft. x 4ft. 4in. high, waterproof ground sheet, sleeping bag, Balaklava helmet, nest of aluminium saucepans, frying-pan, and Primus stove. The long rolled up package represents the tent complete, stowed away. The tent is held normally by pegs shown at the entrance.

In my case, the bicycle and camping are merely incidental to fishing—a means to an end—but the procedure is the same when camping is "it."

One day last year I started from Leeds at about noon for a stream in Cumberland, about forty miles west of Newcastle-on-Tyne. The distance is about 130 miles *via* Newcastle, where I had arranged to pick up a friend. This friend failed me so far as the holiday was concerned, but persuaded me to stay the night with him. I reached my destination at about 10.30 the following morning, having picked up steak, vegetables, eggs, bread, etc., at the last village—five miles from my pitch. With leave from my farmer—three miles beyond the pitch—I harked back and fixed up the tent, got out the cooking gear and arranged the larder. I then made my first mistake, for which I paid later on.

A Day's Fishing.

Instead of going to the farm again and filling the bedding with hay, I started in at once after the elusive trout. Getting back to camp at about two o'clock, I cooked three trout and had lunch. After a smoke I washed the dishes and repeated my former mistake. I fished till about 6 p.m., and, considering the state of the water, did fairly well, creeling nine. I then cooked supper and got things ready for turning in. At this time I was cooking with acetylene, and the process took at least twice as long as it should do, and now does.

I turned in about 9 p.m., and slept fairly well at first, but towards morning I began to find the ground harder and harder, and at 5.30 I was cooking porridge. After absorbing this I fished for about an hour, bathed, had a good breakfast of bacon and eggs, and made sure of a comfortable night by gathering hay at the farm. Having aired the bedding and made all snug, I went for a run of about fifteen miles to see a waterfall, which was a disappointment owing to the scarcity of rain.

Visitors to my Camp.

I intended fishing after dinner (stewed steak with plenty of vegetables), but, in spite of being five miles from the nearest village and only one house within three miles, I had so many visitors that I did not get on the water until the evening. My visitors were much interested in the equipment, but did not appear to credit my statement when I explained that it could all be carried quite comfortably on the motor cycle. The idea of anyone being content to camp out in the wilds absolutely solus seemed beyond them. I slept so comfortably that night that I felt quite ashamed of myself on waking up and finding it was 8 a.m. After a pleasant day's fishing (not much sport, but hot and comfortable), I packed up, burnt all rubbish, and started homeward at six o'clock. I camped that night alongside a convenient haystack south of Durham, and reached Leeds about eleven o'clock on the Tuesday.

And so to work.

As described, the proceedings may read tame, but the writer knows his limitations, and funks attempting to describe the attendant charms. A man with even less of a poetic temperament but a great deal more command of language would be able to write in glowing terms of the feelings of fitness and virtue consequent on early rising, fresh air, and the morning dip. He would probably further enlarge upon the sense of freedom due to absence of the conventions, the glorious vistas of sylvan and river scenery on opening the tent door at sunrise, the gorgeous appetite enhanced by spending day and night in the open and the odours from the pan, and the pioneer feeling of discovering new country.

Eddie Hasha (7 h.p. 8-valve Indian). The photograph was taken on the new three-lap track at Los Angeles, where Hasha recently set up new records. The ride is standing on the portion of the track from which the men get a start before ascending the 50° banking, which is easily discernible in the picture.

Questions & Replies

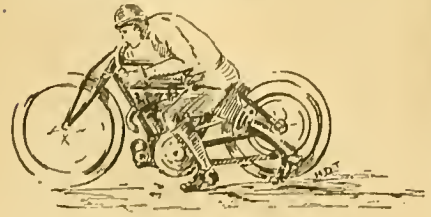
A selection of questions of general interest received from readers and our replies thereto. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal queries should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Inland Revenue Licence.

Q. A and B, having paid the £1 revenue tax for 1912, exchange motor bicycles, and transfer the numbers from one to the other in legal form. Can each be legally compelled again to pay the £1 tax in the same year, having only one machine in his possession?—A.A.S.

There is no need to take out a fresh local taxation licence. The £1 tax enables the one who takes it out to keep one motor bicycle at a time; it does not matter how often he changes his mount.

Hill-climbing with a Sidecar.



Q. I have a 1911 Scott and intend to use it with a sidecar. Would the machine pull a Canoelet sidecar well? That is to say take sidecar and passenger up Fitzjohn's Avenue or Netherhall Gardens.—B.T.

The machine in question would take a sidecar quite well and would negotiate Fitzjohn's Avenue with the greatest ease, but it might have a little difficulty with Netherhall Gardens. It would be advisable to write to the makers and ask if the gear fitted is sufficiently low to take a gradient of 1 in 7.1, which is the officially surveyed gradient of the last mentioned hill.

Magneto Cut-out.

Q. The new Bosch magneto has no terminal for a magneto cut-out. I propose to attach wire of cut-out to the h.t. terminal of plug. Presuming this will act all right, is it likely to do any damage to the magneto or cause misfiring?—W.M.

If you write to the Bosch Co. they will supply you with a contact breaker cover on which a terminal for the magneto switch is fitted. This would be rather better than attaching your switch wire to the plug terminal, the result of which would probably be to get a spark jumping from the earth terminal to the switch through the handle-bar when the switch was in the "off" position.

Pictures without Words. No. 1.

The Scott as a Weight-carrier.

Q. I am considering buying a 1912 Scott motor cycle, and I should be very much obliged if you will answer me the following questions: Has the Scott more troubles than a four-stroke motor cycle? What gradient does the Scott climb with a rider weighing about 220 lbs. and loaded with luggage for a long run.—M.C.D. (Koddaba, Egypt).

The machine you refer to in your letter is an excellent one, and we have no hesitation in recommending it. We do not think you would have more trouble than with a four-cycle engine. The machine would climb a hill of 1 in 5, or even worse, with this load without difficulty, and with the standard gear.

Timing Exhaust Valve.

Q. Will you be good enough to tell me the exact position of the piston in the cylinder when the exhaust valve commences to open?—H.F.

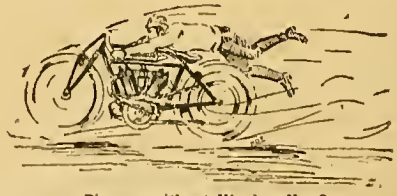
What you should aim at is to ensure the valve closing at the right point, which is, in most cases, when the piston is at the top of the exhaust stroke, or just after. If you set the valve to close dead at this point you can turn the engine back; note when the valve has begun to open, insert a spoke in the cylinder and this will tell you how far down the piston is when the valve begins to open. It should be about one seventh of the length of the stroke from the bottom, *i.e.*, when the flywheels have revolved through 135°.

Sunderland to Southampton.

Q. What should be the exact power of a motor cycle with 72 mm. bore and 75 mm. stroke? Which is the best motor cycle route from Sunderland to Southampton to avoid all big towns? How long would it take to travel with the motor in question?—R.M.

If the engine is a modern one it should develop nearly 3 h.p. The exact power we cannot give; this could only be obtained from a brake test. Your best route would be as follows: Sunderland, Durham, Darlington, Northallerton, Boroughbridge, Wetherby, Ferrybridge, Doncaster, Retford, Tuxford, Newark, Grantham, Stamford, Kettering, Northampton, Towcester, Brackley, Oxford, Abingdon, East Ilsley, Newbury, Whitchurch, Winchester, to Southampton. It would take you two days to cover the journey comfortably.

Registration and Licence.



Q. I have an 8 h.p. Rexette tricar. What licences am I supposed to take out for it, and is it registered as a motor cycle? Is weight taken into consideration on a three-wheeler?—R.A.M.

You will have to pay £1 local taxation licence, but must register as a motor car, which also costs £1. The fact that it is over 3 cwt renders it a motor car as regards registration, but the fact that it has not more than three wheels renders it a motor cycle as regards local taxation licence.

A Magneto Query.

Q. About last October I had trouble with the magneto rocking arm of my twin sticking and followed your advice to readers in previous issues to increase slightly the size of the hole in the fibre bush in which the stud of the rocking arm fits, also to clean the stud. The machine has been stored during the weather in a dry shed, and I find, on examination, that the rocking arm is again immovable, in fact it sticks so badly that firm pressure with the fingers will not move it. Can you suggest a remedy to prevent this occurring again? It appears to me that the slightest dampness must affect the fibre bush to a considerable extent.—X.Y.Z.

In more obstinate cases the cure is to take a taper three cornered tool, such as the tang of a small file, and gently ease the hole in the fibre, inserting the file-tang on both sides. With the spring of the rocking arm or bell crank disconnected the arm should be sufficiently free to fall by its own weight. If it will not do this, the hole must be eased till it does A better method would be to obtain a small reamer a fraction larger than the stud on the arm and pass it through the hole. Sticking of the arm is about the only thing that ever causes trouble with a magneto.

Pictures without Words. No. 2.

Cold Vulcanising.

Q. Could you give me any particulars of cold vulcanising? I have tried two patches on a red inner tube, and I don't think them a success. After three days I can pull patch off; it is not so secure as an ordinary patch. Do you think a tread can be fitted in this way to be a success?—SOLUTION.

A process of cold vulcanising at present in use is called the Ara. A small outfit costs 25s., and it is quite satisfactory. Although the instructions read somewhat complicated, the work is quite simple. The great thing is to put everything out ready in order before commencing, and with a watch handy on the table the times for vulcanisation can be properly adhered to. The address of the firm which supplies the outfit is Ara, Ltd., 100, Long Acre, W.C.

A Twin for Sidecar and Solo Work.

Q. Can you tell me if the 6 h.p. Enfield sidecar motor cycle is: (1.) A thoroughly reliable combination? (2.) An expensive machine in upkeep? (3.) If the motor cycle is a satisfactory mount for solo work? (4.) If too heavy for solo work, would you recommend me some machines which would better suit me for solo and sidecar work? My passenger and I weigh together 25 stones, and I should occasionally want to take luggage as in touring. I fear a belt drive for sidecar work. I would probably do more solo than sidecar driving, yet if I had to make my choice would rather have a machine a little unwieldy for solo riding than one under-powered for sidecar work. Can I hit off the happy mean?—F.R.L.

(1.) The machine is thoroughly reliable. (2.) It is not expensive to keep up. (3.) It will be quite satisfactory as a solo mount, and not heavier than other powerful twins. (4.) As far as we can gather from your letter, we think it would suit your purpose admirably.

Darlington to Pwllheli.

Q. Please tell me the best route to take between Darlington and Pwllheli (N. Wales). I have done this ride a few times and have always gone *viâ* Wetherby, Leeds, Huddersfield, Oldham, Manchester, Altrincham, Chester, Conway, etc.—J 355.

We should recommend the following route: Darlington, Scotch Corner, down Leeming Lane, towards the end of which you branch off to Ripon, go through Ripley; before reaching Harrogate go through Blubberhouses, Skipton, Gisburn, Clitheroe, Whalley, Preston, Ormskirk, and Liverpool, cross by ferry to Birkenhead, go through Chester and Rossett, where turn left for the road joining the Holyhead Road near Corwen, then branch off for Bala and go through Festiniog to Pwllheli, or, if you prefer it, go *viâ* Conway. The distance is nearly 220 miles. Your old route contains far too many towns to suit the average rider. Another alternative is to go through Wetherby and straight down the Great North Road as far as Doncaster, then go through Tickhill, Worksop, Chesterfield, Baslow, Bakewell, Buxton, Congleton and Northwich, to Chester.

EXPERIENCES WANTED.

Readers desirous of obtaining the experiences of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries below should be addressed c/o The Editor.

"Southern" (Lewisham).—Albion and Roc gears with sidecar.

"R.B." (Andover).—3½ h.p. Ivy-Precision with and without three-speed gear and free engine.

"E.L.L." (Basingstoke).—Mabon variable gear on 3½ h.p. Triumph and sidecar.

"W.S.W." (Lowestoft).—Bowden and Mabon gears on 3½ h.p. standard Bradbury.

"R.F." (Banbury).—Binks carburetter, Rom tyres, Lomax band, Atlas inner case, and Morgan Runabout.

"L.D." (Godalming).—4 h.p. Rex de Luxe.

"H.J.C." (Wimbledon).—Morgan Runabout, with regards reliability and running costs.

"A.M.H." (Hinckley).—3½ h.p. two-speed Alldays and sidecar, also G.W.K. cyclecar.

"J.O." (Edgbaston).—3½ h.p. 1911 Zenith-Gradua with sidecar.

"G.D.M." (Moneymore).—4½ h.p. Excelsior, with Villier clutch and sidecar.

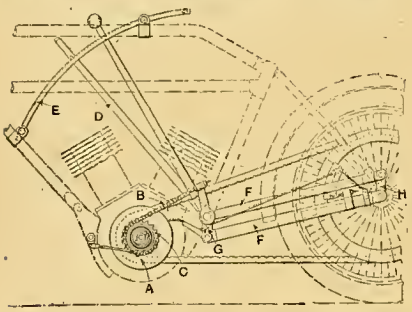
"F N" (Southampton).—1908 or 1909 four-cylinder F.N.; reliability and speed over long distances.

"F R.L." (Roscrea).—3½ h.p. and 6 h.p. Zenith-Graduas. 3½ h.p. two-speed Bradbury, and 6 h.p. Enfield with and without sidecar.

CLIMBING RED BANK, GRASMERE.

A gradient steeper than Honiste[r] Pass, but of good surface. The motor cyclists are F. Smith (5-6 h.p. Clyno sidecar) and W. B. Little (3½ h.p. Rudge).

An Improved Chain Belt.



This chain belt comprises a series of built-up links A connected by hooks B. The links A comprise side plates C D, formed of sheet metal and bent over to receive leather or other friction pads E.

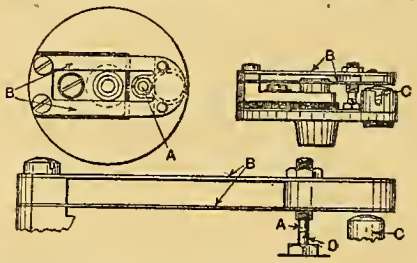
The plates C D are connected by rivets F, the two upper of which are engaged by the hooks B.—H. S Yoxall and C. W. Thorneycroft, No. 2,538, 1911.

The Matchless Variable Gear.

A variable pulley having a movable flange A is used, the flange being operated by a chain B passing round a sprocket C

and connected to a lever system D, working in a quadrant E. With this pulley is employed a belt tensioning device which comprises duplicated frame members F

PATENTS

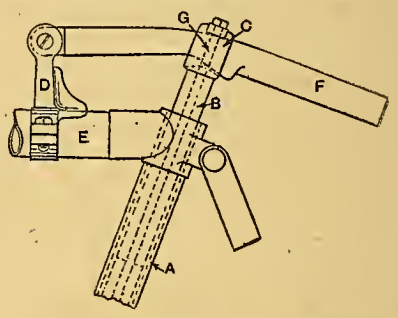


BY

ERIC W WALFORD, F.C.I.P.A.

connected together by depending links G H. The rear wheel is carried at the lower end of the link H, and the link G is extended on the opposite side of its pivot to form a hand lever, also working in the quadrant E. By operation of the lever D, the lower stay is moved in relation to the upper, providing an adjustment for the belt.—H. A. and C. R. Collier, No. 6,857, 1911.

A New Bosch Contact Breaker for High Speed Engines.



At high engine speeds the ordinary contact-breaker blade may work erratically

owing to the centrifugal action. In this case the blade moves endwise, the movable contact A being mounted on a pair of spring arms B which run parallel with one another, and is moved endwise by means of a button C which is actuated by a cam. As the blades are parallel the movable platinum contact A travels towards or away from the fixed platinum contact D in a straight line, so that arcing when the contacts senarate is prevented.—R. Bosch, No. 29,678, 1911.

A Spring Seat-pillar.

Working in the frame tube A is a spring seat-pillar tube B, the upper end of which is forked at C. A bracket D is clipped to the top tube E, and pivoted to this is the seat arm F, which is adapted to fit in the forked end C of the tube B, and carry the

saddle at any suitable point. The stem F is slotted for the passage of a rod G, which operates the adjustable spring mechanism of the tube B. The exact construction of this latter feature of the device forms the subject of an earlier patent, No. 19,991, 1909.—J. Smith, No. 29,069, 1911.

Lubricating Oils.

We are informed that the use of Sternol A. oil is gradually, but surely, increasing among motor cyclists.

The Easter Demand.

Excelsior motor cycles are in great request this year, and the makers, Messrs. Bayliss, Thomas and Co., Coventry, inform us that the demand has greatly exceeded their expectations.

A Tyre Guarantee.

Messrs. John Piggott and Co., who are marketing the J.P. rubber-studded cover illustrated on the 22nd ult., are issuing a printed guarantee with each cover with conditions as to measuring distance, horse-power to be used, and weight to be carried to which the guarantee applies. Readers who contemplate purchasing these covers can obtain copies of the guarantee on application to 117, Cheapside, E.C.

Catalogues Received.

The catalogue of Messrs. Gough and Co., Park Road, Hockley, Birmingham, is used to illustrate and describe motor cycle saddles in many forms, various types of tool-bags, spare belt carriers, and telescopic luggage carriers.

The latest catalogue of Gloria sidecars, the excellent springs and neat attachment of which created great interest at the last Show, is to hand. Applications for copies should be made to the Gloria Cycle Co., Ltd., Coventry.

A leaflet describing the 3¾ h.p. Sun-Precision motor bicycle. This machine follows standard lines throughout, and is made by the Sun Cycle and Fittings Co., Ltd., Birmingham.

Acetylene Gas Tubing.

A sample of acetylene gas tubing has reached us from Mr. J. Atkinson, Rubber Works, Summer Row, Birmingham. This tubing has a canvas insertion between the layers of rubber, which makes it impossible to burst the tubing, and gives it very much increased life. The thickened ends are carried for some distance along the tube which it is claimed prevents cracking.

Equipment.

The following description of the accessories used by the machines which were successful in climbing Honister Pass on the 9th inst. may be of interest:

Frank Smith's Clyno had Palmer tyres, B. and B. carburetter, and Bosch magneto. He used Price's Huile de Luxe.

Hugh Gibson's Bradbury had B. and B. carburetter, Bosch magneto, and Clincher tyres. The engine was lubricated with Wakefield Castrol.

Bert Haddock's A.J.S. had Hutchinson tyres, Amac carburetter, and U.H. magneto.

Vernon Taylor's Rudge had Lyso belt, Hutchinson tyres, Senspray carburetter, and Eisemann magneto. He used Wakefield Castrol.

A Weighty Catalogue.

Fifteen tons of paper were, we understand, used to print the new edition of Gamage's Motor List, which is just published.

Tyre Reliability.

One of the John Bull cross grooved covers illustrated on page 262, March 7th, was incorrectly described. The one on the right was a new cover, the one on the left having covered 12,000 miles.

An Effective Road Clearer.

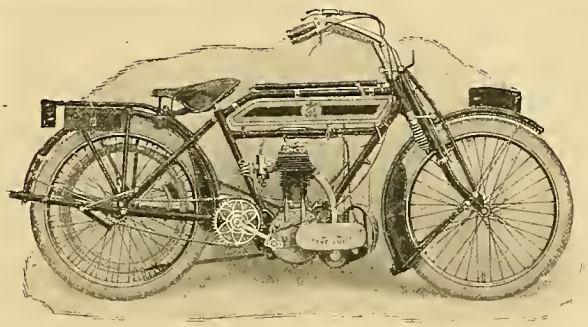
Messrs. Seabrook Bros., 57, Great Eastern Street, E.C., have lately introduced a bell with revolving gongs. It is very loud in tone, and should be an effective road clearer which is not offensive to the general public.

Wulfrunas in London.

Harrods, Ltd., Brompton Road, S.W., have a sample of the Wulfruna motor cycle fitted with Thornton two-speed gear, in their showroom, and will be pleased to demonstrate the machine and the gear to interested readers.

Trade Announcements.

On November 16th, last year, we published a photograph of a G.N. Runabout with its owner, Mr. Cecil Whitehead, at the wheel. Mr. Whitehead has now decided, owing to the interest taken in the publication of this illustration, to join the firm of Godfrey and Nash, the makers of the G.N. Runabout. We are asked to publish this information, as Messrs. Godfrey and Nash think it is possible readers might be under the impression that Mr. Whitehead's appreciation was not disinterested at the time.



"Sun" Precision Motor Cycles

The SUN is winning golden opinions everywhere.

Simplicity is its keynote from start to finish, and our 25 years' ripe experience as one of the largest firms in the Cycle and Motor Cycle Trade ensures the workmanship being as near perfection as possible.

SPECIFICATION.

Precision 3¾ h.p. Engine, B. & B. or A.M.A.C. Carburetter, Bosch Magneto, Dunlop Tyres and Belt, Druid Forks, Brooks Saddle, Two Stands, Two Bags and full kit of Tools. Frame and Guards, etc., Coslettised, therefore rustless.

Standard 3¾ h.p. Touring Model, 42 Guineas.

Villiers Free Engine Model extra.

READ THIS.

Manchester,
March 11/12.

We have to compliment you on making such a perfect Motor Cycle. Ours has been subjected to most severe tests over bad roads, and with two and three passengers up, but it has never failed, nor had a single adjustment except the belt.

Yours faithfully,
H. N. KENDALL.

STERNOL

The Standard of Excellence

Sternol Motor Oils set the standard for quality and results. Some of the reasons why YOU should use Sternol are By doing so you reduce running expenses, better lubrication is secured at less cost (because Sternol is so economical); the engine runs cooler and gives out full power; and your Motor Cycle lasts longer because there is less friction and wear.

STERNOL

KING of MOTOR OILS

retain their full lubricating qualities at high temperatures. Harmful chemical changes carbon deposit, excessive smoking, hot bearings, etc. do not occur. Each grade of Sternol Oil or Grease is "just right" for its particular purpose.

Ask any good Agent for Sternol Oil or Grease, or write for full particulars stating requirements to

Two-stroke Engines.

THE question of the handicap imposed on two-stroke engines has again come to the fore. Both owners and manufacturers of motor cycles fitted with this type of engine are complaining that the handicap is unfair and think that the regulation should be repealed. Advocates of the two-stroke engine claim an increased efficiency for this type amounting in some cases to 60%; theoretically they should claim nearly 100%, because the number of working strokes is doubled, but owing to incomplete scavenging followed by a reduced charge and moderate compression the average claim is about 50 to 60%.

Now the A.C.U. handicap consists of multiplying the cubical capacity of the cylinder by 1.25 for air-cooled engines and 1.32 for water-cooled. If the gain in efficiency were only 32% this would bring the two types level, therefore the average claim of 60% means that if the cubical capacity were multiplied by 1.6 no great hardship would be imposed on two-stroke engines.

So much for theory, now let us consider how this theory has been borne out in practice, and what can be said in favour of reducing or removing the handicap complained of. In certain contests two-stroke engines are allowed to compete without any handicap, but up to the present they have shown no superiority in speed or power despite an increased fuel consumption. They have other prominent features, such as evenness of torque and great simplicity, and are therefore most comfortable to ride and easy to keep in tune, but on the road size for size we cannot admit they have shown themselves more than the equal of the almost universal four-stroke engine. If this be so why should the two-stroke engine be handicapped?

Number Plates.

IN the last issue we published an Editorial Note to a letter with reference to the position of number plates, pointing out that these should be vertical front and rear. Our attention has now been drawn to an action on the part of a superintendent of the Warwickshire Police, who, we understand, had threatened to summons certain riders because the registration mark on the front vertical plate was not sufficiently well illuminated by the lamp. The superintendent who made this threat stated that in his opinion the vertical plate used by motor cyclists was quite ineffective, and has, we understand, demanded that one of the A shape shall be fitted. Although we do not dispute the fact that the A shaped number plate may allow better illumination, no summons would prove effective against a motor cyclist for using *vertical* plates on the grounds that they were ineffective, because the Act distinctly states that the plates forming the identification mark shall be fixed, one on the front of and the other on the back of the machine in an upright position, so that every letter or figure on the plate is upright and easily distinguishable. In the case of a motor cycle the plate fixed on the front may, if it is a plate having duplicate faces conforming with the order, be fixed so that from whichever side the cycle is viewed the letters and figures on one or other face of the plate are easily distinguishable, although they may not be distinguishable from the front of the cycle. In strict accordance with these regulations the A plates would be illegal. The police can summon riders if the letters and numbers are insufficiently illuminated, but they cannot demand that a plate of any particular shape shall be fitted, provided the one in use conforms with the regulations.

The Pastime and Industry in France

BY DAGOBERT.

FRANCE is so near England, and the general touring conditions offer so little dissimilarity, that it is at first sight surprising to find such wide differences in the development of the motor cycle in the two countries. It is only necessary to frequent the main roads in the neighbourhood of London and Paris to realise that, notwithstanding the revival of which one has heard so much during the last few months, the Frenchman does not display anything like the same amount of enthusiasm for motor cycling as is shown by his neighbour across the Channel; it is further only necessary to examine a few of the principal types of machines to understand the entirely different conceptions of the pastime in the two countries.

Over 36,000 French Riders.

France possesses about 37,000 motor cyclists; the actual number of those paying taxes during the year 1911 was 36,549. The annual tax is almost self-collecting. Immediately after January 1st each motor cyclist is under an obligation to purchase a small plate at one of the tax gatherers' offices, or at one of the more important Government tobacco shops, and affix it to his machine. The plate costs 12 francs (10s.), and its presence on a machine is a guarantee that the tax has been paid. To safeguard against police proceedings in the case of theft, for the plate is generally clipped to the frame of the machine, and not soldered in position, it is usual for the purchaser to register his name at the office from which he has received it. Should the police discover a machine without a plate, they will generally take the trouble to verify the statement that the tax has been paid before instituting proceedings. It is obvious that the official returns based on the number of plates sold represent the minimum number of motor cycles in use, for there are a few riders who will run the risk of using their machines without a plate, a few more make one plate do service for two machines, and nobody pays the tax unless the machine is going to be used.

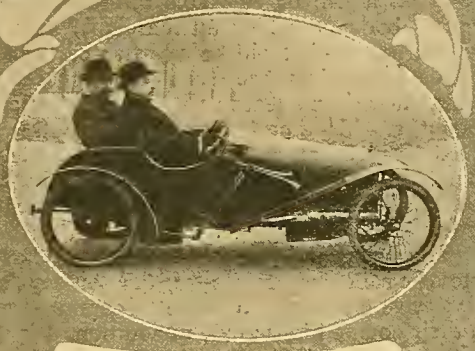
In addition to the annual tax, all motor cyclists are obliged to pass an examination and take out a driving licence similar to that issued to motor car drivers. A charge of 20 francs (16s.) is now made for the driving licence, although it was formerly delivered free. It is considered that this is an excessive charge, for, although the licence never requires renewing, it is hardly equitable that the driver of a 2 h.p. lightweight should have to pay as much as a man in charge of a 60 h.p. car. The French system gives a certain guarantee that the drivers are competent, and also allows of efficient police control, for each driving licence bears the portrait of the holder, and a duplicate photograph is kept at the police headquarters.

Last year was the high-water mark of the number of motor cycles in use in France. Six years ago interest began to wane in the sport, and the number of machines gradually dropped until in 1909 it had reached the low figure of 26,465. The following year there was a slight increase, and last year there was a big jump to the present record figures. Although the metropolitan district comprises the greatest number of motor cyclists, the movement is proportionately more strongly developed in several of the provincial centres. At Marseilles, Lyons, Boulogne, and the manufacturing towns of the North, around Havre, along the shores of the Mediterranean, and at the foot of the French Alps, motor cycling is very popular; it is rather interesting to note that it flourishes better in the hilly districts of France than on the plains.

The Bad Roads near Paris.

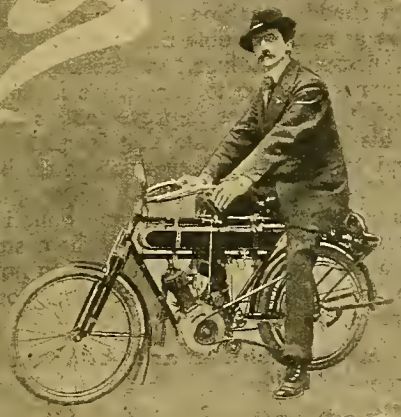
As Paris is the centre of the motor car industry, nine-tenths of the national output being from within a radius of five miles of Nôtre Dame, it is rather surprising that it should not be the same for the motor cycle. However, a city with an intense manufacturing belt around it, is hardly ideal from the standpoint of the motor cyclist. The Parisian, in whichever direction he wishes to ride, must pass over miles of ill-paved roads, sometimes of such an atrocious nature that it is painful to drive over them on a well-sprung car. It cannot be doubted that this difficulty of using a motor cycle in the immediate neighbourhood of Paris is in a certain measure responsible for the lack of riders.

In comparing the number of motor cyclists in France and England it must be borne in mind that the Frenchman does not have the same amount of leisure as the Englishman. To the average man the Saturday afternoon holiday is an unknown institution, and even the annual holidays are of shorter duration than at home. Most of the pleasure riding has to be indulged in on summer evenings, Sundays, and on public holidays.

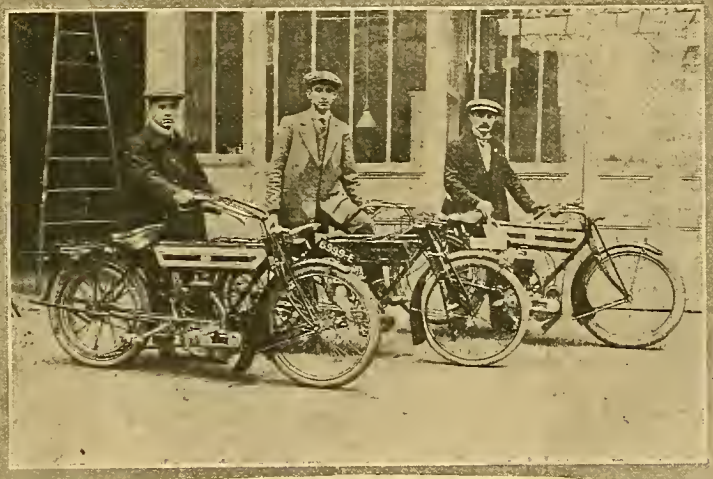


Club Life in France.

France does not possess a national body for the control of the sport. As a number of Englishmen have recently taken part in events organised by the Autocycle Club of France, an impression has arisen that this club has control of the sport. In justice to others, however, it should be pointed out that the Autocycle Club of France is only a metropolitan club, and in this respect differs in no way from the Motocycle Club of France, also with its headquarters in Paris. The two clubs are rivals, and they have both been very active in connection with the present revival. The only other organisation in the capital is the Touring Moto Club, an entirely amateur body. In the provinces, particularly at Lyons, Marseilles, and at Roubaix, there are very prosperous clubs, in no way inferior to those in the capital.



THE MOTOR CYCLE IN FRANCE.



A roadside scene in France. In the foreground is a Triumph. The lady rider of the tandem machine is adjusting her overalls before mounting.

The Baby. The latest model cyclecar on the French market.

M. Chartier-Desvarennes, president of the Motocycle Club de France, on his lightweight Magnat-Debon.

Three riders of British machines who figured prominently in French competitions last year. The machines are Triumphs and a New Hudson.

Start of a long distance town to town race in France.

Two French trade representatives and their T.T. Aloyon mounts.

The Pastime and Industry in France.—

Theoretically, the Automobile Club of France should exercise a control over motor cycling, but in practice it appears to have too much contempt for the humble two-wheeler to pay any attention to it whatever. As the present active period is likely to continue, it will be advisable to create a central controlling body, on which all the clubs, both metropolitan and provincial, will be represented. As the Automobile Club of France has so long ignored the motor cycle, there is no reason why its patronage should be sought at this time. Not only have the two Paris clubs arranged an extensive programme of hill-climbs, tours, reliability trials, and road races for the present season, but in the various provincial centres equal activity has been shown.

Paris being easily reached, English riders are more interested in the doings of the Autocycle and the Motocycle clubs, and promise to continue to take part in their competitions; but, in addition, it is understood that a number of English riders will again accept the invitation of the Motocycle Club of Lyons to take part in its Circuit du Rhone race.

Superiority of British Machines.

It is admitted, on both sides of the Channel, that the British motor cycle is superior to that produced in France. The causes of this superiority are not far to seek. Whilst for five years the number of riders was steadily dwindling in France, and manufacturers were content to turn out machines from year to year without any attempt at improvement, the English clubs were holding trials and competitions which not only stirred up enthusiasm but materially contributed to the all-round improvement of the touring mount. In the hey-day of its prosperity, the motor cycle in France was an instrument of sport, and as such it became more powerful, more noisy, and more dangerous, until at last it was abandoned entirely.

Even now, in motor car circles, the impression prevails that the motor cycle is a noisy, fast, dangerous machine subject to frequent attacks of breakdown. What has been lacking in France has been that close collaboration between the every-day rider and the manufacturer which, in England, has resulted in the production of the comfortable all-round touring mount. French motor cyclists, when brought face to face with English machines, are very much surprised to find that they are fitted with powerful engines, but that the power is not used exclusively for speed, but also in order to make them more comfortable, more reliable, and better hill-climbers.

From One Extreme to the Other.

From the powerful, heavy, road-racing type of machine, the change has been towards the opposite extreme—the lightweight single or twin. As an example may be mentioned the Peugeot Co., one of the largest in France, which formerly marketed a large number of 7 h.p. twin-cylinder machines, but is now doing most of its business with a twin-cylinder model of 55 × 70 mm. bore and stroke. Lightweights such as the Motosacoche, Magnat-Debon, Moto-Rêve, F.N., and Alcyon are the most popular at the present time. On these low-powered machines, frequently of only 330 c.c., the French makers do not fit such improvements as clutches and variable gears; indeed, the makers claim that by reason of the low weight they are not at all necessary. There is, however, a tendency to follow on English lines, and an example of this can be seen in the twin machine just produced by the Clément Co., one of the largest firms in France devoted to cycle construction. Their machine is one of the very few in France to be fitted with a clutch and variable gear, and, if we may judge by its success, the example is one that is likely to be followed. Perhaps the more genial climate of France is responsible in a very large measure for the neglect of protection on motor cycles. Certainly this is true in connection with pedal cycles, and it is doubtless because fair weather can be counted on with a greater degree of certainty south of the Channel than on the opposite side that French riders will accept totally inefficient mudguards and inadequately protected parts which would not be tolerated at home. We have never had mid-winter motor cycle trials in France, which probably explains why many manufacturers have not discovered that there are other considerations than speed.

The French Market.

The French trade has, unfortunately, to struggle against a demand for very cheap machines. The riding public has not been educated to the importance of quality, and too often fails to see the difference between a shoddy machine at £30 and a high-grade production at nearly double that figure. Refinements in finish, first-class fittings, and detail improvements all cost money, and so long as price is the first consideration any important improvement is hardly possible. This difficulty is one that English firms have to contend with when endeavouring to do business in France. They have, primarily, a better grade and a more costly machine than is usually built in France, and its price is further increased by the customs tariff. Notwithstanding this, it is satisfactory to note that at least two English firms have secured a good position on the French market.

Passenger Machines and Attachments.

The sidecar is altogether unknown in France, and as the trailer has long gone out of existence, for it was found to be dangerous and too costly, the taxation for this extra seat being the same as for the motor cycle, only solo machines remain. Instead of taking up the sidecar, the tendency is towards the development of the cyclecar. On every hand new machines are being brought forward, and both large and small factories are carefully studying the problem. Having developed the motor cycle to a very high degree, it seemed but natural that English makers should seek to improve it by adding another seat. In France, manufacturers do not start out with a perfected motor cycle, and their tendency is to work down from the motor car. Almost all the cyclecars on the French market are simplifications of the full-grown car, and are really very inaccurately described by the newly-coined word "cyclecar." If the existing gap between the car and the motor cycle is filled by the French—and I believe that it will be—it will not be by a glorified motor bicycle but by a simplified car. The Frenchman who can afford to buy a high-grade motor cycle capable of doing solo and passenger work, asks for something that really looks like a car, and if called upon to choose between a proved sidecar and an untried voiturette on car lines would almost always vote for the latter.

OCCASIONAL COMMENTS.

By "IXION."

Consumption Comparisons.

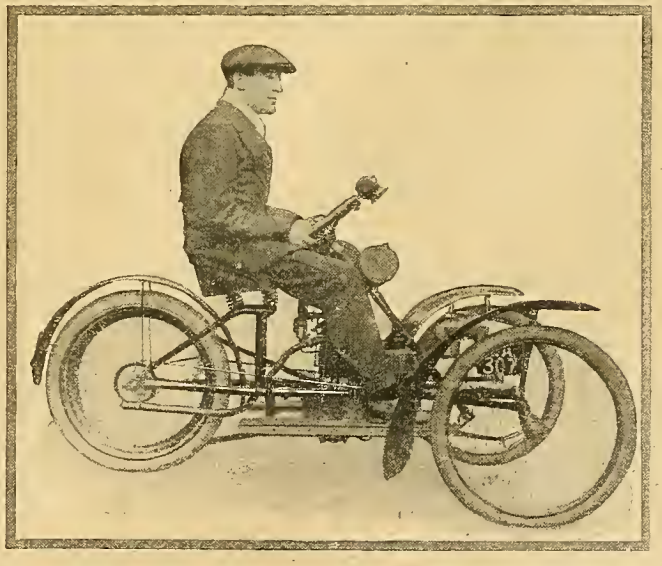
After reading the leading article in the issue of March 14th (with the above title), several of us began making enquiries. The point of the article was that motor cycles ought to be far more economical in petrol consumption, as compared with a 15 h.p. car. Judging by weight, which including passengers in each case is as 3 cwt. to 30 cwt., the car should require ten times as much petrol as the bicycle, whereas in reality the fuel proportions are as 1 to 5 (20 m.p.g. for the car, 100 m.p.g. for the bicycle). Judging by cylinder capacity, the consumption is proportionate, the car engine being just about five times larger than the bicycle's. The writer's view was that the different ratios of weight and area to atmospheric resistance may have something to do with the puzzle. My own opinion, based on many observations, is that there is a far greater waste of petrol at two points with the motor cycle. Excluding specially tuned machines, competing in consumption trials, there is often a great waste on motor cycles owing to the vibration and the wear of the float needle. A large percentage of privately-owned machines have leaky float needles and jumpy float needles; either the machine is leaking when at rest, with the petrol turned on, or it leaks in motion, when the tiny needle keeps jumping off its seat.

In the case of the car the needle is of substantial dimensions, and seldom wears much in prolonged use; while, owing to the complete springing of the chassis, it is unusual to find wet petrol slopping about on the lid of the float chamber as too often occurs with a bicycle. Secondly, there is a great waste with 90% of motor cycle engines, owing to partially atomised petrol being blown out at the air holes, when the inlet valve closes; these air holes are very close to the cylinder, and if the hand be placed close to them with the engine running, a wet spray is usually discernible.

On a car the main air intake is generally a long way from the inlet valve, and though wet spray may be blown back, it never reaches the air intake, and is not lost or wasted; if there be an air intake near the inlet valve, it generally possesses some type of light quick-acting valve, which will shut at the first blow-back and trap the backward rush of vapour.

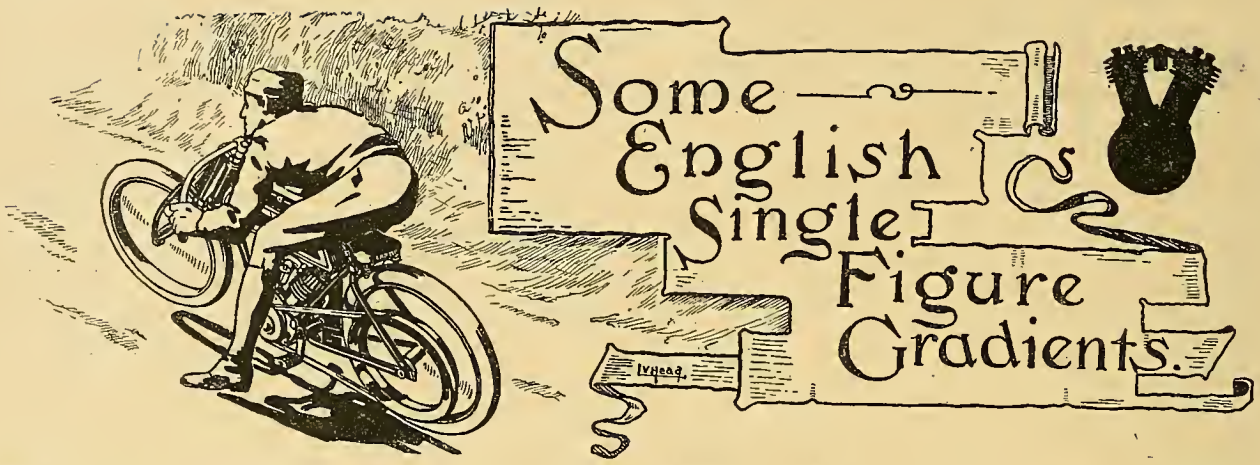
To speak of more concrete instances, I do not think any of several cars within a short radius of my house waste an ounce of fuel in 100 miles, while I am sure the motor cycles in the same radius waste an amount that cannot be measured. Experiments on the bench, with long inlet pipes, proper mixing chambers, and air holes distant from the valve chamber, would soon prove what waste really exists in this respect.

The Selection of Overall Leggings.



May I offer a few suggestions to riders who are now purchasing overalls and other garments. A very fruitful cause of unnecessary expense exists in the purchase of inferior overall leggings. A good pair should be cut exceedingly loose throughout, and a tall rider may have some difficulty in obtaining a pair of sufficient size. If they are at all tight in the fork, they are certain to split as soon as the rider mounts or dismounts hurriedly. If they are at all tight in the leg, the boot is sure to rip them badly; the leg should be made very wide by the insertion of a gusset, which can be folded in under the fasteners, when they are finally adjusted.

The strap which passes under the boot is often too short to admit of a stout boot being worn, is of poor leather so that wet soon destroys it, or is very flimsily attached to the sides of the legging.



It is an open question whether a seat is desirable or not; with a seat the leggings are likely to be badly ventilated, and most uncomfortable; without a seat, the rider is likely to suffer if he allow his saddle to get soaked in rainy weather. On the whole, I prefer a pair which comes high enough in front to cover the abdomen, and so prevent chills; but without a seat, in which case great care should be taken to protect the saddle in bad weather.

The coat may be had either in the form of a light waterproof, or of a heavy jacket, possibly including a leather breastplate and warm lining, waterproofed externally. Owing to the vagaries of the English climate, the amount of warm clothing required is always changing, and I personally prefer to keep the protections from rain and cold separate. Thus I employ two jackets, one of which is a waterproof pure and simple, the other being a thick tweed garment with leather breastplate insertions.

The weak points of most waterproof coats are want of looseness over the stomach and want of protection from wet entering at the neck. If the coat be at all tight over the stomach the bottom button will tear off and take a portion of the coat with it if the sewing holds, or rip its buttonhole whenever the rider does "splits" in mounting or dismounting. The neck, on the other hand, cannot be too good a fit; some riders use waterproof coats which do not fit the neck at all closely, and wrap a huge woollen cravat round the neck to fill up the interstices caused by the bad fit. A sopping wet muffler is most disagreeable.

The poor wee manufacturer is being outdone while the craze for home-made machines lasts—but we predict it will not be for long. The runabout above illustrated is a single-seater fitted with a De Dion engine and built by P. C. Boxer, of Brockley, S.E. Its chief drawback appears to be the absence of springs.

THE object of this article is to give our readers a few details regarding certain hills which form good tests for keen motor cyclists. Nothing is more fascinating to the motor cyclist than a rapid ascent of some difficult hill, the steeper the better, and, if one may judge by recent events, the keen and sporting rider will never tire until there remain no hills which he cannot easily climb. The suggestion that we tabulate a list of noted acclivities reached us from Mr. H. Wyndham Wood exactly a month ago, but, singularly enough, we had already commenced a list, realising how useful it would prove so long as the hill-climbing mania lasts. In some cases the figures given are only approximate, but are sufficiently accurate to give a fair idea of the gradients:

ARMS HILL (near Henley-on-Thames).—Length, approximately 1,200 yards; maximum grade 1—3, 600 yards 1—5½. Surface mostly bad; very greasy in wet weather. Two bends.

ASTON CLINTON (near Tring).—A long rise with a maximum gradient of about 1—8½. The chief difficulty is at the start, where a sharp rise occurs directly after rounding a right-angle corner to the left. After this the gradient becomes easy, and care must be exercised at the left-hand curve, which is worse than it appears to be. The hill then gets gradually steeper to the finish.

BARBROOK MILL HILL (near Lynmouth).—Length, 906 yards; maximum gradient, 1—3.64. The road is fairly straight, but rises 343ft. in the above distance, and the surface is usually very bad.

BIRDLIP HILL (near Gloucester).—Length, 1 mile 140 yards; maximum gradient, 1—5. The easiest grade on the hill is 1—15. There are no sharp corners, but three curves, of which the top is the most severe. The road surface is usually good, but after rain becomes very treacherous.

BRASTED HILL.—Length, about ½ mile; maximum gradient, 1—5½. Two bends, between which lies the steepest part of the hill. Surface fairly good; neither of the bends severe.

CUDHAM HILL (from Downe).—Length, 233 yards; maximum gradient 1—4.1, average 1—6.8. This is one of the most severe pitches within easy reach of London. The surface is generally quite good.

CUDHAM CHURCH HILL.—Length, 416⅔ yards; maximum gradient 1—5.74, average nearly 1—8. There is a nasty bend on the steepest pitch. This hill is not to be confused with the last-mentioned, which is shorter, but steeper. The roads join near the top.

COUNTISBURY (Lynmouth).—Length, about 2 miles, in which the road rises 900ft. No dangerous corners, but surface usually soft and bad. The steepest part is near the bottom.

DASHWOOD HILL (High Wycombe).—This is not a single-figure gradient, but is included, as it is a well-known hill. Length, 1,180 yards averaging 1—16, steepest part 352 yards of 1—10.9. Quite straight, with good road surface.

EDGE HILL (Kineton).—Length, about ¾ mile; maximum gradient, 1—7; road rises 360ft. There are three bends, the first being the most severe. Road surface good.

FARLOW BANK.—Length, about ½ mile; maximum gradient, 1—5. Hairpin corner to left; two bad corners. Road surface bad.

GREENHOW HILL (Pateley Bridge, Yorks.)—Road rises 1,000ft. in about three miles. The maximum gradient is 1—5.4. There are two bad corners on the steep part. Surface good when dry.

KOP HILL (Princes Risboro').—Length, about ¾ mile, maximum gradient 1—5 (approximate). The road gets gradually steeper till about half-way up, when it eases slightly, then gets steeper till it reaches its worst a short distance from the summit. There are no bad corners; surface fair, but rather loose.

LYNTON HILL (Lynmouth).—Length, about ½ mile; maximum gradient 1—4½, average 1—6. Though short, this is one of the sharpest hills in England; it is rendered worse by a bad corner at the bottom. Surface bad.

MUSWELL HILL (Crouch End, New Southgate).—793⅓ yards; maximum gradient 1—9½, average 1—12. A convenient test for Metropolitan riders. Surface fair.

NETHERHALL GARDENS (Hampstead).—Length, 760 yards; maximum gradient 1—7¼, average rise 1—18. The hill is approached by a right-angle turn off the Finchley Road, the worst pitch being before the left-hand turn. Surface fair to good.

NEWNHAM HILL (Daventry).—Length, about ¾ mile; maximum gradient, 1—6. The hill commences just after leaving Newnham village, and rises gradually to the cross roads; there is then a fairly level part until the right-handed curve by the barn; here the gradient increases rapidly till it reaches its worst just before the end of the hill. Surface usually very bumpy. With a fast machine care must be taken at the cross roads, the barn, and at the top corner after the finish.

PETERSHAM HILL (Richmond).—600 yards; maximum gradient 1—9½, average 1—15. An easy ascent, but a handy test hill for London riders. Surface good; easy bends.

PORLOCK (Somerset).—Length, about 2½ miles; maximum gradient, 1—4. Road rises 1,200ft. in above distance. Surface very bad; two bad corners and one bend.

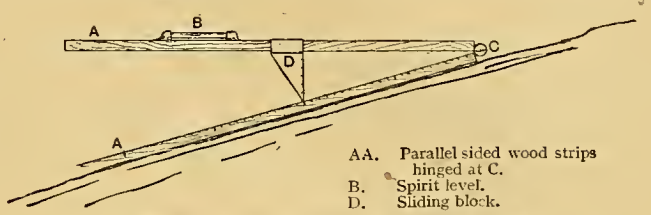
RIVER HILL (Sevenoaks).—Length, 1,444 yards; maximum gradient 1—9.8, average 1—13.4. Good road, easy curves.

STONELEIGH (MOTSLOW) HILL (Coventry).—452½ yards; maximum gradient, 1—9.34. Approached by right-angle turn, curves slightly right, then left sharper. This is a well-known Coventry test-hill.

SUNRISING (Stratford-on-Avon—Banbury).—1,093½ yards; maximum gradient, 1—6.43. Two sharp corners and a curve. Road surface good. The road curves to the left, then takes a sharp right handed turn, followed by a stretch of 1—7, the gradient getting worse towards the crest of the hill, where the road turns left again.

SUTTON BANK (Thirsk).—Length, 1,600 yards; maximum gradient, 1—3.9. The surface is generally very poor, and there is a sharp bend. This is one of the best-known Yorkshire hills.

Some English Single Figure Gradients.—



SAINTBURY.—Length, 2,341⅔ yards; maximum gradient 1—6.1, average 1—11.9. Surface moderate.

SWAIN'S LANE (N. London).—Length, 873⅓ yards; maximum 1—6¾, average 1—12.

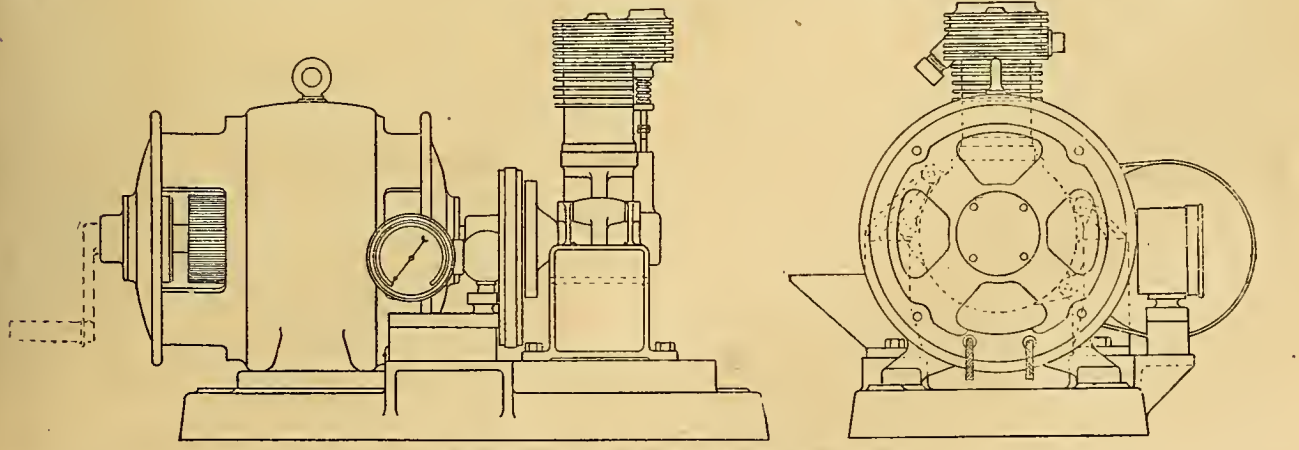
WESTERHAM HILL.—Length, 1,764⅓ yards; maximum gradient 1—7.8, average 1—13.4. Good road.

WILLERSEY HILL.—Length, 1,206⅔ yards, in which road rises 406.3ft.; maximum gradient, 1—5.9. Two corners; surface poor.

The above list gives a few of the better-known test hills, but does not aspire to being in any way a complete list. *The Motor Cycle* will be glad to hear of any freshly-discovered single-figure gradients, in which case the following details should be sent if obtainable: Whereabouts, length of hill, and total rise in feet, maximum gradient and condition of surface. For the benefit of those who do not possess a gradometer, a simple device, which we illustrate, can be constructed by anyone with the slightest mechanical knowledge. Obtain two stiff strips of wood about 4ft. long and have them carefully planed so that their edges are straight and parallel; hinge them together at one end so that the lower edge of one strip and the upper edge of the other would if produced pass through the centre of the hinge. Now mark off the upper edge of the lower strip in quarter or one-eighth inches, starting from the centre of the hinge. Fix and adjust a spirit-level on the top strip. Now arrange a triangular block to slide on the under side of the upper strip. The face of this block must be exactly at right angles to the upper strip and be of a certain known length

A simple device for measuring the gradient of a hill.

To ascertain the gradient of a hill all that is necessary is to lay the lower strip on the ground (it is usually necessary to sweep away loose stones, etc.) and adjust the sliding block till the upper strip is level. The grade will then be found by dividing the height of the block into the length in inches, marked by block from centre of hinge. Thus in sketch. The height of block is 6in., the point standing at 2ft. from the centre of the hinge ∴ we get $\frac{24}{6}$; grade 1—4.



How the Horse-power of an Engine is Tested.

LAST week an article by "Ubique" described in detail the older and more usual methods of finding the brake horse-power of motor cycle engines, the following is a description of the latest device used for this purpose. Fan and Prony brake tests, though useful in themselves, do not give so accurate a result as an electrical test; moreover, the Prony test is messy, and the fan test attended with some amount of risk, as mentioned in the article referred to, for a broken blade is capable of doing considerable damage, owing to its very high velocity, and, in addition, the results have to be worked out on formula in each case, and allowance made for belt slip and other factors (including the height of the barometer, if absolute accuracy is required when the fan test is employed).

The electrical testing set shown in the accompanying sketch is made by the Phœnix Dynamo Manufacturing Co., Bradford. The arrangement is very neat, and the results given are most accurate.

The engine is supported in a universal cradle, designed to take any normal crank case, and it can be fixed in position in a few minutes; it is coupled to the generator by means of a flexible coupling, the two halves of which slide together. The generator is capable of absorbing more than the full power of any 3½ h.p. engine, and runs at any speed required from 300 to 3,500 revolutions per minute. A tachometer is supplied, also a starting handle and magneto bracket, thus the whole set is absolutely self-contained.

To take the load a large control panel is fitted, having a wide range regulator for absorbing the generator current, and also a field regulator for giving a fine regulation of load. An ammeter, a voltmeter, and a wattmeter complete the set and enable the horse-power readings to be taken very easily.

Side elevation. End elevation.

Electrical testing set with engine in position on the cradle.

PETROL CONSUMPTION COMPARISONS.

THE comparison of the respective petrol consumption in ton-miles per gallon of a car and a motor cycle is an interesting and complex question. It cannot, in my opinion, be considered to be the outcome of any one cause, but rather the aggregate result of a variety of causes, some acting in one way and some in another. To begin with, a cycle is over-engined when compared weight for weight with a car. Taking the figures given in *The Motor Cycle* of March 14th, it will be seen that the cycle engine is more than one-fifth the capacity of the car engine, while the weight (with rider and passenger) is only one-tenth that of the car, so, if both were expected to show the same consumption in ton-miles, and the car does 20 m.p.g., the cycle must do 200.

Consumption and Cubic Capacity.

Again, taking the figures given, the consumption appears to vary approximately as the cubic capacity; this is a natural result if the weight be neglected, but, as the weight of the cycle and rider is half what it would be if the same proportion obtained throughout (viz., one-fifth), we should expect a greater mileage because the cycle engine would be running light for a greater proportion of its time than the car engine, and another point in favour of the cycle is the greater efficiency of its transmission: against this it must be remarked that an internal combustion engine is running most economically when running under full load and at a constant speed, and these desiderata are more nearly approached on a car than on a cycle, partly owing to the greater number of gears.

It is quite true that a two or three-speed gear does not improve the petrol consumption of any given machine; in fact, it is more likely to have the opposite effect, but it makes it possible for a 300 c.c. engine to do the work hitherto done by a 500 c.c. so far as the climbing of stiff gradients is concerned. This enables a man to do any given journey with a smaller engine, and therefore with a lower petrol consumption, although the weight is possibly unaltered.

The Importance of Gear Ratio.

Then, again, the top gear ratio must be considered. Taking the average of fifteen cars, we find that the fourth speed comes out at 4 to 1. This, with 32in. wheels, is equal to 3¼ to 1 with 26in., the standard size on a motor cycle. Thus, when running on top, the car engine turns thirteen times while the cycle engine turns sixteen, the cycle being geared 4 to 1.

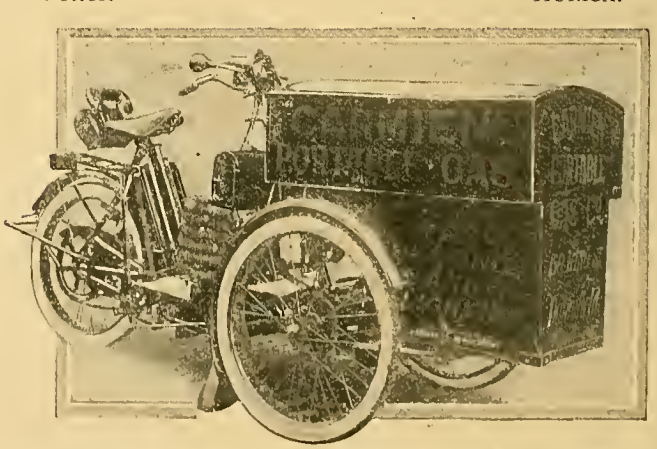
It may be urged that the cycle is not improved either in speed or running by raising the gear to about 3 to 1, and this is quite true, but it does not prove that the petrol consumption would not be better. The more even torque of a four-cylinder engine enables it to run comfortably on a gear which would be unpleasantly jerky on a single-cylinder, and the possession of four speeds allows the highest gear to be higher than it could be with only a single gear or two speeds at one's disposal. But against this it must be allowed that a motor cycle with its higher proportional capacity and lower gear will take hills easily on top for which a car such as that mentioned would have to drop to third or second speed.

If the speeds of the two vehicles differed much, air resistance would account for a great deal, as the power required varies as the cube of the speed; however, I am only discussing ordinary touring speeds, where the difference will not be excessive, though perhaps the bicycle will average a few miles an hour more than the car does. The area exposed to the air resistance, however, must be considered, and this, to give an equality in ton-miles, should be proportional to the weight, *i.e.*, if the car presents 30 square feet to the wind the cyclist should present 3 square feet, but except when the rider takes a racing position the area will be about three times that amount and consequently three times the h.p. and three times the amount of petrol will be consumed in overcoming it. To overcome this air resistance at 40 m.p.h. about 10 h.p. will be required by the car taking the constant as .002, but the cycle instead of needing only 1 h.p., the amount that should be necessary in proportion to its weight, requires 3 h.p. It must not be assumed that I regard 40 m.p.h. as an ordinary touring speed. It may represent 25 m.p.h. against a 15 m.p.h. wind.

Less Important Matters.

The tractive resistance between the tyres and the road is strictly proportional to weight, and so can be ignored. Water cooling makes an engine more efficient and possibly gives the car a further slight advantage, though, of course, the fact of the engine keeping cooler allows of a larger charge being admitted when required.

Advantages from a motor cycle point of view—

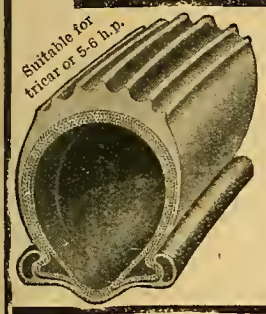


1. A more efficient transmission.
2. More running on top gear.

Disadvantages—

1. A larger engine in proportion to weight.
2. A lower top gear ratio.
3. The engine runs light for longer periods and the speed is less constant.
4. Greater air resistance in proportion to weight.

I have not discussed the carburetter question because so much depends upon the skill of the rider; in the hands of an expert a separate air control may be an advantage, but in the case of an inexperienced rider the automatic carburetter is undoubtedly the better.



AURIGA.

A converted 3½ h.p. Raleighette tricar with specially-designed body (and made by James Henshaw, of Stockport), to carry a Carmien petrol gas outfit. A side lever gear change, side lever brake, and magneto have been fitted.

Avon Motor Cycle Tyres.

Suitable for all climates.

Tricar.

A.C.U. One Day Trial.

Sir,—I notice that you inserted in your issue of March 14th a photograph of my tricar driven by me on Cudham Hill in the A.C.U. one day trial. I shall be glad if you will inform your readers that this was the only hill on which the tricar stopped, and that a little further down (before the photograph was taken) I was baulked by another competitor with sidecar, and therefore lost my engine speed. Had it not been for this, there is little doubt that I should have climbed the hill, as on a previous occasion not long before I had climbed this hill easily with the same gear.

G. N. HIGGS.

The Agency Question.

Sir,—If your correspondent's small local agent happens to run the only petrol depôt within a radius of a hundred miles, the former had better pay the five per cent. out of his own pocket, kiss and be friends.

If not, he should do his business with any of the large number of firms who have got capital and push.

After all, he needn't tell the agent where he purchases.

LA 2459.

Sir,—I had the same trouble last year about the above when I bought my present mount. The agent I bought my machine from told me that the agent of a district was unable to recover any percentage on a machine sold by an outside agent to a customer inside the district, unless the outside agent had made the sale by advertising or touting in the district. I presume advertisement in the press is excluded. In which case Mr. Topping need have no fear that the agent from whom he buys his machine will not get his commission. Perhaps some member of the trade will explain the case more fully.

FREE ENGINE.

The Silencer Trials.

Sir,—In order to make these a thorough practical test I beg to suggest that some means be found whereby the various makes of silencers shall be tested under exactly the same conditions.

It is obvious that a maker would prefer his particular silencer to be attached to a machine that was already comparatively silent, say a small twin rather than a heavy single.

Hence if the object aimed at is to discover, if possible, the most effective and efficient silencer, some other way will have to be found than that adopted by the M.C.C.

I understand that the M.C.C. silencer trial is to be regarded as a sporting event primarily for the interest of its members rather than for technical purposes, which means, I suppose, that while throwing the competition open, the real object is to encourage ideas from its own members rather than make any serious attempt to find what motor cyclists are so much in need of.

No mention is made of any test for back pressure, except the ability to climb an ordinary hill, which almost any motor cycle can do with a good margin of power to spare, which power might be absorbed by the silencer.

Surely under such unsatisfactory conditions the results of the trial will prove nothing, as almost any silencer can be made quiet if no account is taken of back pressure.

I suggest that only standard 3½ h.p. machines be used, if possible of exactly the same cubical capacity, so that the same volume of gas be dealt with, then throttle and air valves in all cases should be fixed so that all machines be run under the same conditions as to quality of mixture and amount supplied to the engine, it being obvious that a rich mixture with throttle fully open will make much more noise than a weak mixture throttled down, it being quite possible to alter the mixture and throttle down on approaching the judges if they were visible and their positions known.

I only mention this to show that failing similar conditions any so-called silencer trial will be useless unless the same silencer were tested in every one of the various classes arranged, which, of course, is not likely.

HILLS CLARKE.

A.C.U. and M.C.P.A. Committees.

Sir,—On behalf of the Motor Cyclists' Progressive Association I should like to reply to Mr. Harding's remarks in the issue of March 7th. I am glad to note that he does not question the need of such a body as the Progressives (how could he in view of the One-day trial fiasco?). It is only its constitution with which he finds fault. Apparently he considers trade influence too strong, but the figures he quotes to substantiate his remarks are inaccurate. Let me give the real facts and compare the present and proposed composition of those representing individual members and associated clubs on the Auto Cycle Union General Committee.

List of representatives recommended by the M.C.P.A. for individual members:

Mr. Harding states there are seven men actively engaged in the trade and three indirectly.

As a matter of fact only six are actively engaged in the trade and two indirectly, whilst four are private owners.

These figures need not alarm private members, seeing that in the old state of affairs five men on the committee were actively engaged in the trade and two indirectly.

We now come to consider the list of men recommended by the M.C.P.A. to represent the affiliated clubs on the General Committee of the A.C.U. Mr. Harding is wrong again when he states that five of the M.C.P.A. men are actively engaged in the trade and five indirectly. As a matter of fact four only are actively engaged in the trade and three indirectly, the remaining twelve being private owners.

Here again on comparing the old composition of those representing the affiliated clubs, it will be found that three men were actively engaged in the trade and three indirectly.

Summing up it will be seen that the composition of the Progressives' committee is made up of ten men actively engaged in the trade, five indirectly, and fifteen private owners, whereas Mr. Harding states that it is made up of twelve men actively engaged in the trade, eight indirectly, seven private owners, and three unknown. His suggestion, therefore, that the trade influence is too strong is ridiculous, as to all intents and purposes it remains in the same proportion as last year. Besides, why should not trade members do their duty as committeemen in such a manner as to demand the private members' confidence?

Coming now to the second part of his letter, in which Mr. Harding states that it has been urged against him and some of his friends that they are not practical motor cyclists. Mr. Harding acknowledges that he and his friends do not take part in speed contests, but ride their bicycles for pleasure. Surely, seeing that they are members of the Competitions Committee of the A.C.U., and help to make rules for reliability and speed trials, it would be better if they had some experience to back them up. It is the object of the Motor

Cyclists' Progressive Association to see that practical men should be elected on these committees. Where was Mr. Harding during the ill-fated one-day trial? Was he not a member of the Competitions Committee which drafted the rules and is responsible to some extent to see that they are carried out? What experience have he and his friends had of organising big trials, and were they as members of the Competitions Committee satisfied that satisfactory arrangements had been made for this event? Mr. Harding suggests that responsible leaders of the trade are satisfied with their joint committee meetings with the A.C.U., but if this is so, how is it that three of the oldest members of the trade have joined the ranks of the Progressives?

Finally, I would like to point out that it is not only in connection with trials that there is need for reform. In other matters the Auto Cycle Union will have to adopt a more businesslike attitude. What has happened to the A.C.U. Handbook, which was promised for March 1st? What have become of the proposed lamp trials we heard so much about? Perhaps Mr. Harding, as a member of the Competitions Committee, could tell us what he has done in reference to these points? If the Progressives come into power we hope to look into these matters.

W. G. McMINNIES, Hon. Sec. M.C.P.A.

[This letter was unavoidably held over.—Ed.]

Consumption Comparisons.

Sir,—I notice that in *The Motor Cycle* of Thursday, the 14th inst., you invite readers' opinions on the reason why the petrol consumption for a motor cycle is much higher than that of a car in proportion to their relative weights, etc., and I certainly consider that you have thereby opened up a very interesting field for discussion, which I am sure all keen motor cyclists will take advantage of, and it is to be hoped that such a discussion will definitely settle this much-debated point once and for all.

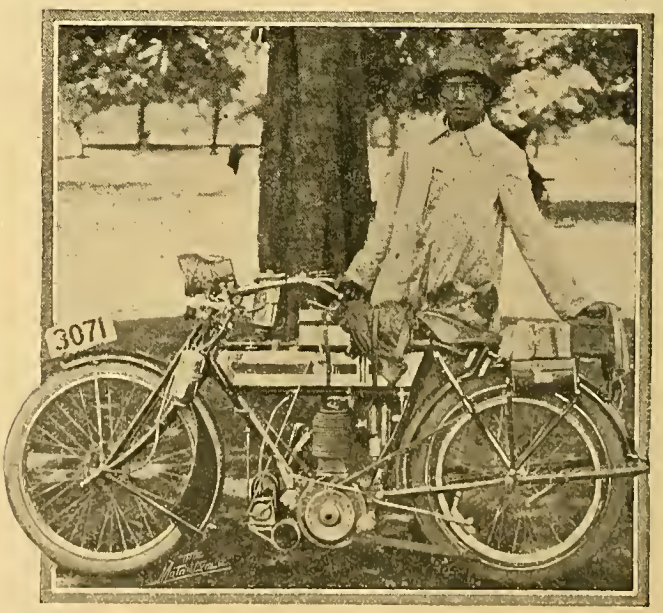
As far as my own opinion goes, I entirely agree with you that the difference in the two cases is certainly far too great to be accounted for by differences arising from air resistance or transmission systems, or any other mechanical differences, but, personally, I am quite certain that the cooling is at the bottom of the whole business. I do not think it will be denied that practically all cars have water-cooled engines, and that the low petrol consumptions obtained are with such cars, while almost all motor cycle engines are air cooled, and there is no doubt that the lower relative petrol consumption of the car is due to the much greater thermal efficiency of the water than the air-cooled engine. A little consideration of the two cases should easily convince anyone that such is the case, for a water jacket, although absorbing heat during the initial portion of the expansion or working stroke, gives up a lot of this heat during the latter part of the stroke, and this heat is accordingly converted into work by the engine. In the case of the air-cooled engine, however, any heat given up to the air during the initial portion of the stroke can obviously not be returned again in the latter part of the stroke, since the cylinder has by that time passed from the vicinity of the heated air and is then in contact with fresh cold air, which continues to abstract heat when it is really required by the engine to convert into work.

For this reason a large amount of heat energy is entirely wasted by the air-cooled engine. It will, therefore, be obvious that the thermal efficiency of the water-cooled is much greater than that of the air-cooled engine, and, in consequence, the former will give a larger amount of work for a given amount of petrol than the latter, giving a correspondingly lower petrol consumption for the same amount of work.

This question could be definitely settled if comparative figures were available of the petrol consumptions of cars having air and water-cooled engines. For this reason it would be very interesting if the owners of some of the many cyclecars and runabouts having air-cooled engines would give us the benefit of their experiences in the matter of petrol consumption.

C.S.P.

Sir,—In your remarks on consumption comparisons, you have set a very interesting problem, namely, why is it that a car engine will give roughly thirty to forty ton-miles per gallon of petrol, while a motor cycle engine gives about fifteen ton-miles per gallon. But of still greater interest is the next problem, namely, is this difference inevitable, or can a motor cycle reach the apparently greater efficiency of the car while still retaining its own peculiar advantages? Only careful experiment can decide which are the important points, for though, I believe, most of the necessary facts have been at some time determined, they are so scattered through a mass of literature that it would be difficult to make any great use of them. In these experiments we must have some definite measure of efficiency, say b.h.p. hours per gallon of petrol. The mere difference between a wet and a dry road would make a considerable difference if ton-miles per gallon were used. To compare the engines, first the modern car engine is multi-cylinder, water cooled, long stroke, has ample bearing surfaces, and is mechanically lubricated. The motor cycle engine is usually single cylinder, air cooled, short stroke, the bearing surfaces are often rather small, and lubrication is by splash.



What experiments have been made to determine the influence of each of these factors on efficiency as measured by b.h.p. hours per gallon?

Next we come to the question of transmission. What percentage of power is absorbed by belt, chain, or shaft? Does a change speed gear compensate for the power it absorbs by allowing the engine to be run more often at its most economical speed? (What effect has engine speed on efficiency?) And even now we have only got the horse-power hours per gallon transmitted to the road wheels. I believe, though, as I have said, the experimental evidence is almost absent, that on every point I have mentioned the motor cycle is somewhat less efficient than the car (with the exception of being single cylinder instead of multi-cylinder). Combined, the effect of all these causes must be considerable. Now, as to the force required to drive car or cycle along the road.

First, road resistance; every wheel of a car is sprung, perhaps, not ten per cent of the weight of a car is unsprung, *i.e.*, wheels, back axle, etc., except in spring frame machines not half the weight of a motor cycle is efficiently sprung. This must have some effect. You, sir, in your leading article, dealt with the wind resistance, though I am inclined to think the area of resistance of a car is less than you stated in most cases, but this only increases the force of your argument.

REGINALD FISHER.

Sir,—Your leader of March 14th on the above subject greatly interested me, and assuming, for argument's sake, the figures put forward by yourself, I have estimated the power which it would be necessary to apply at the tread of the wheel to propel the motor bicycle and the motor car at 30 m.p.h. The interesting result of the calculation is that it appears, as *à priori* reasoning would lead one to suppose,

J. E. Yee with his 3½ h.p. T.T. Triumph, on which he recently broke the Melbourne to Sydney record. The previous record held by W. Tormey stood at 34 hrs. 7 mins., which Yee improved upon by 2 hrs. 48 mins. The distance between the two cities being 577 miles, his average speed works out at 18.4 m.p.h. Both Yee and Tormey lost some time through lamp troubles and railway gates being closed.

that the engines are practically equally efficient as prime movers. The great discrepancy, therefore, in the two cases as regards the ton-mile economy must undoubtedly be looked for in the direction indicated by your leader, viz., greater relative wind resistance.

A summary of the calculation is as follows: Rolling friction of rubber wheeled vehicle on macadam road, 50 lbs. per ton; wind resistance per square foot of normal surface, .005 × [velocity in miles per hour]² lbs.

Motor Cycle, 336 lbs., 9 sq. ft.	Motor Car, 3,360 lbs., 30 sq. ft.
Rolling resistance = 336 × .022 = 7.38 lbs.	Rolling resistance = 3360 × .022 = 73.8.
Wind resistance = 9 × .005 × 30² = 47.9.	Wind resistance = 30 × .005 × 30² = 135.
Ft. lbs. per sec. = 44 (7.38 × 47.9) = 3.75 h.p.	Ft. lbs. per sec. = 44 (73.8 × 135) = 16.7 h.p.
At 100 m.p.g. at 30 m.p.h. = .3 gall. per hour. = .08 gall. per h.p. hour.	At 20 m.p.g. at 30 m.p.h. = 1.5 gall. per hour. = .09 gall. per h.p. hour.

The near agreement, on these assumptions, of the effective and shaft horse-power (to use marine phraseology) is also interesting. W. R. GERALD WHITING.

[We consider that Mr. Whiting is taking the constant of air resistance at much too high a figure. The Eiffel Tower formula gives .003 for flat surfaces, and the R.A.C. estimate is .0017; this was obtained from practical results at Brooklands. If, then, we take .002 (for ease of calculation), Mr. Whiting's h.p. hour figures become .15 gallon for the motor cycle and .146 for the motor car. This does not affect the force of his argument, which, however, gives a slightly undue importance to air resistance.—Ed.]

The A.C.U. Formula and Two-stroke Engines.

Sir,—With regard to the recent letters respecting the handicapping of two-stroke engines, your correspondents appear to have overlooked the important fact that the A.C.U. formula is an attempt to compare the performances of machines on the point of efficiency. It would be unfair to the four-stroke engine if the two-stroke engine were not in any way handicapped, to compensate for its very much higher petrol consumption. It may be quite immaterial to your correspondents whether a machine does 60 or 100 miles to the gallon, but it is a fact which has to be considered when the relative efficiency of the two types is being tested.

In any case, the A.C.U. handicap is not a great one, and I believe I am correct in saying that in the recent Essex M.C. hill-climb, the P. and M. and sidecar would have beaten the Scott and sidecar, even if the latter had been reckoned as a four-stroke.

A BELIEVER OF FOUR-STROKE EFFICIENCY.

Clutches and Variable Gears.

Sir,—Please allow me to reply to your correspondent "Commonsense."

I still maintain that the Indian clutch is one of the most flexible, if not the most flexible clutch, on the market, and that it answers the purpose of a variable gear within certain limits, *i.e.*, it will allow one to crawl in traffic, take a hill at a steady pace, and crest a steep hill, all the time giving a smooth drive. Naturally, if a machine be geared far too high for a certain hill no clutch in the world will enable it to climb it. As mentioned before, there are limits. Power is absorbed by the slip in the clutch and gained by increased engine revolutions.

I should like to say that, though I was credited with a stop on Cudham I kept my engine running and gained the top by turning in a circle. My failure was a combination of circumstances. A collision on Polesteeple Hill knocked my sidecar four inches out of track, causing it to drag heavily on the machine, and through others stopping in front of me I was delayed twenty minutes, and therefore had to drive all out to make up time. On nearing the steep portion of Cudham I was baulked by a non-competitor, and found my gear, in the circumstances, too high to allow me to pick up again without turning, as described above.

To a certain extent, the knowledge that my stoppage has caused "Commonsense" so much amusement somewhat compensates me for my failure in the trial. Before the start a friend remarked, "If you can't get through, get a laugh."

ERNEST FRASETTI.

Single-cylinder Class Limits.

Sir,—I notice a letter from the James Cycle Co. in the issue of the 21st inst. pointing out that the single-cylinder touring class for a certain open hill-climb is limited to 500 c.c. engines, and consequently several well-known machines are barred. May I point out to manufacturers of engines above 500 c.c. that in the classes for single and variably geared single-cylinder machines in our open hill-climb, to be held on Saturday, April 13th, no limit has been fixed. May I also draw the attention of manufacturers of cyclecars to the fact that we are including a special class for these machines alone. FRANK G. BARTON,

Trials Hon. Sec., Oxford M.C.C.

Lancashire Clubs and Competitions.

Sir,—With reference to a letter on the above subject from Mr. Winterbottom, trials secretary Burnley A.C., in last week's issue, I would like to say how pleased I would be to co-operate with him in what I concur is most necessary to the well-being of the sport, to wit, inter-club competitions. At the same time I would like to point out that the Mersey Motor Club called a meeting of club delegates to form an association to carry into effect the same plan, but unfortunately the necessary support was not forthcoming. However, if Mr. Winterbottom will send me his address through *The Motor Cycle* I will communicate further with him and give him all the assistance in my power.

S. W. CARTY, Hon. Sec. Mersey Motor Club.

Pillion Seats.

Sir,—Regarding Mr. Pritchard's query in last week's issue, I would say the way we started was as follows: First I got astride the cycle and had both feet on the ground; then my wife got seated, and I pushed off as well as I could. As soon as engine fired, I assisted with the pedals for a few yards; when it was downhill, even slightly was sufficient (and if possible we so arranged that it was), there was no need for this. Very occasionally some kind friend would give us a shove off, but the above was the usual way. My Bradbury starts very easily or this way of starting would be impossible. This year I have fitted a clutch, as it is neither dignified nor in a town very safe starting as we did.

CHAS. O. COX.

Climbing Honister Pass.

Sir,—Having read the claim of the Clyno Engineering Co., in which they state that they have succeeded in climbing Honister Pass—a feat which others dare not attempt—I am rather curious about the following points: (1) The gear used. (2) Whether, when Mr. Frank Smith accepted the challenge, it was understood that the Pass was to be cleared of loose stones, etc., as I understand was done.

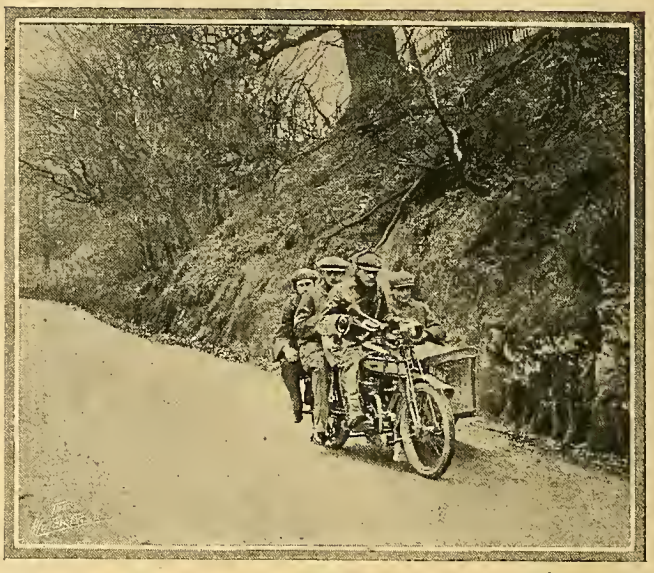
I note that Mr. C. R. Collier climbed Honister on a standard 8 h.p. two-speed Matchless, geared 9⅞ to 1. Certainly his engine was larger than the Clyno's, but if the Clyno's gear were as low as I have heard it to be, the efficiency of the Matchless combination was greater than the Clyno's. Also Mr. Collier, as I expected he would, climbed the Pass straight away, whereas Mr. Smith was there some considerable time before.

I suppose it is necessary to add that I have no interest in the Matchless Co. J. A. ROCHE.

[The gears used were stated in the article describing the event. See page 278, March 14th.—Ed.]

SUMMARY OF CORRESPONDENCE.

In the letter published last week signed Kenneth C. Orr, the word *unacquainted* should read *acquainted*.



"C.F.'s" letter should be signed with the writer's full name. With regard to the query raised, only one type of Clyno engine is made, bore and stroke 76×82 mm. = 744 c.c.

NOTICE.

The Editor disclaims all legal responsibility in any way for loss of copy in the form of manuscript, drawings, or photographs submitted to him. Rejected manuscript, drawings, and photographs will only be returned provided a stamped addressed envelope is enclosed for the purpose.

A TEST OF A BIG SINGLE-CYLINDER.

It is some considerable time since we have ridden an Excelsior motor cycle, consequently we jumped at the offer of a trial of one of the new 4½ h.p. models with Villiers free engine and sidecar. Having only a short time at our disposal, we chose Stoneleigh Hill for our test, and, the ascent with one passenger in the sidecar having been accomplished with great ease, we tried two, and this weight also the engine made light of. Finally, we collected three passengers, two of whom sat on the carrier and one in the sidecar. At the first attempt the machine failed only about five yards from the top, so a second and successful attempt was made after a short wait to allow the engine to cool. This feat was accomplished by a single-cylinder engine of 86 × 112 mm. with a single gear of 5½ to 1, and without clutch slipping. The Binks automatic carburetter was used. On the way home we took charge of the machine, and found it comfortable to ride, flexible, and devoid of knocking; while the big single gave one the impression of ample reserve power. In fact, though we came home three up, we never had occasion to open the throttle more than halfway. The machine was standard in every way, and fitted with two lamps, petrol tin, and all the usual accessories. The weight unladen was given us as just over 3½ cwts., and the total weight of the four passengers just over forty-one stones. This must be acknowledged to be an extremely fine performance, and it reflects great credit on the new Excelsior engine, which has proved itself ideally suitable for passenger work. There has of late been a distinct call for a big single-cylinder engine for sidecar work, as many motor cyclists prefer the simplicity of a single-cylinder engine.

A single-geared 4½ h.p. Excelsior climbing Stoneleigh Hill with three passengers and driver.

OXFORD M.C.C. MEMBERS' HILL-CLIMB.

The Oxford M.C.C. held a members' hill-climb on Irondown Hill on Saturday last. There were fifty-four entries. The results on formula were as follow:

Class I. (Lightweights).—1, R. H. Viggers (2¾ h.p. Enfield); 2, C. H. Boissier (2¾ h.p. New Hudson); 3, H. G. Hill (2½ h.p. Calcott).

Class III. (Touring Singles).—1, H. Graham Dixon (2¾ h.p. New Hudson); 2, H. T. Askew (3½ h.p. Triumph); 3, J. E. Webb (3½ h.p. Triumph).

Class IV. (Touring Twin Cylinders).—1, R. H. Viggers (2¾ h.p. Enfield); 2, R. A. Bishop (6 h.p. Enfield).

Class V. (Sidecars).—1, H. A. Beard (3½ h.p. New Hudson); 2, R. A. Bishop (6 h.p. Enfield); 3, J. E. Webb (3½ h.p. Triumph).

Class VI. (Any Single or Twin).—1, H. A. Beard (3½ h.p. New Hudson); 2, H. G. Hill (3½ h.p. Bradbury); 3, Graham Dixon (3½ h.p. New Hudson).

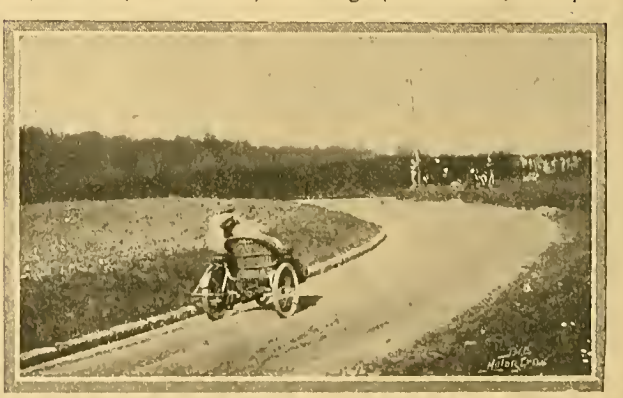
HILL-CLIMB AT ARGENTEUIL.

The contest organised by the Moto Cycle Club de France at Argenteuil on Sunday consisted of a flying kilometre and two kilometres uphill. The course was bathed in sunshine, and the drying action of the wind and sun, aided by the corporation sweeper, had rendered the road surface perfect for fast speeds. British-made machines were responsible for first places in three out of the six classes, Gabriel's Triumph being 20s. faster than any other machine in the 500 c.c. class, and the 2¾ h.p. New Hudson easily won Class II. under 350 c.c.—a 3½ h.p. New Hudson winning the 500 c.c. sidecar class at a speed of 25 m.p.h. Other machines which performed well were Peugeot, Motosacoche, and Réne-Gillet. The results were:

Class 1 (lightweights, 225 c.c.)—1, Detrez (Peugeot); 2, Piette (Motosacoche). Winner's speed, 24 m.p.h.

Class 2 (350 c.c.)—1, De Vay (New Hudson); 2, Milland (Motosacoche). Winner's speed, 37.3 m.p.h.

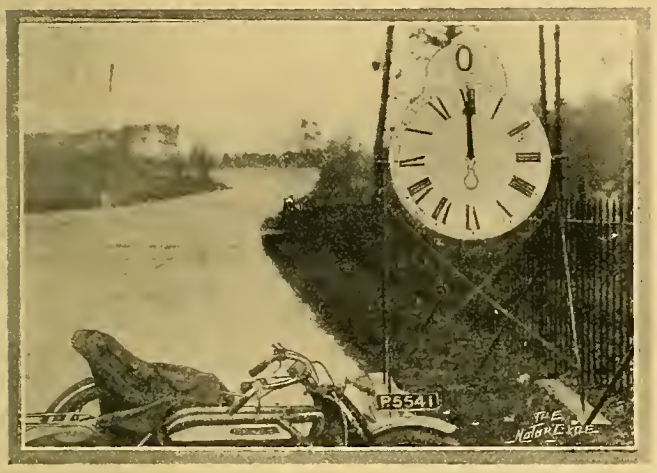
Class 3 (500 c.c.)—1, Gabriel (Triumph); 2, Elamber (Magnat Debon); 3, Dubost (Réne-Gillet). Winner's speed, 43 m.p.h.



Class 4 (over 500 c.c.)—1, Peau (Peugeot); 2, Debeaume (Réne-Gillet). Winner's speed, 44 m.p.h.

Sidecars (under 500 c.c.)—Lurault (New Hudson), 25 m.p.h.

Sidecars (over 500 c.c.)—Chédorge (Réne-Gillet), 27 m.p.h.



One of the bends at Argenteuil.

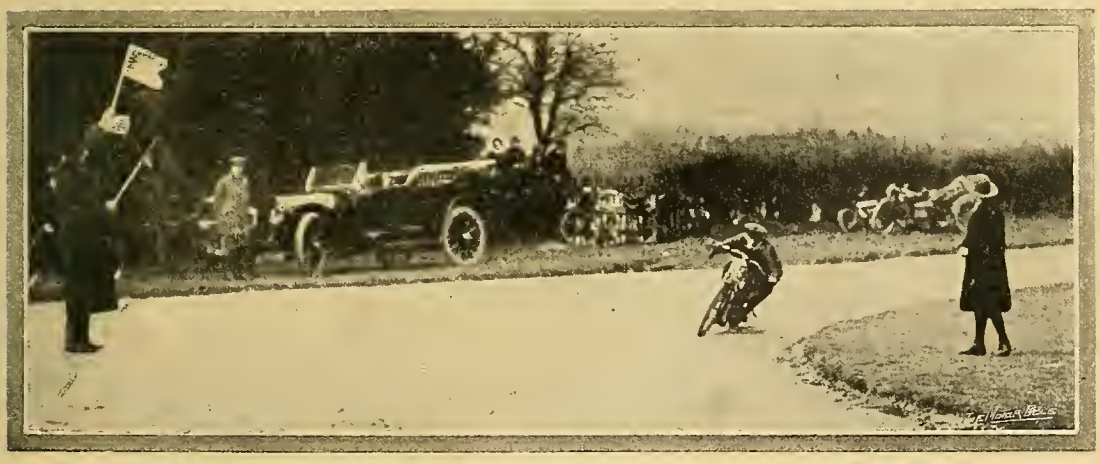
Chedorge (Rene-Gillet) competing in the Mete Cycle Club de France hill-climb.

B.M.C.R.C. MEETING POSTPONED.

EVERYONE in the motor cycle world had been looking forward to the B.M.C.R.C. meeting on Saturday last. It was to have been a most popular event, as *The Motor Cycle* telephone began ringing on Friday afternoon and continued till quite up to eleven on the next morning with queries as to the racing. These tintinnabulations are always the sign that an event is evoking interest, and it was the same last week with the Essex Motor Club Hill-climb, only, thank goodness, "Brooklands" is comprehensible on the telephone and Tring is not. No more is T-R-I-N-G, even when spelt out with careful enunciation, but we digress. At breakfast time on Saturday it *looked* fine and promising, at 10.30 a.m. it became overcast, at eleven it rained, at twelve it poured, at one it deluged, and just before that hour when we arrived at the track we met Major Lindsay Lloyd, Mr. N. C. Neil, and a Brooklands employee all wedged into the little yellow Sizaire, going as fast as its one cylinder would let it for the station.

The clock face which has been placed at the fork on Brooklands in connection with long distance races.

Brooklands reminded one of the "Thousand Islands." "A great place," said a competitor, "for water polo," but no use for motor cycle racing. Competitors, officials, and spectators were huddled under iron roofs for shelter. The timekeepers, Ebblewhite, Bidlake, and Reynolds, were walking away from the course as we arrived. One or two brave souls were trying their machines in the rain. Bashall was disporting himself on a small twin Humber. One or two sidecar machines were careering round the track or trying the test hill, but of racing there was none. Major Lloyd decided the point on a show of hands. Two-thirds voted against any racing on such a day, and the event was postponed till the following Wednesday (yesterday), and a full report thereof will appear in our next issue.



Two points in connection with this meeting are worthy of being placed on record. Firstly, mention must be made of the programme—a really useful production, with speed table, complete list of British motor cycle records up to January 1st, 1912, a distance table, and full particulars regarding the B.M.C.R.C.

The Brooklands Clock.

Secondly, we must refer to Mr. Loughborough's clock. This clock, for the design and manufacture of which the clever and capable honorary secretary of the B.M.C.R.C. is responsible, was completed at 2 a.m. on Saturday. It is not synchronised hourly from Greenwich. Yet it requires no winding. It has no works. Yet it ticks when required. You cannot set your watch nor tell the time by it. But it fulfils a useful purpose, and competitors would not for worlds be without the shining whiteness of its snowy countenance.

Its great dial gazes down the straight full in view of the competitors, just opposite the timekeepers' box. Behind it an official works its one wheel, on a spoke of which is a spring bolt engaging in a series of holes bored at intervals in a circle. Each hole represents a minute on the dial, and the snick of the bolt dropping into the hole is the only tick it can produce. This wheel controls the one hand, and the object of it all is to give the riders an idea as to how the time goes on a long distance race.

At the speed at which competitors travel handle-bar watches are of no use; they therefore have good cause to thank this simple evolution of the clever brain and the outcome of the deft hands of Mr. T. W. Loughborough, who has made the B.M.C.R.C. what it is.

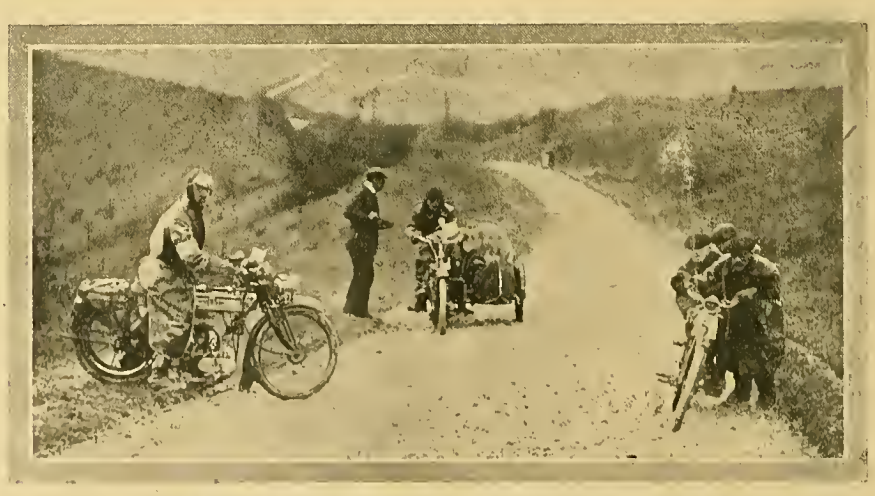
W. H. Elce (3½ h.p. Rudge) rounding the corner at the foot of Aston Hill in the Essex M.C. Open Event.

HERTS. COUNTY A.C. SECOND OPEN TRIAL.

General view of the starting point at Barnet.

PUNCTUALLY at 9.30 a.m. the first competitor was sent away from the Salisbury Arms Hotel at Barnet on Saturday last. A fair number of spectators watched the start in a slight drizzle.

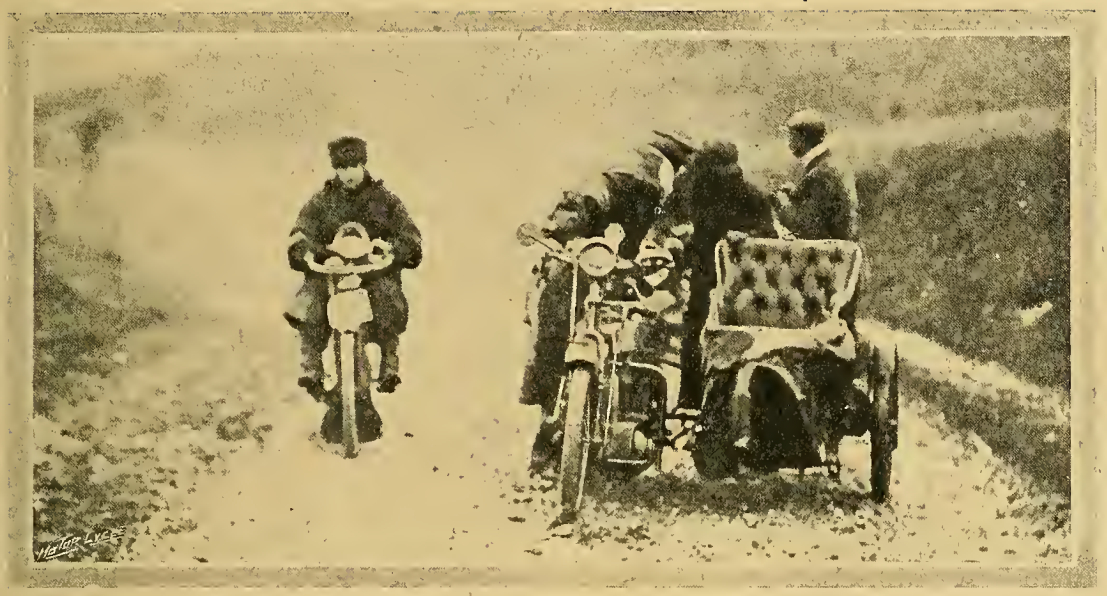
From Barnet the route led through Boreham Wood to St. Albans, where competitors were stopped one mile from the town. They then had to ascend Holywell Hill at under 10 m.p.h. The test proved the undoing of a good many. Full marks were only obtained by nineteen riders. C. W. Meredith (3½ Bradbury) and R. J. Charlesworth (3½ Zenith) made noticeably slow climbs, and the single gear brigade distinguished themselves almost without exception.



From St. Albans to Harpenden the roads were very heavy; in fact, till about three miles short of Luton mud-plugging was the order of the day. In Harpenden we met Charlesworth replacing a control joint pin, but as this was not a non-stop section he was able to do so without penalty.

Luton Market Place was crowded, but the local police were of great assistance in keeping a clear lane. Here we met Frank Smith with his Clyno and sidecar. He was very wroth because, although he turned up in time to start, he was unable to procure either numbers or a route card, and consequently he wisely refused to start thus handicapped. Then followed more mud to Barton-in-the-Clay. Here the second non-stop section started, leading through Hitchin, Shefford, Silsoe, and back to Barton.

At the foot of Sharpenhoe Hill and on the incline all competitors were stopped and had to restart. Most riders made clean ascents, as the surface of the hill was remarkably good. Here the rain started in earnest. Newsome (Triumph), Applebee (Centaur), and Gilham (Triumph) came up well. Collier (6 Zenith) roared up, but was baulked by Parkes (Enfield), who also went up well. The G.W.K. came up nicely and quietly, and many envied the dryness of the driver and passenger. Attenborough (5 Indian sc.) came up fast.



From Sharpenhoe to Dunstable the roads were awful, and it was quite a relief to get on to the London Road in that town, though it was only for about threequarters of a mile. Many competitors picked up petrol in Dunstable, so as to avoid the crush at Tring. On arriving at Tring the machines were parked at the Rose and Crown, and everyone had a bad time getting out of his filthy overalls; there was then a big run on the washhouse.

One hour was allowed for lunch, and competitors were afterwards taken direct to the timed hill-climb at Aston Clinton. This hill is now so well known that it presented little diffi-

ON KOP HILL, PRINCES RISBORO', IN THE HERTS COUNTY TRIAL.
Some competitors who found the combination of a 1 in 5 gradient, stony surface and white chalky slime too much for them. The photograph gives some idea of the condition of the hill.

Herts. County A.C. Second Open Trial.—

F. W. Gilham, (free engine Triumph), one of the seven competitors to ascend Kop Hill. Of the seven, three used single gears.

culty, and the surface was much better than we had expected. Newsome roared up and made the fastest ascent of the day. F. W. Applebee made fastest time in Class A, while in Class D E. G. Attenborough made fastest time.

Then came a stretch of narrow twisty lanes, followed by the precipitous descent of a narrow chalky hill, on to Wendover, where the road surface improved, and over an undulating course to Princes Risboro'.

Kop Hill Ascended with Hot Engines.

Now came what was a surprise to many, viz., the ascent of Kop Hill with hot engines. This proved the undoing of all but a few. The surface was awful, loose unrolled stones and soft greasy clay; and, had not a few made clean ascents, we should have said the hill was unrideable. Clean ascents were made by Newsome and Gilham (Triumphs). Dixon (3½ Zenith) got up at his second attempt. Fordham (Quadrant) was particularly noticeable, as, though he was twice badly baulked, he got up in style. Haddock (2½ A.J.S.) made a fine climb. Colliver (6 Zenith), Huckle (5 Rex), and Meredith (3½ Bradbury), also made clean ascents. H. Berwick (3½ New Hudson) made one of the best climbs. He was baulked halfway up the hill, and came to a standstill, but started up again on the bad part, and finished well. The machine was bouncing all over the road, and it was wonderful how he managed to keep in the saddle. No passenger machine climbed the hill straight away, though we hear that Rice-Pyle brought up his 8 Bat and sidecar at the second attempt.

After Kop Hill the pace was fairly fast, as nearly everyone had lost time. We passed the Indian, stopped with tyre trouble, and a rider of an Enfield adjusting his chains. Just before Missenden we met Haswell, who told us that the Brooklands meeting was postponed, owing to the water on the track. In Missenden the route takes a sharp left-hand turn, and a steep hill is encountered at once; thence through Chesham and up the sharp incline of Hampstead Road. Here we passed a N.S.U. rider apparently in trouble, though he repassed us again shortly afterwards. From Chesham the road led to Boxmoor, thence to St. Albans and the London Road to Barnet.

A Wet and Muddy Ride.

At the finish everyone was wet and muddy, but still cheerful, and there was much talk about the state of Kop Hill. The route was extremely well marked with arrows, and, in addition, paper had been laid where there was any possible doubt. Messrs. D. K. Hall and A. Sharp worked hard to get out the results on Saturday night, and managed everything except the results of the stopping and starting test at

The check at the foot of Sharpenhoe Hill.

Herts. County A.C. Second Open Trial.— Sharpenhoe, which had not come in. The single-geared Triumph, Premier, and Quadrant machines distinguished themselves in a trial replete with hills, and belt slip did not appear to be common in spite of the adverse conditions. F. W. Applebee's Quadrant ran beautifully throughout, as did

W. L. Overend (3½ h.p. P.V.) commencing the ascent of Sharpenhoe

Haddock's A.J.S. We also noticed H. F. Baige's Rudge make a fine ascent of Sharpenhoe. F. C. North (3½ Ariel) pluckily rode throughout the day, though, owing to a bad skid, he had damaged the steering head, and so had considerable trouble to keep a straight course owing to stiff steering. The results are given in the following table:

Results.

No.	Name.	Class.	Non-stop.	Schedule	Hill-climbing Fast.	Hill-climbing Slow.
1	C. C. Cooke (Triumph)	B	45	48	25	20
2	E. C. Jarvis (Triumph)	B	45	41	3	20
3	W. F. Newsome (Triumph)	B	50	49	30	20

ARMS HILL CLIMBED ON A SIDECAR.

Late on Monday evening we received the following telegram from R. A. Bishop, of Oxford: "Have just climbed Arms Hill, 6 h.p. Enfield and sidecar; total weight rider and passenger, 13 st. 13 lbs.; first ascent by sidecar combination and passenger; witnessed by Secretary Oxford Motor Cycling Club and others.—R. A. BISHOP."

This is an excellent performance, on which we congratulate Mr. Bishop and the makers, the Enfield Cycle Co.

OPEN RELIABILITY NON-STOP RUN IN NORTH WALES.

The open reliability trial which is being organised by the Liverpool A.C.C. for April 13th is open to any class of vehicle controlled by the A.C.U. Route: Start Hamilton Square, Birkenhead, 8.30, Chester, Rosset, Cefn y-bedd, Bwlchgwyn, Wrexham, Ruabon, Llangollen, Llandegla, Ruthin (lunch control, one hour), Loggerheads, Mold, Cilcain Hill, St. Asaph, Rhuddlan, Newmarket, Holywell, Bagillt, Halkin, Northop (tea control, half an hour), Hawarden, Chester, finish Hamilton Square, Birkenhead; distance, 160 to 170 miles. A gold medal will be awarded to every competitor making an absolute non-stop; certificates to every competitor completing the course. Competitors will ride in pairs, and will observe one another, in addition to which there will be travelling marshals and observers on each steep hill. There is no marking or guessing at times or speeds, no timed hills, no examination of machines—in fact, it is a purely straightforward non-stop run.

The G.W.K. cyclecar climbing Sharpenhoe, which is a cutting between chalk cliffs

In a Sidecar

UNTIL last week I was quite contented with an ordinary smooth-running respectable push-cycle. I denounced the motor cyclist as a noisy, petrol-breathing, vibrating, and totally unworthy fellow traveller, who missed the health-giving exercise of the cyclist, and gained nothing but insane speed. I was convinced of the supreme joys of pedalling, and even went so far as to write a revised edition of "Love, the Pedlar." But an enthusiastic motorist has destroyed all my arguments by the simplest of all processes, which I might describe as *solvitur motorando*.

At first I was reluctant to make the experiment, but the enthusiast knew my weakness. "I'll guarantee to frighten you," he said cunningly. "I'll make you genuinely alarmed by the speed." Of course, I denied "the soft impeachment," and promptly entered the sidecar. We travelled for an hour and did twenty-eight miles; and now I am crying out for a motor cycle every hour of the day.

In the beginning the motion was unexpectedly smooth and luxurious. We went along at a moderate pace through the town: but even then there was a sense of power which was intoxicating. It was like the joy of gripping a high-mettled horse; but it was many horse-power.

Then when the outskirts of the town were slipping behind, our speed increased. We began to shoot past the ordinary traffic—the lumbering drays and clanging street cars, and we outraced the cycles as a comet outleans the creeping stars. The sense of power became a thrill, a tingling joy; and I wanted to shout in the

Sheer Pleasure of Motion.

I felt a temptation to keep on guard—an entirely foolish impulse to be watchful and wary. Keenly watching each new turning for an out-rushing vehicle, gripping one side of the chair as if to leap alertly out or vaguely imagining that caution could stop the machine or brush aside the obstacle. The instinct was futile, but quite natural. Possibly it was due to a little timidity or a sense of helplessness. Then something happened. . . . The machine suddenly doubled its speed and gulped down the road. The feeling of timidity vanished as a useless thing; I flung it off as a diver flings off his clothes; and we plunged into space. I lay back with feet pressed against the front of the chair in complete abandonment to pure joy. To say that we flew is a weak metaphor, and conveys no idea of the experience—we were hurled along like a projectile. The velocity seemed to double and double again. It grew, multiplied, accelerated. It became vertiginous yet exultant; it became an all-absorbing passion; a sense of power which made us god-like; it was like a divine thunderbolt, a soul racing like a star. We were being whirled into infinity, into eternity; and the wild joy filled me like a gale. Time and space became trivialities; I was superior to all such paltry things; I drank eternal life, till I was drunken as with old wine.

The landscape flew by on either side; we sped up hills and swooped into valleys; we switchbacked over undulating country, yet we seemed not to touch the road. The telegraph poles ran by like Indians on the trail. The country-side galloped past with a thousand Gilpins in full chase. Bridges dashed towards us and leapt over us yelling like boys at leap-frog. The earth's own motion came into our ken, and we became part of the cosmic consciousness.

Fear was impossible in that state of delirious emotion, and I began to understand that primeval revelry when the stars of heaven sang together. I also wanted to shout for joy. . . . Then we stopped. Everything became mute and dead. People crawled about the streets, and traffic moved slumberously past. The thrill of life faded into a dead-and-alive existence, and my cycle has become a commonplace.

NOVICE.

A SIDECAR TRIAL ON NOVEL LINES.

Something original in the way of competitions is the sidecar trial arranged by the Coventry and Warwickshire M.C. for Saturday, April 13th. Though there are thousands of motor cyclists who use 3½ h.p. machines with sidecar attachments, so far no trial has been organised to show up their capabilities. The Coventry M.C. trial is confined to members, and only sidecarists will be competing.

There will be two classes: (1.) For machines up to 500 c.c. (2.) For machines over 500 c.c. A special prize is offered to the driver of a single-geared sidecar who accomplishes a non-stop run from Coventry and ascends farthest up the test hill, which will be on the noted range of Edge Hills. Those competitors who succeed in climbing the test hill will be guided along a short circuit to the foot of the hill and be expected to repeat the performance *ad lib.* until only one non-stop survivor remains to take the prize.

The hon. sec. will issue particulars and entry forms this week.

RICHMOND MEET OF MOTOR CYCLISTS.

We were informed last week that there was a rumour in the North that the Good Friday meet of motor cyclists at Richmond had been abandoned. We immediately communicated with Mr. Geoffrey W. Liddle, of the Middlesbrough and District M.C.C., and have received a reply from him, of which the following is an extract:

"The Good Friday meet of motor cyclists has always been arranged by a private organiser until last year, when the Northern League made the arrangements. As this meet has attained great success, I think it would be a pity to allow it to fall through, and therefore I am again writing the secretaries of motor cycle clubs inviting them to foregather once again this year. My strongest reason for wishing the continuance of this meet is that it seems the only event in which all motor cyclists may participate irrespective of club or union. I must also say that in my own opinion there is no pleasanter manner of spending a few hours than in the company of fellow wheelmen. My fellow clubmen intend spending the day in Swaledale, arriving at Richmond at or about 11 a.m., having lunch at about 12.30, joining in the massed group photograph for *The Motor Cycle*, and then proceeding further up the dale for tea at Reeth or Healaugh, returning home in the evening. I think the Harrogate, Leeds, Hartlepool, Newcastle, and Scarborough Clubs intend joining in the meet.—Geoffrey W. Liddle, Hon. Secretary Middlesbrough and District M.C."

We agree with Mr. Liddle that it would be a pity to allow the Northern Meet to fall through, and trust the arrangements he is making with secretaries of northern clubs will be successful.

At the top of the steepest pitch on Aston Hill during the progress of the Essex M.C. first open hill-climb of 1912. (See last issue.)

THE M.C.C. OPEN COMPETITION FOR MOTOR CYCLE SILENCERS.

This trial will be held on a circular course near London on Saturday, April 27th, starting at 3 p.m. The object is to endeavour to demonstrate that the motor cycle engine can be efficiently silenced without causing it to show perceptible loss of power.

Rules and Conditions.

Classes.—Classes 1 and 2, lightweight motor cycles not exceeding 350 c.c. Classes 3 and 4, motor cycles exceeding 350 c.c. Class 5, motor cycles with any size single-cylinder engines and sidecar. Class 6, motor cycles with any size multi-cylinder engines and sidecar.

Type of Silencers.—Competitors may use any devices they think fit to render their motor cycles silent, but such devices must, in the opinion of the judges, be of a practical nature, and capable of being adopted as a permanent fitting to the motor cycle.

Course.—A circular course, not exceeding five miles in length, in the neighbourhood of London, will be chosen, and competitors must cover this three times without a stop, unless otherwise directed by the officials in charge.

A hill of fair gradient will be included in the course, and competitors will be required to ascend the hill at the following minimum speeds: Classes 1, 2, and 5, minimum speed 15 m.p.h.; Classes 3, 4, and 6, minimum speed 19 m.p.h. Excessive speed will disqualify. Competitors failing to climb the timed hill in the required minimum time will be penalised accordingly.

Start.—Competitors will be started at suitable intervals, and must not ride within two hundred yards of each other during any part of the competition.

Stops.—The competition will be in the nature of a non-stop run, but competitors may be stopped by the officials to maintain proper spacing, and for any other purposes.

Judging and Marking.—Judges will be stationed at various points on the route, and in some cases will not be visible to the competitors. Each judge will make independent reports, and give marks, based on a graduated scale, for the silence of each machine as it passes him.

At the conclusion of the trial, the judges' reports and marking will be tabulated by the official timekeeper, and the winner shall be the competitor who thus obtains the most favourable markings.

The trial hon secretary is Mr. W. E. Southcomb May, 34, Gower Place, W.C., to whom all entries, fees, etc., must be sent. Entries must reach the trial hon. secretary on or before the first post, Saturday, April 20th

Despite the bad state of the roads on Saturday the Motor Cycling Club carried out its opening run to Brighton. The photograph was taken outside the Old Ship Hotel the usual M.C.C. rendezvous for this function.

SIX DAYS' SIDECAR RIDE.

The following is the mileage claimed to have been accomplished by A. Butler on the sidecar ride mentioned last week, see page 316 (mileage from abridged Contour Road Book):

London to Brighton and back	104
London to King's Lynn	100
King's Lynn to London (lost way, made detour to March, and came back to Ely to reach main road again)	120
London to Newmarket and back	120
London to Reading and back	84
London to a point near Harlow and back ...	42
London to Staines and back	38
London to Great Melton and back	96
London to Chelmsford and back	60
London to Cambridge and back	112
London to Reading and back	84
London to Cambridge and back	112
London to Hungerford and back	136
London to Kelvedon and back	84
London to Cambridge and back	112
London to Guildford and back to Balham ...	55
Total	1,459

INTER-CLUB HILL-CLIMB AT EASTER.

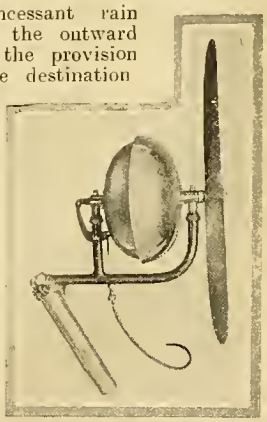
The following classes, etc., have been settled for the Harrogate and District M.C.C. and Herts County A. and A.C. joint open hill-climb on Saturday, April 6th, on Leathley Bank, near Harrogate.

1.—Standard lightweights up to 350 c.c.
2.—T.T. lightweights up to 350 c.c.
3.—Standard singles up to 600 c.c.
4.—T.T. singles up to 600 c.c.
5.—Standard multi-cylinders up to 670 c.c.
Lightweights not eligible for Classes 3, 4, and 5.
6.—Passenger machines, sidecars, and cyclecars up to 1,100 c.c. carrying a passenger of not less than 8 stones.
All the above on A.C.U. formula.
7.—Any single-cylinder on time.
8.—Any multi-cylinder on time.

The special P. and M. Team Trophy will be awarded for the team prize.

Particulars may be obtained from Mr. H. W. Fortune, St. James's Chambers, Harroagte, or Mr. C. C. Cooke, Rose Cottage, North Mimms, Hatfield.

M.C.C. OPENING RUN TO BRIGHTON.



A. Butler (3½ h.p. A.S.L.-Precision and Comfy sidecar), on which he recently accomplished 1,459 miles in six days. A table of the distances is given above.

Several members of the M.C.C. who had journeyed to Brooklands in order to witness the racing at the B.M.C.R.C. meeting left the track at about 4 p.m. for Brighton, there to meet fellow members of the club for the opening run

The roads and weather were severe, and most users of belt-driven machines had a good deal of trouble A blustering wind and almost incessant rain detracted from the pleasure of the outward run, but amends were made by the provision of a concert and dinner at the destination Eighty-five sat down to dinner at the Old Ship.

With the homeward run on Sunday came the promise of spring. The weather was quite warm, and the sun shone throughout, while so quickly had the wind dried the roads that they were inclined to be dusty. The Brighton Road was alive with motor vehicles, and, if the conditions on that famous road can be taken as a criterion, the coming season will find the sidecar pre eminently popular. There ap peared to be more passenger carrying motor cycles on the road than any other class of vehicle, and a very large pro portion of these were multi speed singles. Lightweights were also strongly represented.

Forty members stayed at Burford Bridge for luncheon.

The Helisenne, a novel French motor gong to take the place of horn or whistle. It is actuated by a screw, set in motion by the passage of the machine through the air, which causes a set of clappers to revolve inside the gong

TIME TO LIGHT LAMPS.

Mar. 28th	... ...	7.23 p.m.
,, 30th	... ...	7.27 ,,
April 1st	... ...	7.30 ,,
,, 3rd	... ...	7.33 ,,

Joint Open Hill-climb at Easter.

Permission has been granted to the Harrogate and District M.C.C. and the Herts County A.C. (motor cycle section) to hold a joint open hill-climb on Leathley Bank, about six miles from Harrogate. The hill is about a mile long, and for practically its whole length is extremely easy; about two hundred yards from the finish, however, there is a rather sharp left-hand bend, immediately followed by an exceedingly steep gradient.

A.A. and M.U. and Manufacturers.

We have seen a letter from the secretary of the A.A. and M.U. addressed to motor cycle manufacturers, asking them if they are willing to place a prospectus of the Union in the toolbag of a machine when it is delivered to a customer. A commission of 2s. on each member obtained through this medium is offered. The A.A. and M.U., in adopting this system, has, we believe, taken a leaf out of the Federation of American Motor Cyclists, which recently induced several American manufacturers to adopt similar lines. We wonder how many British makers will fall in with the scheme?

M.C.P.A. Meeting.

Those who are interested in the excellent work done by the Motor Cyclists' Progressive Association are asked to be good enough to attend at the Associates' Room, R.A.C. Western Entrance, 89, Pall Mall, S.W., at 2 p.m., on Saturday next, the 30th inst., when the objects and aims of the Association will be explained to those who have not yet had an opportunity of making themselves familiar with them. We referred briefly in our last week's issue to the M.C.P.A., and we strongly advise those who wish to become fully acquainted with its working to attend this meeting.

Motor Cycle Paced Records.

Now that the N.C.U. recognises motor cycle paced records there will be many aspirants for honours in this respect. At Herne Hill, on April 5th, H. Knowles, of the Polytechnic C.C., will endeavour to set up a new one-hour record, previous to the commencement of the L.C.C.U. meet. H. A. Cooper, a motor cyclist of nine years' standing, and holder of eighteen gold medals and five A.C.U. first-class certificates, will this year try his hand at pacemaking, making his *début* at Herne Hill on April 5th, pacing H. H. Lee, of the Kentish Wheelers, in the big motor cycle paced match.

Motor Cycling in New South Wales.

In spite of the bad road surfaces, the number of motor cyclists is steadily increasing in Australia, as the constant receipt of letters from readers in the various States testifies. The pastime is not confined to those who live in the big towns, where the roads are comparatively fair—it is indulged in quite as keenly by enthusiasts scattered about in the up country districts, where there are no roads worthy of the name. A "country" reader, Mr. A. B. Garlings, who lives at Gilgandra, in the western district of N.S.W., sends us the photograph, reproduced herewith, of Miss Hilda Maguire and himself with his 1908 Triumph and Montgomery sidecar. This combination has given satisfactory results, and that an average speed of 20 m.p.h. can be maintained, with a maximum of 40, speaks well for the machine itself and the sidecar. The machine is fitted with a Mabon clutch and single gear,

A. B. Garlings, of Gilgandra, who, in sending us the above photograph, mentions that there are no unavoidable hills which he cannet climb in his district on the 3½ Triumph sidecar depicted, and an average of 20 m.p.h. is easily possible.

but Mr. Garling adds that a two-speed gear and a somewhat larger engine would often be acceptable.

Auto Cycle Union Notes.

MEMBERSHIP.—One hundred new members were elected at the last committee meeting of the Auto Cycle Union.

AFFILIATION.—The Isle of Wight M.C.C., which has thirty members, has become affiliated.

BRIDGE TOLLS.—The Anglesea Motor Union recently brought to the notice of the Auto Cycle Union the excessive charges imposed on motor cyclists crossing the Menai Bridge. His Majesty's Office of Works, on being approached by the A.C.U., replied to the effect that it was not practicable to vary these charges before the expiration of the lease of the bridge, which would come about in 1913. The A.C.U., however, will not lose sight of the matter.

R.A.C. LOCAL GUIDES.—The R.A.C. local guides, who will be installed on the roads immediately before Easter, will, as has been previously stated in these columns, be entirely at the disposal of members of the A.C.U. and affiliated clubs who carry the A.C.U. badge on their machines. The Auto Cycle Union has decided to send a contribution to the Royal Automobile and Associated Clubs to help defray the cost of maintaining these guides upon the roads.

T.T. RACE.—It has been decided to ask the Highway Board of the Isle of Man to extend the time of practising in the morning to not less than two hours, as it is not reasonable to expect a competitor to accomplish two circuits of the course in less time.

THE SILENCER TRIAL.—Col. H. C. L. Holden and Mr. E. M. P. Boileau recently inspected the works of Messrs. Auto-Carriers, Ltd., Ferry Works, Thames Ditton, with a view to obtaining permission to use one of their shops in which to hold the Silencer Trial. Mr. John Weller kindly agreed to place a portion of the firm's engine testing room at the disposal of the Union for the trial. Mr. A. M. Low has been invited to serve on the Silencer Sub-committee.

A USEFUL REGULATION.—It has been decided to add the following regulation to all entry forms: "Competitors are required to inform the secretary, immediately before taking part in this competition, of any difference which may exist between the specification appearing on the entry form, and that of the machine he is actually riding."

THE SECRETARY'S RESIGNATION.—Mr. F. Straight, who has for so long been connected with the motor cycle movement, has tendered his resignation as secretary of the Auto Cycle Union, which resignation has been accepted with the greatest regret by the committee, who heartily thanked him for his nine years' service in connection with the Union, and voted him an honorarium of £100 as a recognition of his past work.

Subject to confirmation by the General Committee, Messrs. F. T. Bidlake, J. H. Burley, H. H. Gritlin, and F. Straight have been appointed as official timekeepers.

Permits have been granted to the Harrogate and Herts County M.C.C.'s to hold an open hill-climb on April 6th.

SPECIAL FEATURES.

Single Figure Gradients.
The Pastime and Industry in France.
Herts County A.C. Second Open Trial.
Consumption Comparisons.

A Sportsman.

Alan E. Woodman, the one-legged motor cyclist, has provisionally entered his 2¾ h.p. twin Humber for the junior T.T.

Inter-club Event in South Wales.

The South Wales A.C. and Cardiff M.C. are co-operating to run an open hill-climb at Caerphilly, near Cardiff, on Thursday, July 18th, and open speed trials on the sands at Porthcawl, adjacent to Cardiff, on Saturday, July 20th, both under A.C.U. and R.A.C. rules.

Automobile Engineers Visit A.C. Works.

On the 16th instant the Graduates of the Institution of Automobile Engineers paid a visit to the works of Auto-Carriers, Ltd., Thames Ditton. The various shops were visited in turn, and it was explained to the party that the present output of A.C. sociables was fifteen per week, but before very long it was hoped to turn out fifty per week.

The Land's End Run.

A record entry has been received for the above M.C.C. event at Easter. Last year there were 74 competitors, but this year's total is considerably in excess of this number, and the entries were expected to reach a total of 90.

The route has been altered slightly. Instead of going from Exeter to Moreton-Hampstead and Two Bridges on the outward journey, the route is *viâ* Ashburton and then on to Two Bridges *viâ* New Bridge and Dartmeet. This stretch is considered to be the most severe in England.

A.C.C.F. Circuit de Paris.

On page 307 of our last week's issue full particulars were given of the Circuit de Paris. Entries close in England today, but will probably be received up to Sunday morning if telegraphed to the secretary, A.C.C.F., 35, Rue Crussol, Paris. This is the first time that England has sent a motor cycle team to take part in a French trial. Motor cyclists who think of entering will, if the weather be fine, enjoy an experience which will live in their memories. The following English riders have, we understand, signified their intention of competing: G. L. Fletcher (2¾ h.p. Douglas), Rex Mundy (2½ h.p. Singer), H. Reed (Dot), F. Dover (Premier), R. A. Bishop, W. Cooper (3½ h.p. Bradbury), E. B. Ware (8 h.p. Chater-Lea sc.), J. Haslam (Zenith), Cook (3½ h.p. A.S.L.), F. B. Hillman (6 h.p. Zenith), A. Wentworth Heighton (Matchless), F. Kilpatrick (3½ h.p. Rex), E. M. P. Boileau (2¾ Douglas), C. M. Smith (3½ James), W. Bashall, A. Bashall (Humbers), W. G. McMinnies, and T. H. Lake.

Efforts are being made to arrange so that competitors' motor cycles shall be registered through to Paris at the lowest possible rate; this will allow the Customs examination to be made in Paris. It is also understood that saloons will be engaged for the party.

Latest advices from the other side are that our French hosts are anxious to do everything they can to comply with the wishes of English competitors. It is anticipated that a bigger entry will be received than ever before for an International competition.

FUTURE EVENTS

Mar. 30.—Derby and District M.C.C. Open Hill-climb.
April 5-8.—N.W. London M.C.C. & Herts. County A.C. Joint Trial and Open Hill-climb (Yorks.) and Ladies' Competition.
„ 8.—Westmorland M.C.C. Open Hill-climb at Brigsteer Brow.
„ 13.—Oxford M.C.C. Hill-climb.
„ 13.—Liverpool A.C.C. Open Reliability Trial.
„ 20.—B.M.C.R.C. Race Meeting.
„ 20.—Bristol M.C.C. Open Hill-climb
„ 27.—Bristol B and M.C. Open Hill-climb.

American Champion Badly Hurt.

Jake De Rosier has had a serious accident at the Los Angeles Stadium, and has broken his leg in two places, and it is feared his skull may be fractured. This happened on the 10th inst., and we are led to believe that the gallant racer will never be able to mount a motor bicycle again. The accident is all the more unfortunate as the American papers put it down to "dirty" riding. He was competing against Balke, who also fell heavily, but escaped with minor injuries. Both were riding Excelsior machines.

Hill-climbing in Pairs at Oakamoor.

There are 141 entries for Saturday's open hill-climb at Oakamoor, organised by the Derby and District M.C.C., including most of the leading riders. Lord, Brown, and Baxter will be mounted on Rexes, Newsome and Cheshire on Triumphs, Newman (Ivy), J. H. Slaughter (L.M.C.), Holloway (Premier), D. C. Bolton, E. T. Bolton, and W. D. South (Rudges), G. Brough (Brough), and A. Ainsworth (Rudge). Percy Johnson, of Nottingham, has entered for three classes, and hopes to annex the fastest time prize on an 8 h.p. Matchless.

Bad Behaviour at Barnet.

"Anti-Knut" complains that three motor cyclists rode to and fro with cut-outs open in front of Barnet Church last Sunday during divine service. Such behaviour is most reprehensible, and we hope the offenders will not repeat it.

Associated Clubs' Dinner.

The R.A.C. and Associated Clubs' third annual dinner will be held to-morrow (Friday) at the Holborn Restaurant at 7 p.m. Several motor cyclist members of affiliated and associated clubs will be present at this function. Seats have been booked at the Paladium, where the performance begins at 9.30 p.m.

War Office Tests at Brooklands.

Further War Office tests took place at Brooklands on Tuesday last, when a P. and M. was tested in the presence of Lieut. R. H. Verney. The machine ordered had to cover one lap at 40 m.p.h., and nineteen laps at 30 m.p.h. W. Pratt had difficulty in obtaining the maximum speed, but P. Marians, who also rode, covered a lap in 3m. 55s. = 41.63 m.p.h. The weather was fine, but windy.

Post Office Motor Cycles for Melbourne.

Tenders will be received at the office of the Deputy Postmaster General, Melbourne, Australia, up to 3 p.m., May 7th, for the supply and delivery of five 3½ h.p. free-engine motor cycles. A deposit of 5% on the first £1,000 is required with each tender. Local representation is necessary. It would be as well for firms who intend tendering to first of all apply to the Agent General for Victoria, Melbourne Place, Strand, W.C., who will probably be in possession of special tender forms and able to supply further particulars. A point to bear in mind also is that letters take from four to five weeks to reach Melbourne from England, so that tenders should be despatched by the beginning of next month to be in time.

Through the traffic of Luton in the Herts. County Trial last Saturday. The foremost rider is A. G. Edmond (Humber).

CLUB NEWS.

Newport (Mon.) M.C.C.

The season commences with a speed-judging and reliability trial on April 5th. There will be a short Easter tour to Brooklands.

Harrogate and District M.C.C.

To-morrow evening (Friday), Mr. J. L. Norton will lecture on "The Efficiency and Tuning of an Engine" at the Albany Club, Central Arcade, Harrogate, at eight p.m.

Liverpool A.C.C.

On April 5th there will be a penalty run to Kendal, which will be the headquarters for the Easter holidays; as several of the members are competing in the Westmorland club's hill-climb.

Leicester and District M.C.C.

The first round of the Edwards Cup was held on the 7th inst. over a course of seventy-six miles. Result:

		Error.
1.	Cyril Bailey	3m. 52s.
2.	Harold Petty	4m. 19s.
3.	S. O. Judge	5m. 36s.

Thirteen made non-stop runs.

Birmingham M.C.C.

Entries for the Perth and back run at Easter close to-morrow, the 29th inst. This run will be the longest trial ever organised by any affiliated club, the total distance being approximately 360 miles each way. In order to eliminate as far as possible the "luck bogey," there will be only two checks *en route*, at which competitors will be allowed a margin of forty-five minutes early or fifteen minutes late. To qualify for gold medals, competitors must be within one minute late or early at Perth and Birmingham, the respective finishing points of the outward and homeward journeys. Those who wish to compete should communicate with Mr. H. J. Cox, 21, Stirling Road, Edgbaston.

Putney and District M.C.C.

The opening hill-climb was held on Saturday last on Pebble Coombe, when a good entry was obtained. The results were:

3½ H.P. MACHINES up to 550 c.c.

1.	J. Montagu Drew (3½ Zenith)	18⅕s.
2.	J. E. Collbran (3½ T.T. Rudge)	18⅖s.

OPEN CLASS, up to 1,000 c.c.

1.	E. Collbran (3½ T.T. Rudge)	16⅘s.
2.	G. S. Drew (6 Zenith)	18s.
	Montagu Drew (3½ Zenith)	18s.

Members wishing to join the Easter tour to Devon should inform the hon. secretary.

Walthamstow M.C.

The opening run will take place on March 31st, starting at 10.30 from the Napier Arms, Woodford.

Cathcart District M.C.C.

The opening run of the season took place on Saturday, the 16th inst., when there was an excellent turn-out of over thirty members. On Saturday, the 30th inst., the club run is to Strathblane.

Mersey M.C.

Starting at 8 p.m. on Friday, May 3rd, from Liverpool, a twenty-four hours open trial will be held for motor cycles and cyclecars. Route: Birkenhead, Chester, Wellington, Worcester, Llandrindod Wells, Lake Vyrnwy, Beddgelert, Capel Curig, Ruthin, Queensferry, and Birkenhead. Hon. Sec., Mr. S. W. Carty, 5, Redcross Street, Liverpool.

Cork and District M.C.C.

The reliability trial, Cork to Killarney and back, was held on Monday, 18th inst., over very bad roads. Result:

		Marks.
1.	M. J. Fitzgerald (3½ Bradbury)	98%
2.	R. S. Russell (3½ Matchless)	94½%
3.	R. Atkinson (3½ Triumph)	76%
4.	W. J. O'Callaghan (3½ Zenith and sc.) ...	67%

O'Callaghan won the special sidecar prize.

Manchester M.C.

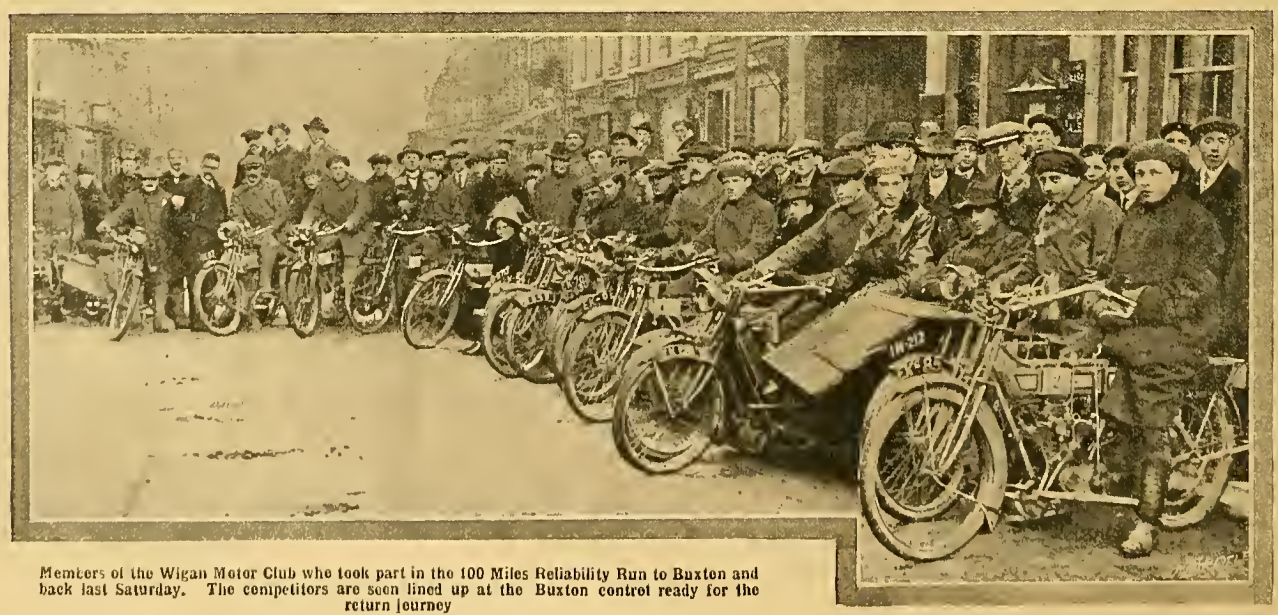
The opening run of the season took place on Saturday, March 23rd. There was a large attendance of members, but unfortunately the weather conditions were anything but favourable, rain falling for most of the afternoon and evening. The meeting place was the Nag's Head Inn at Bucklow Hill, and the run was by way of Northwich to Sandiway.

Wolverhampton M.C.C.

The club held a most successful reliability trial on the 16th and 17th inst., to Colwyn Bay and back.

Competitors were allotted 500 marks, and for each second out at controls one mark was deducted. Non-stop conditions were strictly observed.

1st prize, club gold medal, and a week's stay at The Connaught, Colwyn Bay: R. Tonks (3½ Multi Rudge); marks lost, 214.



2nd prize, club gold medal: B. Haddock (2½ A.J.S.), two-speed; marks lost, 216.

3rd prize, club silver medal: J. Stevens (2½ A.J.S.), two-speed; marks lost 251.

1st prize (sidecar), club gold medal: R. Lord (6 Rex Sidette); marks lost, 316.

1st (amateur): H. M. Weir (2½ A.J.S.); marks lost, 382.

2nd (amateur): H. Wolverson (4 Ireland); marks lost, 450.

Members of the Wigan Motor Club who took part in the 100 Miles Reliability Run to Buxton and back last Saturday. The competitors are seen lined up at the Buxton control ready for the return journey

Club News.—

Westmorland M.C.C.

Entries for the Easter Monday open hill-climb close at the end of this month.

The membership of this club now stands at 126.

Sutton Coldfield and Mid-Warwickshire A.C.

The opening run on April 13th will take the form of a speed-judging competition for cars and motor cycles from headquarters to Kenilworth, where tea will be provided at the Abbey Hotel.

Cork and District M.C.C.

The forthcoming events include: April 5th, open hill-climb; April 5th and 8th, tour to Killarney; April 8th, open reliability trial, Killarney to Cork; May 1st, flexibility hill-climb; May 27th, open reliability trial; June 19th, race meeting at Garryvoe Strand; July 3rd, passenger hill-climb; August 5th, novices' reliability trial.

Birmingham M.C.C.

The opening run to Evesham was on Saturday, the 16th inst. Some thirty members and friends turned out notwithstanding the cold and threatening weather. The Perth reliability trial at Easter promises to be a success. All who complete the course within seventeen and a half hours will be awarded gold medals.

Wakefield M.C.C.

It has been decided to affiliate this new club to the A.C.U. and R.A.C. Headquarters: Grazier's Hotel, Wakefield. Hon. secretary, Mr. C. Hirst, 3, Welbeck Street, who will supply all information. Hon. treasurer, Mr. J. W. Brown. Catalogues and booklets will be gratefully received.

Aberavon, Port Talbot, and District M.C.C.

The opening run will take place on April 5th, starting from Bethany Square, for Tintern Abbey and Chepstow, return *viâ* Monmouth and Raglan.

On Easter Monday a nine hours' reliability trial will take place. The route will be through Mid-Wales.

Full particulars from the hon. secretary, Mr. J. H. Locke, 51, High Street, Aberavon.

Bristol B. and M.C.

The Bristol Bicycle and Motor Club will carry out their second open hill-climb (A.C.U. permit) near Bristol, on April 27th, when Mr. F. Straight (A.C.U. secretary) will act as timekeeper. There will be nine events, and no restriction has been placed on gears. In addition to the small engine, touring, and racing classes, there are events for ladies' and passenger machines, while a class is specially set apart for amateurs. Entry forms are now ready, and may be had from Mr. H. Blocksidge, 14, Frederick Place, Clifton.

Halifax and District M.C.C.

The club met on the 17th inst. for the inaugural run to Ilkley, *viâ* Silsden. Although the weather was not good, twelve sidecars and six solo machines took part.

Finsbury Park C.C.

The Easter tour in Normandy. The start will be from headquarters at 5 a.m., the boat leaves Newhaven at 11-30 a.m. Friday evening will be spent in Dieppe, the two following days in trips to places of interest and the return will be on Easter Monday.

Herts County A.C. (Motor Cycle Section).

A members' hill-climb for the motor cycle section will be held on the 30th inst. There will be fourteen classes. Entries and enquiries should be addressed to Mr. E. A. Colliver, Chaulden, Boxmoor, Herts.

Brookdale Club (Catford).

The opening run will take place on the 31st inst., destination Brighton. A 100 miles reliability trial will be held over a Kent course on Easter Monday, including a twenty miles non-stop portion with Westerham being taken on the run.

Canterbury and District M.C.C.

A hill-climb was held on Barn Hill, Wye, on the 14th inst. Results:

CLASS I.—For members who have not won a prize.

		Formula.
1.	G. Crump (3½ h.p. Rudge)	314
2.	A. Clark (3½ h.p. T.T. Triumph)	274
3.	P. Kingsford (3½ h.p. Triumph)	254

CLASS II.—Handicap.

		Time.
1.	T. Timson (3½ h.p. T.T. Rudge)	44⅖s.
2.	C. Stephenson (3½ h.p. Brown)	45⅕s.
3.	G. Crump (3½ h.p. Rudge)...	45⅗s.

CLASS III.—Flexibility Test: Greatest difference between fastest and slowest times.

		Difference in time.
1.	T. Timson (3½ h.p. T.T. Rudge) ...	1m. 56⅘s.
2.	E. Dean (3½ h.p. Bradbury)	1m. 36s.

A. Clark (T.T. Triumph, 2m. 12⅗s.) was disqualified for breaking the tape with his engine not firing, and stopping a few yards from the start. He was allowed to ride a trial, subject to the matter going before the committee.

CLASS IV.—Sidecars.

		Formula.
1.	G. Crump (3½ h.p. Rudge)	313
2.	J. Poxon (3½ h.p. Bradbury)	204

The formula used is equivalent to that recommended by *The Motor Cycle* last autumn, and gives much more satisfactory results than the A.C.U. formula.

UNNERVING A COMPETITOR.

The above is a frequent scene in hill-climbs which has led to many an accident. We refer to competitors descending the hill before all the others in that class have ascended; though, in fairness to those competitors depicted, it should be mentioned that they are well clear of the course

Questions & Replies

A selection of questions of general interest received from readers and our replies thereto. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal queries should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Improving a Silencer.

I am thinking of fitting a long pipe to my 3½ h.p. Humber motor cycle. I do not intend doing away with the silencer. If I decide to have it fitted would it increase the power of the engine? Would it make the engine more silent?—G.A.C.L.

The best way to do this would be to use the existing silencer as an expansion chamber, and to remove therefrom all baffle plates and bring your long pipe from this silencer to the rear of the machine. The long pipe will increase the power, but without the expansion chamber would make more noise.

Aylesbury to Hoylake.

I intend making a trip from Aylesbury to Hoylake with my four-cylinder F.N. and sidecar (single gear), and shall be much obliged to you if you will kindly let me know the best route avoiding large towns. Please give me the mileage.—H.S.P.

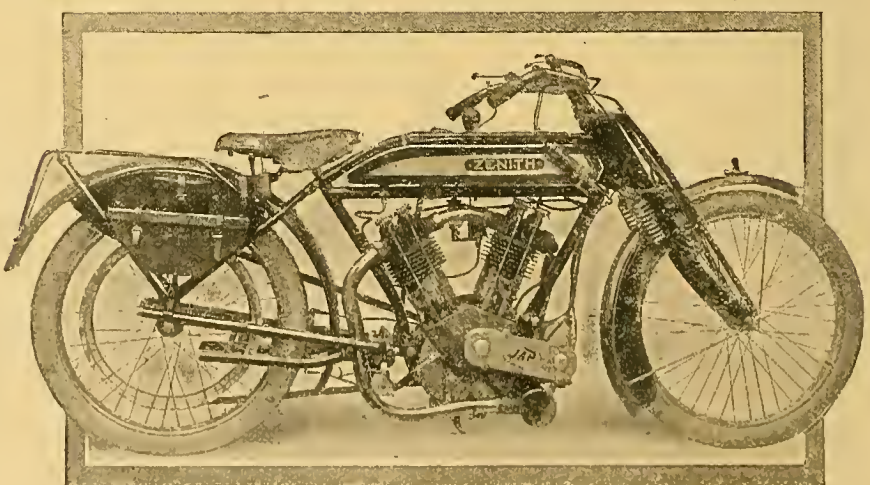
We have pleasure in giving you the following route: Aylesbury, Winslow, Buckingham, Towcester, Weedon, Daventry, turn right for Watling Street till you reach a point two miles south of Lichfield, go through Lichfield, Rugeley, Weston, Stone, Pipe Gate, Nantwich, Tarporley, Chester, to Hoylake. The distance is approximately 172 miles.

Congleton to Wells (Norfolk) and Back.

Will you kindly give me the best route from Congleton to Wells (Norfolk)? What is the distance? On the return journey, could I adopt a different route without making a very great difference in the distance I should have to travel? If so, would you kindly give me a route for the return journey?—M.S.

Your best route would be as follows: Congleton, Leek, Ashbourne, Derby, Nottingham, Bingham, Grantham, Donnington, Holbeach, Long Sutton, Lynn, Fakenham, to Wells. You may return by a slightly different route: From Wells, through Burnham Market, Flitcham, Lynn, Wisbech, Peterborough, Wansford, Uppingham, Leicester, Ashby-de-la-Zouch, Burton, Tutbury, Uttoxeter, Cheadle, Leek, to Congleton. The distance is approximately 164 miles for the outward journey and 176 miles for the return journey.

A Country Doctor's Requirements.



As a middle-aged country practitioner, living in a hilly district, and finding that my powers as a cyclist are not what they once were, but otherwise feeling fit and well, I feel driven to the necessity of considering whether a motor cycle will help me out of my difficulty. Before doing so, I would feel obliged by your assisting me in the following queries: (1.) Is the modern motor cycle reliable? (2.) Is it good value for the money? (3.) Can its driving be easily learned by a cyclist? (4.) What would it cost annually to insure with a first-class insurance company against third party risks, fire, theft, and damage by accident? (5.) What are the advantages of membership with a Cycle Union, preferably in Scotland?—ARRAN.

(1.) The modern motor bicycle is quite reliable. (2.) If you buy a machine of good reputation it is good value for the money. (3.) Its driving can be learned quite easily. (4.) You may reckon the upkeep to be about ¾d. per mile for a 3½ h.p. machine; rather less for a lightweight. The cost of insurance is, roughly speaking, £1 10s. to £2 per annum. (5.) There is no purely motor cycling body in Scotland. Probably your best plan would be to become a motor cycle member of the Scottish Automobile Club; secretary, Mr. R. J. Smith, 163, West George Street, Glasgow.

Cost of Running a Lightweight.

(1.) How many miles per gallon does a 2½ h.p. Singer (three-speed F.E.) run? (2.) Could the above engine be started with back wheel on the ground? (3.) Is it necessary to push out the clutch to change the gear with the Armstrong three speed? (4.) What cycles are fitted with the "Lukin" carburetter? Lately in *The Motor Cycle* I have seen balance sheets, as regards cost of running a motor cycle, but I have never yet seen the cost of running a lightweight, most of them being 3½ h.p. machines. I should very much like to see the balance sheets of a few riders of 2½ and 2¾ h.p. machines.—D.P.J.

(1.) It depends upon the roads and how the machine is driven, but you should get about 120 miles per gallon. (2.) No, not with the Armstrong three speed. (3.) It is advisable when changing up unless you raise exhaust, but not necessary when changing down. (4.) We do not know of any motor cycle which is fitted with a Lukin as standard. The Lukin is at present made to fit any single-cylinder engine in place of the B. and B. without alteration. (5.) A lightweight should cost about one-third less to run than a 3½ h.p. machine. We are discontinuing this feature for a time, having published a good many pages on this subject.

A new 8 h.p. twin Zenith with overhead valve J.A.P. engine, used by F. W. Barnes in the last open hill-climb. This is the type of engine holding the world's motor cycle speed record.

Motor Cycle Camping.

Where can I obtain a light folding portable tent, such as is used by cyclists, and a ground cloth? What kind of stove or heating apparatus would you advise as being most suitable for a camping tour (preferably to burn petrol)?—G.K.

What we should advise you to do is to get into direct communication with the secretary of the Cyclists' Camping Association, Mr. A. P. Moeller, 6, Duke Street, Adelphi, W.C., who will supply you with full particulars. We understand that Messrs. John Piggott, Ltd., 117, Cheapside, E.C., also make a speciality of motor cyclists' camping outfits.

Adjustable Pulleys and Belt Slack.

Please give your opinion on the following points: (1.) Which is the better machine for sidecar work, Triumph or Rudge? (2.) Is it necessary to have a variable gear? (3.) Is the clutch likely to get out of order in the free engine models? (4.) When lowering gear (adjustable pulley), what becomes of the belt slack? Is it necessary to have two belts?—TRUDGE.

(1.) It is against our rule to differentiate between various makes of machines. Both are excellent. (2.) It is advisable to have a change-speed gear. (3.) The clutch will not get out of order if properly used. (4.) It is better to have two belts or an adjustable fastener, if the gear is lowered to any appreciable extent.

A General Overhaul.

(1.) I intend fitting a long exhaust pipe to my 5 h.p. twin Peugeot motor cycle, bringing it back to the back stays. What metal would you advise—brass or copper—and what gauge? (2.) What speed ought I to get out of this machine geared 4 to 1? (3.) What is the best place for the plugs on this engine? I find I can fit them in the compression tap orifice. Would this be better than at the side? (4.) I have a pair of Le Lion (French) 26 × 2½ wired covers. Are these likely to give trouble? I have no security bolts? (5.) Do you think I should benefit by fitting the N.S.U. two-speed as regards petrol consumption by coasting down hills? (6.) I have fitted a 1911 B. and B. What size jet would be suitable for this engine? (7.) What mileage ought I to do to the gallon of petrol? (8.) What distance should there be between platinum points on magneto (Bosch) when open?—F.W.

(1.) Neither brass nor copper would suit. These do not stand heat well. Fit a good steel pipe which is not too heavy. (2.) You ought to get about fifty miles an hour. (3.) It would always be better to fit the plugs at the side of the cylinder. (4.) If your rims are suitable there is no reason why the tyres in question should not be satisfactory without security bolts. (5.) You would undoubtedly get great benefit by fitting a N.S.U. two-speed gear. However, this would not affect your petrol consumption appreciably. (6.) The jet should be .031, commonly called No. 31. (7.) You ought to run about fifty or sixty miles to the gallon of petrol. (8.) The distance should be .4 mm.

Carburetter Adjustment.

(1.) Why is it necessary to cut off most of the air in order to start a motor cycle? (2.) In theory, apparently, there is a perfect mixture for all speeds and under all conditions. I imagine that there is one proportion of air and petrol which makes the most explosive mixture. (3.) Why then, in order to climb a hill, does one cut off the air? Is it that on the level one does not use the mixture which gives the most power? (4.) But if so, why should cutting off the air cause knocking? (5.) Would you also let me know if it is possible for an automatic carburetter to be so perfect that, besides mixing the gas, it does away with the necessity of advancing and retarding the spark? (6.) I have a 2¼ h.p. F.N., with automatic carburetter. Everything is in perfect order, but on a cold morning it will not start without five minutes' pedalling. Do you think if I fitted a cap over the air intake so as temporarily to strengthen the mixture it would start easier?—V.M. (Liège).

(1.) It is necessary to cut off the extra air at starting to obtain a correct mixture because when the piston speed is slow the suction on the jet is slight, and, consequently, much less petrol is drawn through than at higher speeds. (2.) This is quite true. (3.) For the reason just given. You do not close the air until the speed falls; also, as you suggest, one often runs on the level with the mixture on the weak side, giving all the air the engine will take. (4.) Cutting off some of the air stops knocking because it gives a mixture on the rich side which does not explode so quickly, and is, therefore, tantamount to retarding the spark. (5.) It is possible for an automatic carburetter to be so perfect that all air adjustment is unnecessary, but control over the ignition is very desirable at times. (6.) Most certainly.

Freight and Duty to Vancouver.

Would you be good enough to let me know the cost of the carriage of a motor cycle to Vancouver, and shall I have to pay any import tax? Will it be necessary to renew my licence and register it afresh?—G.L.W.

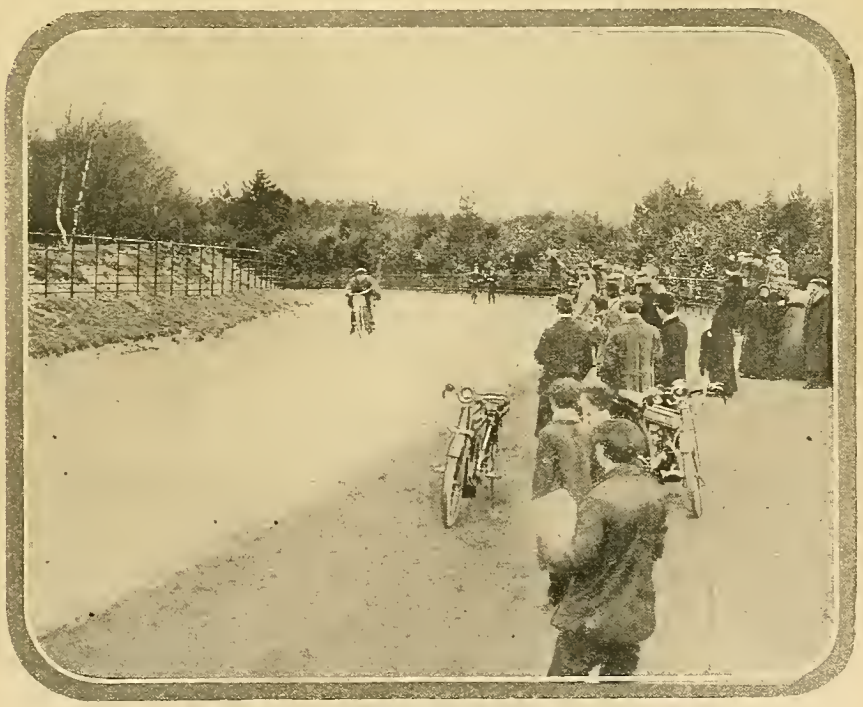
The cost of sending a machine to Montreal or Quebec would be 35s. 6d. From there to Vancouver you would have to apply to the Canadian Pacific Railway Company (62-65, Charing Cross, W.C.), for the cost of transport, or you could get a quotation for forwarding it direct from Messrs. Davies, Turner and Company, Limited, International Carriers, 52, Lime Street, E.C. The duty to Canada is 28% *ad valorem* if of British manufacture, or 35% *ad valorem* if of foreign manufacture. You will probably have to take out fresh licences when you get out there.

EXPERIENCES WANTED.

"C.W.C." (Bayswater).—Whittle or other belt suitable for a 3½ h.p. Zenith.

"D 347."—Dunkley sidecar.

"J.F.B." (Horsham).—5 h.p. Stevens, with and without sidecar.



"W.H.B." (Watford).—D.H.K. or Mabon clutch on 2¾ h.p. machine.

"A.W.B." (St. Albans).—L.M. cyclecar. Reliability, hill-climbing, and speed.

"T.A." (Wallingford).—Mabon variable gear, N.S.U. two-speed gear; Gloria, Millford-Radial, and castor spring wheel sidecars, all for free engine 1912 Triumph.

"R.M.R." (Tring).—Rollo cyclecar.

"R.M." (Dunfermline).—Mabon clutch on 3½ h.p. engine.

ESSEX M.C. OPEN CLIMB AT ASTON HILL.

The first open hill-climb of 1912 did not attract such a representative entry as was anticipated, though good sport was witnessed. Our illustration is of a competitor at the top bend.

One Million Magnetos.

It is a matter of some historical interest that the millionth magneto manufactured by the Bosch Co. has just been received at the London headquarters in Newman Street, W.

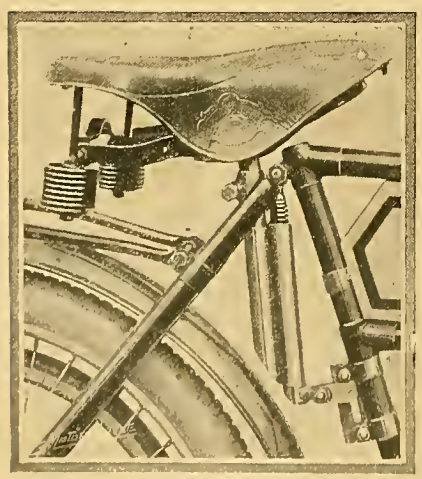
Trade Announcement.

In view of pending litigation raised by Bowden Wire, Ltd., against the Bowden Brake Co., Ltd., of Birmingham, Messrs. James R. Nisbet and J. Dring, who were directors of both concerns, have resigned their directorships of the Bowden Brake Company.

Tyre Successes.

C. R. Collier used Hutchinson tyres for his ascent of Honister Pass. The same make of tyres were also used by the first competitor in each class of the Essex M.C. hill-climb on the 16th inst. B. Alan Hill (7 h.p. Indian), who made fastest time of the day, also used Hutchinson tyres.

Efficiency.



As an example of the power developed by the modern 500 c.c. engine, it may be noted that in the Essex M.C. open hill-climb Holloway's 3½ h.p. Premier made considerably faster time than twins of infinitely greater capacity. In fact, his time was only beaten by two machines, one of 7 h.p. and one of 8 h.p., and in each case by under two seconds.

Leggings for Lady Motor Cyclists.

Messrs. Rogers, Browne, and Richard, Ltd., 23, Jewin Street, E.C., the manufacturers of Autoclos, now obtainable at the depot of the Service Co., Ltd., have lately introduced leggings for lady motor cyclists, fitted with the Lightning fastenings described and illustrated in *The Motor Cycle*. A pair of these, which are beautifully made, have recently been supplied to Miss Hough, the well-known Douglas lady rider.

A New Spring Seat-pillar.

Hunt's patent spring seat-pillar, illustrated herewith, is suitable for fitting to existing machines, and enables a slightly lower saddle position to be adopted, if wished for. The component parts are few in number, and consist of one piece

of 8 section tube, one plunger and nut, two springs, and a slide which is attached to the down tube by means of clips. Springs of varying strength are fitted suitable to the weight of the rider.

SPARKLETS

Ladies' Mackintosh Costume.

The accompanying photograph is that of Mrs. A. B. Wade, of Cardiff, who is seen wearing a new mackintosh costume. Mrs. Wade informs us that for motor

Mrs. Wade wearing a new mackintosh costume.

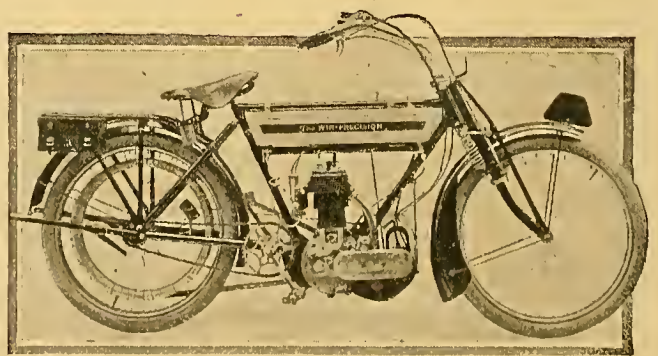
cycling and walking it is far superior to an ordinary mackintosh, and the unique fastening of the skirt is the means of getting the costume off and on in a minute's time. It is made and sold by Messrs. Burrelli, Ltd., 2, Albany Road, Cardiff.

Catalogues Received.

The 1912 booklet of the P. and M. motor cycles is a very tastefully-arranged catalogue. In the introductory chapter, illustrations are published of the first P. and M. motor bicycle and the 1912 model on the same page, clearly showing that the principle of the original design first introduced in 1900 remains unaltered today. In addition to excellent half-tone illustrations of the various models, the catalogue contains instructions as to driving, management, and adjustment of these machines. Copies can be obtained on application to Phelon and Moore, Ltd., 4, Percy Street, Tottenham Court Road, London, W.

The Scott is an interesting machine at all times, therefore the 1912 catalogue should appeal particularly to our readers. All the Scott features are well illustrated and described, not the least interesting feature being the chapter on "The Scott Ideals," which should be read by all who are interested in two-stroke engines. The cover and some of the letterpress are in the well-known T.T. Scott colour, which Frank Philipp made popular in the Isle of Man last year. Copies can be obtained from the Scott Engineering Co., Mornington Works, Bradford.

The catalogue issued by Mr. J. Kirby, Broadgate, Lincoln, commences with a few notes on the history of the Lincoln Elk; then follow complete specifications of the several models, a list of spare parts, and line drawings and descriptions of the two-speed gear and clutch. The latter is operated by a contracting bronze band.



New Motor Cycle Tyre Firm.

The firm of Pirelli, Limited, 45, Basinghall Street, E.C., well-known as car tyre manufacturers, are specially turning their attention towards the motor cycle tyres. These are made in all standard sizes of the leather and steel-studded and plain ribbed types. Pirelli tyres are well-known for their excellent workmanship and wearing qualities.

We also have to acknowledge receipt of a pamphlet entitled "Pirelli and Company: 40 Years of Industrial Life," which contains some interesting facts concerning the Pirelli works. It is well got up, well illustrated, and well worthy of perusal.

Another Hand Cleaner.

We have received samples of Hopol pumice soap, manufactured by Messrs. Hopol, Ltd., Carntyne Chemical Works, Shettleston, Glasgow. The preparation is milled toilet soap containing a special grime dissolving solvent, pumice stone ground to a fine powder, and an antiseptic. The soap is claimed to give a lather containing these various grime removers, which quickly cleans away the oil and grease collected during repairs and adjustments. It is sold by the Service Co., Ltd., 292-293, High Holborn, W.C.

3½ h.p. 1912 Win-Precision. This—the latest production of the Wincycle Trading Co.—has Druid forks, Bosch weatherproof magneto, B. and B. carburettor, and Dunlop tyres.

my mount's an

A.S.L'

Absolutely the most comfortable of all motor cycles. You feel no vibrations whatever. All shock is absorbed into air-springs or cylinders fitted to the front and back of the machine, which can be inflated like an ordinary tyre. The rider is literally

"Riding on Air."

Its reliability was proved in the recent London—Exeter run.

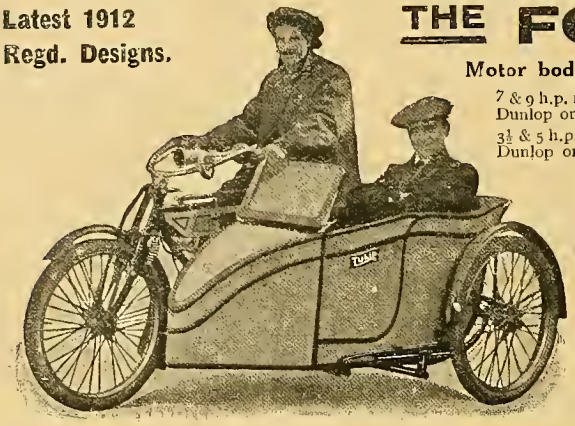
Motor Cyclists and Repairs.

Now that winter is over, there are many motor cyclists thinking — some of buying a new machine, some of putting their present one in condition after its long disuse in the winter, and others surveying the wear and tear of their past mud-plugging, dolefully thinking of bills for repairs and replacements to come.



Our advice to all the above is to install in their own garage a handy little lathe such as illustrated here, and set to work on their own repairs. It is not difficult, it is interesting, it is cheap, and we help if you get stuck.

This lathe is £5, and can be had on the easy payment system. We will gladly send particulars.

Once Used

RICH'S PATENT — DETACHABLE TUBE — FREE CIRCULATION OF AIR — NOT BUTT ENDED

ENDLESS
OR BUTT ENDED
TUBES FITTED WITH THE
RICH DETACHABLE JOINT

Price:

1¾	2	2¼	2½	3	3½	Pedal	Tandem
3/6	5/6	6/-	6/6	8/-	8/6	1/9	2/-, 2/6

Save you pounds during the season. Send tube with size. Returned same day. Cut your tube nearly opposite the valve, or at a damaged part.

Always Used

PUNCTURES HAVE NO TERROR
when you use

The RICH Detachable AIR-TUBES

ADVANTAGES. By carrying a spare tube you can—

Replace tube in five minutes without unscrewing a nut on the machine. Repair at your convenience. Put a patch on the inside with ordinary rubber and solution which never shifts or leaks; no expensive prepared patches required, thereby saving time, trouble, and expense, also prolonging the life of tube and cover. No friction of patch on canvas of cover. Take the valve out and replace from the inside without interfering with valve seating. (All tubes are valve seated on the inside). Turn tube inside out like a stocking by taking the valve out. Take tube to the water for testing without taking machine.

WHY they are the BEST and CHEAPEST.

BECAUSE—They are made of the **BEST** rubber and of substantial thickness. Have free passages of air, and NO butt-ends to burst. Save you hotel and train expenses. Enables you to keep an appointment. No need to repair by the roadside and keep your friends waiting. Lasts longer than any other tube. Saves your tyre bill.

FIRST IN 1904, FIRST ever since.
GUARANTEED AIR-TIGHT.

Pedal Cycle, 1¼, 1⅜, 1½, 7/- Tandem, 1⅝, 1¾, 8/6

Don't go by the first cost, but by the money you save in using them.

IMPORTANT.

We draw special attention of the trade and users of our tube, to turn the female end, No. 1, in before joining, also to use a *small quantity* of our lubricant on the male end, No. 2—a little moisture will revive this when once used. Our tubes are often condemned through these omissions. See that you get the instructions, lubricant and correct size.

Don't spoil your Tour by delay with punctures. Carry a Spare.

If you cannot obtain them from the Trade, write direct. Sent per return post.

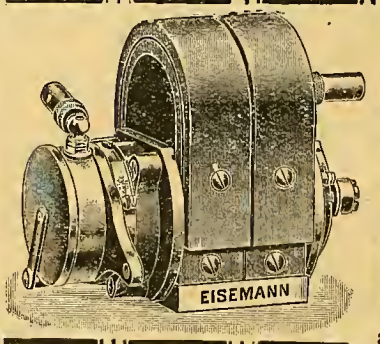
STERNOL

The Standard of Excellence

Sternol Motor Oils set the standard for quality and results. Some of the reasons why YOU should use Sternol are: By doing so you reduce running expenses; better lubrication is secured at less cost (because Sternol is so economical); the engine runs cooler and gives out full power; and your Motor Cycle lasts longer because there is less friction and wear.

STERNOL



KING of MOTOR OILS

retain their full lubricating qualities at high temperatures. Harmful chemical changes, carbon deposit, excessive smoking, hot bearings, etc., do not occur. Each grade of Sternol Oil or Grease is "just right" for its particular purpose.

Ask any good Agent for Sternol Oil or Grease, or write for full particulars stating requirements to

"STERNOL"
(The Stern Sonneborn Oil Co., Ltd.),
50, Royal London House,
Finsbury Square, London, E.C.

HILL-CLIMBER

In the

ESSEX M.C. OPEN HILL CLIMB

Mr. D. S. Kapadia (an amateur), with 8 h.p. de Luxe REX-J.A.P. and Sidecar, made second fastest time and won

THREE SILVER MEDALS.

This machine was absolutely standard in every respect, exactly as specified in our Catalogue, and illustrated above :: :: ::

ALSO remember that in the Midland Open Reliability Trial on February 17th, a 6 h.p. REX-J.A.P. and Sidecar, with a driver who had never been in competition before, made a Non-stop and won Silver Medal, making exceptionally fine climbs on Sunrising and Warmington Hills.

We leave it to the public to judge as to which gives them the best proof of the capabilities of a Motor Cycle—performances such as above, or those made by an expert Trade Rider, with a Special Machine and Sidecar.

Catalogue free upon request.

2½h.p. Triumph, J.A.P. engine, in thorough good order; £7/10.—Plastow, Grimsby.

TRIUMPH, 1910, F.E., in excellent condition; £37/10.—Plastow, Grimsby.

DOUGLAS, 1911 Model E., 2-speed, F.E., handle starting, footboards, ridden 2,000 miles; £37/10.—Plastow, Grimsby.

TRIUMPHS, in stock.—T.T. roadster, £50; free engine, £55.—At Woodgate's, Small Heath.

SINGERS, in stock.—2¾h.p. T.T., £39; 3½h.p. T.T., £48/15; 3½h.p., free engine, £55; 3½h.p., Armstrong 3-speed, £58/15; 4h.p., 2-speed, bracket gear, £65.—At Woodgate's, Small Heath.

ROYAL Enfields, in stock.—2¾h.p., 2-speed, £52/10; 6h.p. sidecar combination, J.A.P. engine, coach-built, £84.—At Woodgate's, Small Heath.

RUDGE-WHITWORTHS, in stock.—3½h.p., T.T., £48/15; 3½h.p., free engine, £55.—At Woodgate's, Small Heath.

ARIELS, in stock.—3½h.p., roadster, £45; 3½h.p., T.T., grey, with Armstrong gear, £59/10.—At Woodgate's, Small Heath.

SECOND-HANDS, in stock.—Properly tuned and ready for the road; include 3½h.p. 1907-10 Triumph, £23; ditto, free engine, £26; 1910-11 Triumph, £36, very fine machine; June, 1911, T.T. Ivy, £35; 1910 T.T. Ariel, £34; 5-6h.p. twin Rex, new condition, 2 speeds, £30; and various others down to £8. Let me know your requirements, I can fit you up at any figure. Canoelet and J.J.W. sidecars in stock, prices from £3/10. Speedometers, lamps, and horns of all makes, and every accessory for the motor cycle in stock at J. J. Woodgate's Motor Cycle Depot, Coventry Rd., Small Heath, Birmingham. 'Phone: 372 Victoria.

DOUGLAS, late 1910 model, new 1911, good order throughout; £27.—Main, 36, Parade, Leamington.

SINGER Lady's Moto-Velo, new, slightly soiled; £28.—Main, 36, Parade, Leamington.

2h.p. Humber, 1911, good as new; £27.—Main, 36, Parade, Leamington.

3½h.p. T.T. Rex, complete with lamp, horn, etc.; £20.—Main, 36, Parade, Leamington.

3¼h.p. Ariel, B. and B., lamp, magneto, tyres good; £16.—Davis, 3, Oxford St., Nottingham.

MODERN 5h.p. 2-speed Model, with or without sidecar; about £45.—26, North Gate, Harborne.

B.S.A., standard, not done 1,000, accessories, spares, perfect; £38.—214, Fosse Rd. North, Leicester.

HUMBER, 2h.p., lightweight, excellent order throughout; £25.—Evans, 358, Stratford Rd., Birmingham.

ZENITH, 3½h.p., 1911 model, with handsome Montgomery sidecar, Lucas lamp, spares, etc., £50, complete.—P. J. Evans, 358, Stratford Rd., Birmingham.

CLYNOS Still Leading.—Immediate deliveries from stock guaranteed, also weekly deliveries; exchanges.—P. J. Evans, Sparkhill, sole Birmingham agent. Telephone: 13 Victoria.

1911¼ N.S.U., 3½h.p., 2 speeds, free engine, as new; cost £55, bargain, £40.—72, Oval Rd., Gravelly Hill.

1911 Rex, 3½h.p., clutch model, in perfect order and condition; sacrifice £30.—37, Clarendon St., Coventry.

BRADBURY, 1911, July, done under 2,000 miles, like new; £36.—H. E. Bonsford, Exhall Court, Alcester.

BRADBURY, 3½h.p., 1909¼, perfect condition for Easter tour; sacrifice £23/10.—471, Gillott Rd., Edgbaston.

LADY'S Motosacoche (1910), magneto, free engine, excellent condition; £22.—Nell, Merrie, Athol Villa, Bourne.

1912 Triumphs in stock, Douglas, B.S.A., Bradbury, Rudge, Zenith; offers.—Clifford, Eastwood, Notts Exchanges.

1912 Bradbury, Rudge, B.S.A., Alldays, New Hudson, 2¾h.p. and 3½h.p. 3-speeds in stock.—Blackburn, Spalding.

1912 Triumph and New Hudson, 3-speed, clutch, and standard, in stock.—Mason, Triumph agent, Wellingborough.

1911 Humber Lightweight, very little ridden, splendid condition; accept £25.—Kerby, 14, Little Park St., Coventry.

TRIUMPH, 1908, new tyres and tubes, recently overhauled, all accessories; £28/10.—Apply, Hatwell, Ratcliffe, Atherstone.

KERRY-ABINGDON, 1911, free engine; £39, or nearest; any trial; buying 1912.—134, Anderton Park Rd., Moseley.

1911 7h.p. Indian, free engine, racing and touring handle-bars, new tyre on back, perfect condition; cash offers. Also

5h.p. Twin Peugeot and Sidecar, just overhauled and enamelled; £31.—Apply, F. Miles, 42, Spon St., Coventry.

ZENITH, 3½h.p.; doctor forbids riding; not yet ridden; £55/13.—Address, No. 75, *The Motor Cycle* Offices, Coventry.

A Mobilisation Scheme.

TWO thousand motor cyclists mobilised in one Midland town! That is what we may expect to see in the near future, if the scheme proposed by the writer of the military notes in this issue become an accomplished fact. It is suggested that riders from all parts of the kingdom should show our military authorities what can be done by motor cyclists in the way of rapid mobilisation. The Legion of Cyclists, a body already in existence and with offices in Piccadilly, W., will on a certain Friday night send postcards to all motor cyclists who are willing to help and have previously registered their names and addresses with the secretary of the Legion, calling on them to report themselves to the officer commanding at a conveniently situated Midland town. These postcards will be sent to reach the riders by the first post on Saturday. Prizes will be awarded to those who have, in the opinion of the officers in charge, accomplished the best record. The time of starting must be verified, and we presume, in awarding the prizes, the distance travelled and the difficulties overcome, such as traffic and hills, will be taken into account. Other points that will require the attention of the umpires are the power and size of the engine, and whether a roadster, T.T., or racing machine be used. The only impedimenta the motor cyclist will be required to carry are an overcoat or blanket, food for twenty-four hours, and a change of underclothing. This scheme strikes us as a particularly good method of proving to those concerned what would be possible in the event of an invasion, and the plan will doubtless work admirably. But we wish to urge strongly upon riders the desirability of proceeding at a strictly moderate pace in towns, villages, and, in fact, in any place where high speed is likely to cause danger or inconvenience to others, or to bring them into conflict with the civil authorities.

From another source we learn that the War Office have no intention of founding a motor cyclists' corps as part of the regular army; and the machines they have ordered are merely to be used by subalterns in connection with assisting the Army Service Corps in the transport of impedimenta used by an army on the march. The motor cycle mounted subalterns act as guides, etc., to the mechanically propelled lorries. The War Office evidently do not look seriously on the motor cycle as a fighting or scouting mount, although there are leading lights in the military world who are most anxious to make use of its services. It is, therefore, the duty of motor cyclists who have leanings towards military work to enrol themselves members of the new Legion, and show by united action what they are capable of in the direction of rapid concentration on one particular spot, even at a considerable distance from home.

We have only two suggestions to offer to those who are desirous of enrolling motor cyclists in this Legion: they are to ask applicants to state the date, horse-power, and make of their motor cycles—it would be detrimental to the object in view to enrol riders possessing antiquated or unreliable machines—and to consider the question of providing all motor cyclist members of the Legion who intend to take part in the ride with a distinctive armlet so that they may be allowed a certain amount of leniency in regard to speed for this special occasion, should they happen to come under the eye of the police.

COMPRESSION RATIO.

WHAT IT IS AND HOW TO CALCULATE IT.

IF there is one thing that the average motor cyclist, practical and fond of acquiring first hand knowledge though he be, is thoroughly hazy about, it is the compression ratio of his engine. If you were to ask him off-hand what this quantity was, it is a thousand to one that he would give you a figure far wide of the mark if he gave you an answer at all. The fact of the matter is that the average motor cyclist regards compression as an exceedingly useful and valuable commodity with which he prefers to get acquainted only sufficiently to know it by a sense of touch on an engine belt pulley. He doesn't know by any means how much resistance his wrist ought to meet with in trying to urge, through the crankshaft, the piston over its compression stroke. If he has a twin engine he can tell you, without any sort of doubt at all, which cylinder has the better compression, because in relative matters such as this the sense of touch is a tolerably good guide, but if, after you had watched him testing the compression in the usual way, you asked him what it was in pounds to the square inch, he would be undoubtedly puzzled. Inasmuch as the compression ratio of most motor cycles is about the same, nearly every motor cyclist can without difficulty carry about with him a mental idea of what standard compression should be.

The Advantage of Knowing the Compression.

Now, one of the joys which only the keen motor cyclist relishes is that which pertains to the art of "tuning up." Everyone who takes an intelligent interest in his engine likes to know the conditions under which it is working, and furthermore likes to improve these conditions and so get better results if he can possibly do so. The question of the compression ratio is an important factor in the horse-power output of an engine and hence it is logical to suppose that it will receive its share of attention, along with valve setting, ignition, and carburetter, at the hands of the "tuner up."

He has been rather erroneously led to believe that high compression means high power, and probably an increase of revolutions. As a result he will set about getting deeper valve caps or possibly going to the length of having a cut taken off the bottom of the cylinder or the top of the crank chamber, either of which methods serves to increase compression ratio. The "tuner up" may or may not get good results by this means, because unless he keep track of what he is doing he can have no proper idea of whether he is going far enough or has actually overshot the mark. The really successful tuner is he who takes careful note of every adjustment or modification which he thinks fit to introduce into an engine, as by this means he obtains a store of knowledge which he can apply equally well in a great number of different cases. If, however, anything has to be done in the matter of altering the compression of an engine, it is most essential that due note should be taken of this feature before any modifications are made. Unfortunately this desired knowledge of compression ratio is a thing which takes a little trouble to find. By compression ratio is meant the volumetric capacity of the cylinder and cylinder head when the piston is at the bottom of the stroke, divided by the same capacity when the piston is at the top of the stroke.

Calculating from a Sectional Drawing.

Where, as in the case of engines with overhead valves, there is a symmetrical arrangement of the cylinder head a fairly good idea of the compression ratio can be obtained by a simple calculation from a section of the engine, because if the actual head of the cylinder be practically flat the compression ratio will then become the distance between this head and the piston at the bottom of its stroke, divided by the distance between the head and the piston at the top of the stroke. It is only with an engine of this type that a paper calculation is likely to be worth while, but in any case it opens up so many opportunities for small errors to creep in that it will hardly apply to the man who likes to work to a place or two of decimals. The drawing from which one makes calculations may, for instance, be not exactly to scale, and also it may not be a dead accurate representation of the engine undergoing the tuning process, hence from every point of view a direct and absolute determination of the compression ratio is to be preferred.

In the case of the average engine which has side-by-side valves, and so cannot have a symmetrical cylinder head, calculation of the compression ratio is almost out of the question, as it involves a series of very tedious processes in which the factor of error is likely to prove a high one. Calculation is not by any means impossible, but it is certainly not expedient. However careful be a pattern-maker, and however accurate and careful be a foundry-hand, the actual cylinder will differ to a sensible degree from the section shown on the works blue-print, and if it is not going to be machined all over with considerable nicety, unknown quantities are going to be introduced which may upset the truth of the calculation very greatly. On the other hand, if measurements are to be taken from the engine itself they will take as long and give as much trouble as carrying out a mechanical process which will give a perfectly accurate and absolute result.

Compression Ratio.—

There are three principal ways of obtaining the figure of compression ratio. They are, all of them, simple and capable of giving good results if applied intelligently.

The Shot Method.

The first, which is the cleanest and best, is known as the "Shot" method, and the *modus operandi* is as follows:

First, obtain a few pounds of fine lead shot. This may be obtained at an almost negligible price from electricians, who use it for filling the counterpoise of electroliers. Obtain a short piece of ordinary steel cycle tubing about three or four inches long. The gauge is immaterial, but it is important that the ends of this should be cut off as square as possible. Measure the internal diameter and the length of this tube as exactly as possible. For the sake of illustration, we will suppose that it measures $1\frac{1}{8}$in. × 3in. respectively. This piece of tube must now be put on a pair of scales, the more accurate the better, and carefully counterpoised by a certain amount of shot in the weight-pan of the balance. The tube must now itself be filled with shot, which can easily be done if it is stood on end. If the balance be now equalised, the weights which have been added to the pan will give the exact weight of the shot inside the tube. By this means one obtains the exact weight of shot per cubic inch. We will suppose the tubeful of shot weighs $1\frac{1}{4}$ lbs. The cubic capacity of the tube will then be as follows:

$$\text{Length} \times \text{radius squared} \times \frac{22}{7} \quad (\pi = 3.142)$$

That is to say, 2.98 cubic inches of shot weigh $1\frac{1}{4}$ lbs.

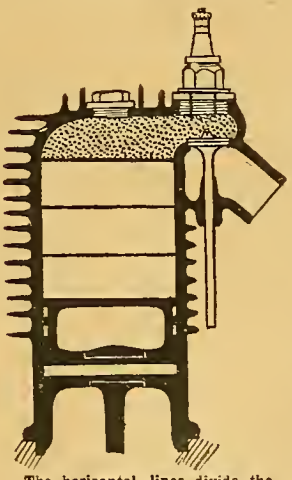
Therefore a cubic inch of shot weighs .419 lb.

Now weigh out five or six pounds of shot and use these for a store from which to draw for the operation about to be described.

By means of a spoke passed through the compression tap, ascertain the point at which the piston is at the extreme top of its stroke, and in order to maintain it in this position drive a wooden wedge between the edge of the belt pulley and the crank chamber. Make sure that the piston is at the top of the *compression* stroke so that both valves are closed.

Remove the compression tap, taking note how far its stem extends down the internal thread cut in the cylinder head. This is easily discernible by the small carbon deposit which is always to be found on that part of the internal thread in the cylinder head which is unused. Leave the sparking plug *in situ* and also the valve caps. By means of a small tun-dish, which may be made out of a sheet of stiff notepaper, fill shot into the cylinder as long as it will take any, and when it is full, stir the shot round as much as possible with a spoke so as to ensure the pellets running into the valve chamber and entirely filling it up.

Rule of Three.



To ensure that they do this a smart tap or two may be given on the outside of the valve chests with a piece of wood, the effect of which is to shake the shot sideways. If there is any doubt about this matter, remove the plug and see whether the shot have gone where they ought to, afterwards replacing it. In filling up the cylinder with shot in this way, care must be taken not to spill any, as the weight of the shot so filled into the cylinder is ascertained by weighing what is left of the store originally weighed out. On re-weighing this store, it is found, let us say, that 2 lbs. 6 ozs. have been filled into the cylinder. From this, by means of a simple proportional sum, is calculated the cubic capacity of the clearance volume above the piston, which from the foregoing data is 5.66 cubic inches. The compression ratio is now given by the following fraction:

$$\frac{\text{Cubic capacity of cylinder in inches} + 5.66}{5.66}$$

The cylinder capacity in cubic inches is easily measured, as there are 16.38 cubic centimetres in a cubic inch, and particulars of the cubic capacity in centimetres is given of nearly all engines, but if not given can easily be calculated from the bore and stroke. Assuming the engine to be one of 500 c.c., then the cubic capacity is equal to 30.5 cubic inches and the fraction is, therefore,

$$\frac{30.5 + 5.66}{5.66} = 6.39.$$

The compression ratio is, therefore, 6.39, from which the compression in pounds to the square inch can be found by multiplying this figure by 14.7.

The horizontal lines divide the cylinder, with piston at bottom of stroke, into four equal volumes. Hence the compression ratio (the space being indicated by dotted shading) is 4 to 1.

When the above operations have been carried out the cylinder is removed and the shot poured away, the only thing in this connection necessary to observe being the placing of a clean rag on the top of the crank chamber to prevent any shot falling inside.

The great advantage of the shot method of ascertaining compression ratio is that, in addition to its exactness (which, of course, depends upon the accuracy of the weighing), it is perfectly clean, and can be carried out successfully with an engine of which the piston is an exceedingly slack one. As a matter of fact, if the piston be tight, fairly thick oil can be used instead of shot, but it is rather a messy business, and owing to the large amount which adheres to the cylinder walls not likely to be very accurate.

Second Shot Method.

The method described above is not applicable to all engines. In the case of the Indian, for instance, it might be rather hard to work, or, in fact, with almost any engine which has a detachable head and valves above one another. In this case, another method, which in some ways simpler, can be used. After having ascertained the weight of a cubic inch of shot, the cylinder head is removed and is filled so that the top of the shot is flush with the washer against which comes the edge of the cylinder liner itself, and from this is calculated the cubic contents

Compression Ratio.—

of the cylinder head alone. Bore and stroke being known, the volume swept out by the piston can also be easily calculated. The only thing left to do is to ascertain by how much the piston at the top of its stroke is separated from the washer or ground joint on the detachable head. If an engine has been run for some little time this distance is always accurately recorded by the carbon deposit, which can be easily measured.

Let us suppose that the cylinder is, as before, of 500 c.c., or 30.5 cubic inches capacity, and that the head by itself has a cubic capacity of 2.8 cubic inches. The depth of the carbon deposit is, let us suppose, 7 mm., whilst the bore of the cylinder is 85 mm. From the last two figures can be calculated the volume enclosed by the clearance between the piston and the cylinder head, which in this particular case is 39.73 cubic centimetres, which is equal to 2.42 cubic inches. The compression is, therefore, represented by the following fraction:

$$\frac{30.5 + 2.8 + 2.42}{2.8 + 2.42} = 6.84 \text{ compression ratio,}$$

that is to say, compression pressure 100.5 lbs. to the square inch.

Needless to say, both the above cases are fictitious, as such high compression ratios are not found on ordinary engines.

Third Method by Means of a Pressure Gauge.

This is the least accurate of the three methods which are given, but has a great advantage, that it does not require the engine to be taken down, although, as a matter of fact, on very few modern machines is this much trouble. The pressure gauge requires to be a sensitive one, designed to read up to 90 lbs. The wider apart are the limits marked on its dial the greater the ease whereby its indications can be read accurately. The gauge must be furnished with an adapter screwed so as to fit the sparking plug thread into which it should be screwed as nearly as possible exactly the same depth as the sparking plug itself. Two difficulties now present themselves. Firstly, that the compression must be read whilst the engine is being turned over fairly briskly, and also that such compression will only be registered momentarily. Both of these difficulties can be overcome by a very simple little device.

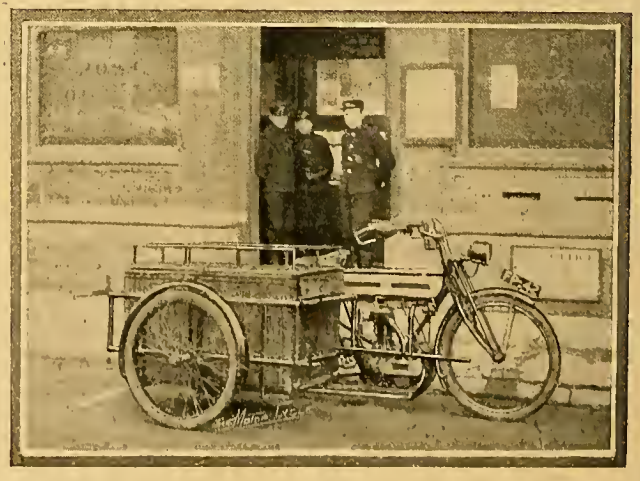
Stick on to the dial a semi-circular strip of paper. This can be done with a few spots of wax without harming the dial at all. This piece of paper must first be thoroughly smoke-blacked by holding it over a little burning turpentine. Next attach to the hand of the pressure gauge by means of sealing wax a short length of very thin wire, the end of which lies immediately under the hand, and presses lightly against the blacked paper. When the gauge is screwed into position on the engine the latter may be pedalled or otherwise turned round any number of revolutions at any rate of speed, the small recording device always showing the highest pressure achieved. The throttle should be left open for this test.

For the sake of example, assume that the pressure thus shown is 71 lbs., then the compression ratio is given by the fraction, $71 \div 14.7 = 4.8$.

In the above descriptions we have not dealt with the value of compression in regard to the efficiency of an engine, but this point we hope to discuss in a subsequent article. W.G.A.

The Motor Cycle in the Mail Service.

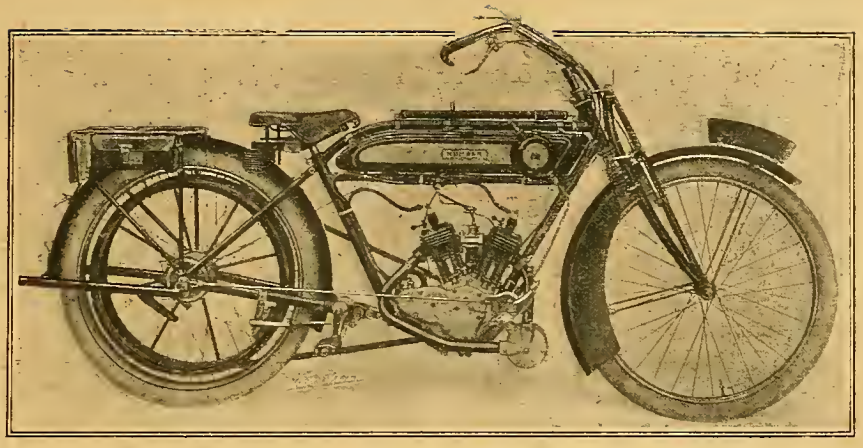
MORE than a year ago, the Postmaster of Oakham, Mr. G. H. Geeson, invited tenders for a motor mail service between Oakham and Wymondham. A local tender proposing to run the service with a 3½ h.p. Triumph motor cycle, in combination with a Mills-Fulford commercial sidecar, secured the contract, and the service was commenced on February 19th, 1911.



The distance between Oakham and Wymondham is eight miles, and this has to be covered twice daily during the week, and once on Sunday, making a mileage of 208 miles per week.

This motor cycle mail service leaves the Post Office, Oakham, every morning at 6.15, and deposits mails at the intermediate villages of Ashwell, Teigh, and Edmondthorpe, reaching Wymondham at 6.55 a.m. At 11.15 a.m. it leaves this town, picking up again on its return journey, and in addition, clearing pillar boxes *en route*. This quick service is again repeated later in the day.

During the whole time the Triumph outfit has been running—its yearly mileage being over 10,000 miles—it has given every satisfaction to the postal authorities. The engine has never failed, no trouble whatever has been experienced with the constructional details, and there has been no difficulty in maintaining an accurate time table.



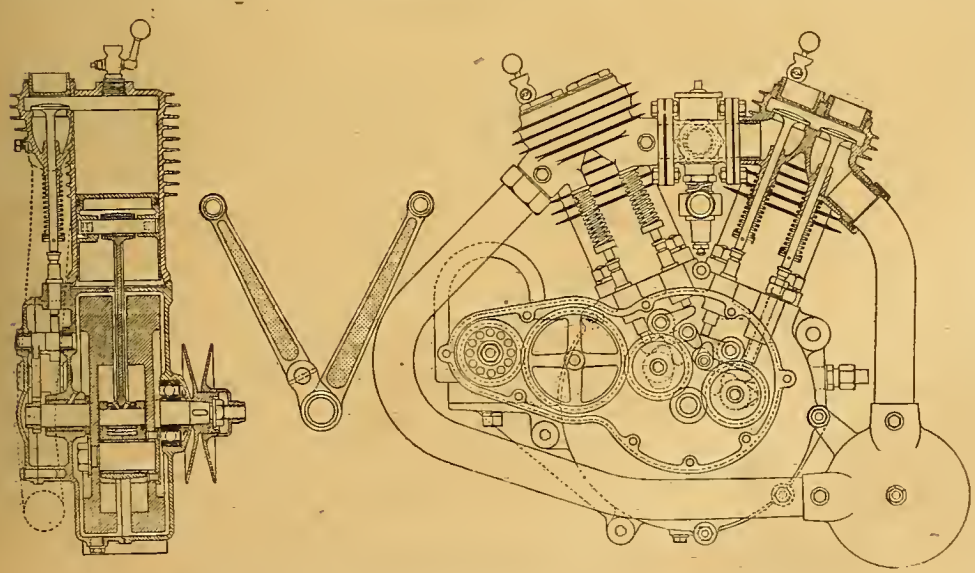
It is rather interesting to note that this motor cycle, prior to being employed in the mail service, was ridden solo for 10,000 miles.

So successful has been this initial experiment that the Postmaster is authorising the use of another of these mails to commence early in April, and it is on the *tapis* that another route will be served by the same means.

A Triumph and sidecar which regularly carries the mails in the neighbourhood of Oakham.

The Small Twin and its Attractions.

2¾ h.p. twin-cylinder Humber, with Armstrong three-speed gear and clutch.



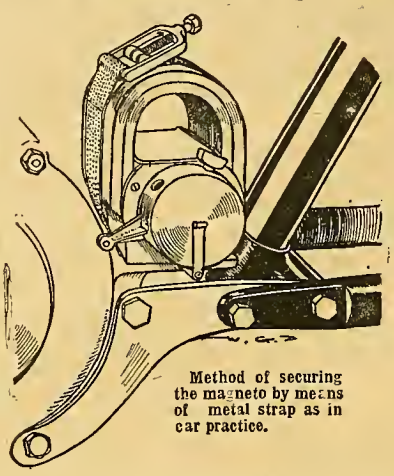
TO those riders of 3½ h.p. single-cylinder mounts who have come to regard their machines as uninteresting, go anywhere motor cycles, shorn of all interest and excitement by reason of their unfailing reliability, and who sigh for something more interesting and more fascinating to ride, we would say try a 2¾ h.p. twin Humber. We have undergone such an experience, and we have been converted. The writer has for years been a staunch supporter of the 3½ h.p. ultra-efficient single-cylinder, but gradually a feeling has crept over him that, after all, the 3½ h.p. single has become an uninteresting machine to ride. Years ago we were not certain of ever reaching home to time, but latterly we have been able to keep our appointments by motor cycle with the certainty of a railway train, and there is little to vary the monotony of the continual "pop, pop, pop" of the engine.

But there are new delights in store for those who would sample a miniature twin such as the Humber. Instead of the plugging of the one lunger, a smooth even purr is all one hears as the machine flies along, bounding over pot holes with a surprising absence of jolting, due to the well-balanced engine and comfortable riding position.

An All-weather Mount.

It is a most handy little machine in every way, and with a three-speed gear, just such a mount as would appeal to the all-weather rider, seeing that it is as stable in grease as a push cycle, and on the low gear will wind its way up the steepest and roughest hill. Starting is simplicity itself. One may either sit on the saddle and, with the low gear engaged and the valve lifter raised, hobble de horse the machine for a couple of yards, when away the engine will go, or alternately walk comfortably alongside, place one foot on the rest, and at the same time drop the valve, and instantly the engine responds. It will thus be gathered that no acrobatic or gymnastic feats are necessary in starting a little Humber, which, in its management, is simplicity itself. By judicious use of the Armstrong three-speed gear rapid acceleration is possible. A fact which will cause no surprise is that the back lash one notices on the top ratio of this gear with a single-cylinder engine is not nearly so pronounced in the case of a twin, owing to the more constant torque.

The speed of this lilliputian twin with its 60 × 60 mm. cylinders is amazing. It is not long ago that motor cyclists of the sporting type regarded 2¾ h.p. lightweights as a sort of potterer's mount, but now the conditions have changed, and instead of the bare 40 m.p.h. which was the order of the day a year or two ago, one can hit up 50 m.p.h. on the road as a usual thing under favourable conditions. This fact no doubt explains why such well-known riders as Harry and Audrey Bashall, Alan Woodman, E. M. Oliver, Sam Wright, and A. G. Fenn have been won over by the little Humber.



End view and side elevation of the 1912 pattern 2¾ h.p. twin-cylinder Humber engine.

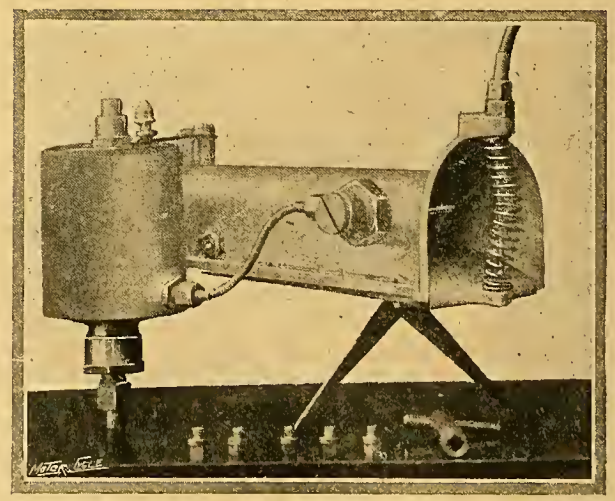
Some Features of Design.

For sheer originality in design there has been no machine evolved to equal the Humber with the possible exception of the two-stroke Scott.

The Small Twin and its Attractions.—

One can picture the confidence of the designer who sets out to produce a V-type twin-cylinder engine with offset cylinders, compound connecting rods, flat-faced valves, single step-cut rings to each piston, and other original features of minor importance. Its object was to win the Junior T.T., and it is now known the world over that it was successful, averaging with P. J. Evans in the saddle, 41½ miles per hour; surely never had a newly designed motor cycle such a splendid send off. Since then, of course, Sam Wright has established a new hour record with 58 miles 1,408 yards, and the feat still causes much wonderment in motor cycle circles.

Method of securing the magneto by means of metal strap as in car practice.



We reproduce a drawing of the Humber twin engine. Each flywheel and spindle are formed of one solid steel stamping. Both cylinders are identical in design, and therefore interchangeable one with the other. The plugs are placed in the cylinder crown, and are fired by an Eisemann magneto secured by a metal strap as in car practice to a bracket formed at the rear of the crank case. All valves are mechanically operated, each cylinder having its own separate cams and valve tappet levers. The exhaust valve lifters are inside the timing cover, and are operated by cams, one valve being arranged to open in advance of the other.

The three-speeder weighs in the neighbourhood of 150 lbs.—which is designated "lightweight"—but the extreme mobility of the machine would not lead one to suppose that it exceeded one hundredweight.

Altogether we are looking forward with great interest to mastering the whims and idiosyncrasies of our little stranger which has won such good opinions during its short sojourn. Only one point has drawn forth criticism—we refer to the somewhat inaccessible position of the carburetter sandwiched in between the cylinders. We have reason to believe that this small point will soon receive attention, as Humber, Ltd., are not the firm to allow such trifles to mar their progress.

A RACING CARBURETTER.

WE reproduce on this page an illustration of the latest Binks carburetter, designed expressly and solely for racing purposes and hill-climbs. This instrument has no throttle, so the machine must be ridden to the venue with an ordinary carburetter. The control is effected entirely by means of the tongue, or shutter, which for starting purposes is brought up to the horizontal jet. This gives a rich mixture. When under weigh the tongue is dropped and the air fully opened, and full speed is attained in a very few yards. All the air rushes past the jet, which has six holes in it, through the venturi tube, and straight through to the engine without meeting any obstruction. In this way it is claimed that full power can be got out of the engine, and we are informed that a speed of 71 m.p.h. has been attained by a T.T. machine fitted with this carburetter on a private stretch of road. The novel design of this carburetter should ensure the engine getting as large a charge as it can possibly take, of course excepting methods of forced induction and the compression of the charge before it enters the cylinder.

New design Binks racing carburetter.

THE USE OF THE CLUTCH.

Now that free engine clutches are becoming almost universal on motor cycles, the following few words of advice on their use should be read and inwardly digested. Clutches are like servants—treat them as you would a good one and they will serve you well. Ill-use them and they will rebel.

Do not make use of the clutch unnecessarily, and do not demonstrate for the benefit of others (unless you are in the business) what it is possible to do with the aid of a clutch in the way of restarting on very steep hills. When starting, make use of the clutch by all means, but do not expect it to perform miracles, *i.e.*, instead of expecting it to do all the work of starting the dead load, slightly pushing off with one foot while letting in the clutch will ensure a longer life for the clutch and enable a much easier start.

The careful expert rider by considerate use of the clutch will probably go through a season's riding without the slightest necessity for clutch adjustment, whereas he who ill-uses the device will merely add items to his repair account.

The largest and strongest clutches used on motor cars have to be handled with consideration, otherwise the leathers or clutch plates will be damaged.

A Cute Sidecar Tip.

Last week a well-known Triumph rider showed me a positively inspired tip for sidecar users. He obtains a couple of spare union nuts, which he screws over the open ends of the socket pins of the cycle clips whenever the sidecar is detached. These nuts keep the threads on the pins clean, and considerably facilitate the attachment of the sidecar when it is required. In the case of clips which have a hollow socket for the end of the sidecar tube to enter, as well as a screw thread, it is advisable to make a cap for the central hole in the union nut, either by slipping a penny under it, or soldering a thin disc of metal over it. The butt of the tube will then find clean entrance.

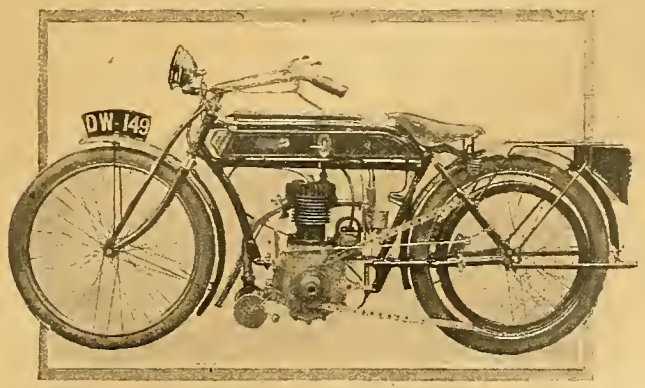
Three or Four Wheels.

"Cyclecar" (forgive the horrid word) users should allow their tyre fads to decide whether they will use a three or four-wheeled pattern. There are some riders (how I envy them!) who by some skilful knack slide the stiffest and newest 3in. cover out of the rim with a couple of prods from a penknife or tooth pick, whose patches never curl and always stick, who spot the tiniest puncture at sight, and mend the biggest gash in three minutes. Men of such genius will obviously choose three wheels. They may only require to take the wheel out once or twice in a season, for only a bad burst at high speed can wreck a tube. (N.B.—My experience of butt-enders on big three-wheelers has been the reverse of gratifying.)

Personally I am not to be trusted with the repair of the rear tyres on these three-wheelers. It takes me a long time to get a 3in. cover clear of the rim; I get very hot and perspiring and muddy in the process. I not infrequently chew my tube up in the sprocket when I turn the wheel round, and my patches have a loathsome habit of curling off as soon as the tyre gets warm again; if they don't I leave my pipe or my eye-glasses or a tyre-lever inside the cover, and generally do everything I ought not to do. If anyone knows how to avoid profanity on such occasions, I should be grateful for the tip.

There are plenty of worse duffers about, and for men of this kidney the four-wheeler, preferably with detachable wheels, is the only safe cure. Tyre troubles are few and far between with a good—ugh!—"cyclecar," provided it be carefully driven and have heavy enough tyres; but the sportsman who presses such a machine with under-tyred wheels to its maximum of 40 or 50 m.p.h. on a hot day in summer will seldom escape three tyre stops per run; and hence the tyre question is vital, where speed is a desideratum.

The Carriage of Spare Belts.



Year by year I wait eagerly for some shrewd maker to solve the problem of carrying spare belts. On a summer tour in easy country, the belt may, of course, be packed flat on the carrier, and the use of a leather case is an aid to beauty as well as keeping the belt clean. But when a rider leaves home for a month's trip, solo or with a sidecar, during which he intends to visit some stiff country, and expects a certain period of rain, the matter is widely different. The sidecar rider has sundry cunning receptacles such as "boots" and pockets at his disposal. The solo rider furls the two spare belts into neat rolls, and attaches them to various bare spots on his machine.

But watch these two gentry after a trying day's work among the hills in wet weather. Both men's hands are filthy, and both machines are bulging with loose belts flapping about in the wind. I always set out with the spare belts curled neatly round the tank, and sometimes protected by a sheet of American cloth wrapped neatly over them.

However, after two hours of rain among the hills there is one belt tied loosely round my waist, another sticking out of my rabbit pocket, and making me look as though I had a tumour on my hip, and a couple more untidily furled round my lamp and handle-bar.

Light for Night Repairs.

A correspondent informs me that the easiest way to get light for repairs and adjustments on the rear part of the machine at night, without unshipping the lamp, is to put the helm hard over, so that the lamp shines at right angles to the machine, and then to fix any light coloured object, such as a handkerchief or sheet of paper, at the side of the lamp as a reflector. He says that a pocket handkerchief or a newspaper is quite efficient when thus employed. I have tried this tip when I merely desired to glance at the machine, *e.g.*, to find where the rear tyre valve was when I wanted to inflate the tyre. But for a prolonged job I must admit that I prefer to unship the lamp and generator and stand them in the road, so as to perform the work in comfort. If I were in the habit of regularly covering long distances at night, I should carry one of the repair lamps sold for the purpose with a long piece of rubber piping to fit to the generator.

A locally assembled 2¾ h.p. Livingstone with Arno engine, by V. J. Ashton and Sons, of Newport, Mon. It has been built to special order with 24in. wheels, enabling a saddle position only 27in. from the ground.

THIS year is to be *the* year of the motor cycle just as next year is going to be *the* year of the aeroplane.

It is extremely difficult to define definitely the present indefinite condition of affairs in the military motor cycle world, but an impartial summary of the position could be put as follows.

On the one hand we have:

(1.) A distinguished company of generals clamouring for the assistance of motor cyclists at Army Manœuvres.

(2.) An enlightened Director of Military Organisation clamouring for motor cyclists in the event of war.

(3.) A parsimonious financial secretary at the War Office trying to conceive a plan for getting sixpen'orth of efficiency out of a halfpenny.

And on the other hand we have:

(1.) Hundreds of patriotic motor cyclists willing to serve their country provided a workable scheme be devised.

(2.) Willing organisations, which are unfortunately somewhat ignorant of military requirements, anxious to help.

Motor Cyclists' Demands.

It might be thought that with all this goodwill matters would progress swimmingly, but alas! a little knowledge is a most dangerous thing, and the mutual knowledge of the military authorities and of the motor cyclists is not by any means great, and the probable result will either be a *fiasco* or a continuation of the shilly-shally policy of the past five years.

Now, as I believe that if all motor cyclists who have military leanings banded together, it would be possible to obtain suitable recognition from the War Office, I ask all motor cyclists to club together to support themselves and one another, and to postulate the following conditions before they offer their services to any military organisation:

(1.) Official recognition.

(2.) A petrol allowance of 6s. 6d. a day when employed.

(3.) Daily pay at the rate of 2s. a day.

(4.) (*a*) Full board and lodging or (*b*) payment of hotel bill, or (*c*) a board and lodging allowance of 6s. 6d. a day.

The Legion of Cyclists.

Within the last few months a powerful association has sprung into being and is forming branches all over the kingdom with the sole object of providing cyclists and motor cyclists for the use of the military authorities in the event of an emergency. So far as motor cyclists are concerned, this emergency occurs annually, at the time of the autumn manœuvres. Already this Legion of Cyclists possesses more than one hundred branches throughout the kingdom, and hundreds of motor cyclists of a military turn of mind are already members. Membership offers the great advantage of not entailing a subscription—all that is necessary is to communicate with the local organising officer or with the honorary secretary at 117, Piccadilly, W., and to enrol oneself as a member.

Moreover, this Legion of Cyclists proposes next month to give a proof of its power, and to call upon all its motor cyclist members to rendezvous somewhere in the Midlands to give a great demonstration of mobility.

A Gigantic Mobilisation Test.

The idea is that on a certain Friday a postcard will be sent to every motor cyclist of the Legion so that it will reach him by the first post on Saturday morning. This postcard will summon him to proceed at once by road to the rendezvous, which will be some convenient Midland town.

Here they will be inspected by various distinguished officers, and a prize will be given to the motor cyclist who is considered to have achieved the best record.

All motor cyclists who are members of the Legion, or are prepared to join it, are eligible to compete under the following conditions:

1. Applicants must enclose one stamped postcard addressed to themselves on the back of which must be written—

Mobilise at the ..... at .....
as early as possible on Saturday, instant.
Hour of departure from home, ...
Witness, ...
Address, ...
.....

The last four lines will be filled in at the time when the competitor leaves home to go to the rendezvous by some independent witness, and the card will be handed to the umpires immediately on arrival at the place of mobilisation.

2. Applicants must enclose three penny postage stamps, and signify their willingness to join the Legion of Cyclists if they have not already been enrolled as members.

3. They must also enclose an envelope addressed to themselves with a halfpenny stamp affixed.

Applicants must also bring with them—(*a*) either an overcoat or a blanket; (*b*) twenty-four hours' food; (*c*) a change of underclothing, just as if they were starting on a campaign.

5. Applications should be addressed to Captain A. H. Trapmann, hon. secretary, the Legion of Cyclists, 117, Piccadilly, W.

It is anticipated that some two thousand motor cyclists will probably compete for this gigantic test of mobility, and arrangements will be made for their accommodation.

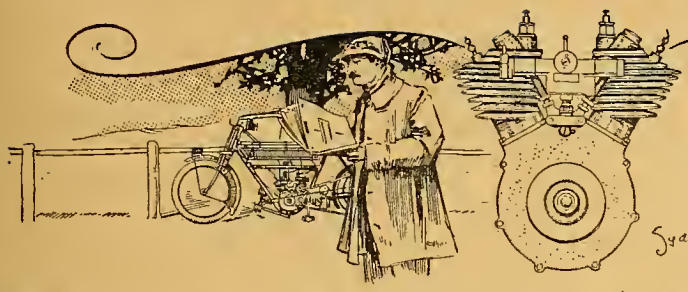
Try the Trident,

The tyre for tourists.

The "Trident" cover was originally designed for the driving wheels of motor cycles of much greater weight and power than the average 3½ h.p. touring machine.

The "Trident," therefore, when used on a 3½ h.p. machine, is not worked up to the limit of its resistance, but has an ample margin of strength and resilience to spare. This ensures freedom from puncture and greater comfort to the rider, as well as longer life to the machine and tyre.

The "Trident" cover, fitted on the rear wheel of a 3½ h.p. machine, in conjunction with one of our "Light" covers on the front wheel, forms the most inexpensive and satisfactory combination of all-rubber covers that you can obtain.



Yet the **PRICE** (26 x 2¼. Beaded Edge) is only **36/=**

WHY AMATEURS GET BEATEN.

By B. H. DAVIES.

ONE or two manufacturers complain that many of their amateur customers are always plaguing them for a few tips which will enable them to win in the best company, and display great annoyance because they find their chances of fastest time in an open hill-climb, when riding their standard touring mounts, are so extremely small. I propose to show why it is difficult for an amateur rider with a fully equipped touring motor cycle to compete successfully against the crack riders of the day, who are usually mounted on special machines.

The Superlative Engine.

The first reason is one of the curiosities of motor engineering. A firm standardise an engine, and put a batch of, say, 500 through their factory. They employ materials of even quality, so far as is possible; every single part is tested by gauges and jigs, and to all human appearance every engine in the 500 is the "dead spit" of all the rest. Yet, despite all precautions, some dozen engines in the batch will be distinctly superior to the other 488; and probably one particular engine will stand out head and shoulders above the pick of the eleven super-excellents.

In the course of use this engine may need renewals, a new cylinder or piston; and such modification will often rob it of that fractional superiority. No matter how carefully it may be repaired, how skilfully it is afterwards re-tuned, it may remain for ever afterwards a perfectly ordinary engine.

Such experiences are commonplaces in the secret history of a factory. Many instances stand out in my memory. I remember how a certain firm used every resource known to chemistry and mechanics in order to duplicate a certain De Dion engine; but their best imitation was 25% inferior to the original. Jake de Rosier's famous "No. 21" Indian twin was made four years ago; and it is alleged, so I am informed, that the Hendee factory has never contrived to produce another quite as fast.

Now these star engines seldom get into the hands of amateurs, unless they are great favourites at the factory. Last summer I was permitted to overhaul the testing slip file at a certain factory, and I found that the testers had earmarked certain machines sent out for tests as possessing star engines; I noted the numbers, and in the course of the season I frequently met these engines at hill-climbs in the hands of famous riders. This is quite pardonable practice—such engines would be wasted on the common or garden duffer.

A firm with a huge output necessarily supplies a few of these star engines to ordinary users, though the cream of them never leave the factory through the ordinary sales channels. A small firm retains them all for its trade riders and the favoured half-dozen amateurs who show up well in climbs—always supposing the small firm's organisation is good enough to identify these engines as they pass through bench or road tests.

The Personal Element.

Secondly, not one amateur in a thousand possesses the knowledge to tune up an engine that the junior tester of a factory staff can rely on. A lad may get a job as a tester when he knows very little indeed. But he spends all the summer riding one make of engine; the more experienced testers give him a few friendly tips, and the flayings he receives from the head of the riding staff if he passes a machine in poor tune soon makes him careful. The head tester, who may be the firm's first string at hills and on the track, no doubt keeps a few tips up his sleeve, but some day the junior is despatched to represent his firm in a climb, and then all the brains of the staff are put into his engine, and he is able to pick their brains to some degree.

The amateur who would cope with this selected and co-operative knowledge must be a man with unlimited leisure, and with quite unusual mechanical gifts. But supposing an odd amateur happens to get hold of a star engine, and has the leisure and the genius to duplicate the last veneer of factory tune, he still needs the riding skill to win; and when you pit a man with whom motoring is only a hobby, who has perhaps a wife and family to think of, and whose racing experience is very limited, against a young mechanic who has everything to gain and little to lose by a win, it is not surprising that the mechanic can display a trifle more dash in the ruts and round a hairpin bend.

The Machine Itself.

Thirdly, it is the greatest possible delusion to imagine that hill-climbs are really won on machines in "strict touring trim," and I say this with all due respect to scrutineers—an office I have often filled myself, and the uselessness of which is tolerably evident; a scrutineer can only limit departures from regular equipment, he cannot exorcise them.

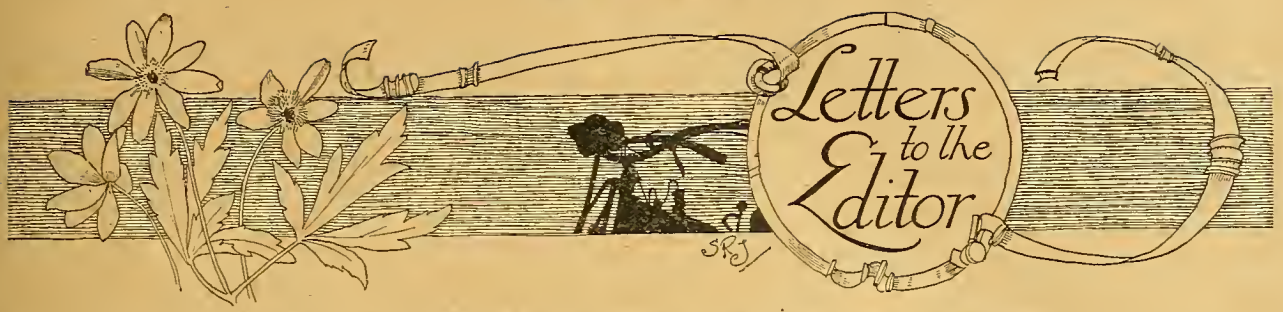
It is true that some firms claim that their hill-climbing and track wins are achieved by the same machines which win gold medals in reliability trials, and there is a residuum of truth in the statements. I once saw three men arrive at the starting point of a six days' trial; during that very afternoon they had pretty well swept the board at a crack hill-climb, and their respective employers were within the frontiers of truth when they afterwards claimed that the hill-climb and thousand miles medals were earned by "the same machines." This expert trio spent half a day at the starting point changing engine pulleys, tyres, wheels, carriers, carburetters, handle-bars, toolbags, and several other minor items.

Why Amateurs Get Beaten.—

Supposing a novice amateur secures a star engine, either by accident or interest, he must first of all learn all there is to be learnt about corner work and holding up the machine on a rutty surface; then he must know all there is to be known about compression and gear ratios, ignition adjustment, valve spring strengths, etc.; then he must get a special pair of light wheels and tyres and strip his machine down to the extreme limits allowable under the regulations; and finally—and this is very often the real crux—he must get the most perfect carburetter adjustment. I have seen many an amateur compete in an open hill-climb on the very same carburetter adjustment he employs in touring work. He seems to ignore the fact that with the abnormal jets and air intakes used in speed work it is a very difficult matter to keep the engine firing in traffic at all. A spectator at one of the French hill-climbs tells me that one of the English experts could not keep his engine firing regularly at a less speed than 30 m.p.h.

Importance of Good Carburation.

It is therefore obvious that the way of the amateur fastest time man, like the way of transgressors, is hard. If he can persuade the ruling genius of a big factory that he is fit to use a star engine, he may secure a good sample, as the factory is sure to turn out more picked engines than its own staff can find work for, and if he gets placed a few times in big climbs with this second grade engine, he may eventually be allotted one of the half dozen super-excellent engines issued each year. But no matter how great his leisure, and how genuine his riding and mechanical gifts, he will find it hard work even to win two or three third places in open climbs, for he is competing against the double-starred engines of a dozen different factories, bestridden by the greatest experts in the trade, and a few amateurs who are at least as keen and able as himself. If any reader has ambitions in this direction I should recommend him to regard the carburetter as the detail which most repays attention.



FURTHER WAR OFFICE TRIALS.

THE War Office is at present taking a great interest in motor bicycles, as was shown by the trial held in the presence of members of the Mechanical Transport Committee, at Brooklands, in the early part of the year. To learn for what purpose the War Office requires motor bicycles may interest our readers. In the first place there is no idea of founding a motor cyclists' corps in the regular army. The real use to which they are to be put is this. The Army Service Corps, as most people are aware, has for its object in life the transport of ammunition, forage, food, and other impedimenta necessary to an army in the field. Nearly all the transportation from the railway to the troops is now effected mechanically, and the vehicles are divided up into companies of fifty motor lorries. These lorries are in charge of a captain who rides in a two-seated car, while the two subalterns are mounted on motor bicycles. One precedes the company and shows the way, while the other follows in the rear to look after any cases of breakdown which may occur. On the occasion of the trial on Tuesday, the 26th ult., Lieut. R. H. Verney, A.S.C., was in charge. Mr. Verney is himself a keen motor cyclist, and rode one of the successful P. and M.'s back to Aldershot when the test was completed. The machines entered were two Phelon and Moores and two Douglases. The two P. and M.'s were fresh from the works, and would have been all the better for a little running in. One of the Douglas machines was withdrawn at the last moment owing to a slipping clutch due to the use of a new clutch lining which was not altogether a success. What the War Office required was the following: That each machine should average 30 m.p.h. for nineteen laps, cover one lap at 40 m.p.h., cover one lap with two up, show a good petrol consumption, and climb the test hill from standing start.

The machines were not timed to the fifth of a second, and were only required to come within a reasonable margin of the set standard. The day was beautifully fine, but a strong wind was blowing down the railway straight. Pratt, who was riding one P. and M., was unable to do the lap at 40 m.p.h., but Marians, who was riding the other, did better than the required maximum speed. Pratt's machine was therefore sent back for further tuning up. On the test hill Marians made an excellent ascent, but Pratt failed the first time, though he was successful on the second attempt. Neither of the two machines had any difficulty in maintaining the thirty miles an hour average, and only one stop was made for a broken lamp bracket, due to setting the lamp too high on the bracket. The machines were fully equipped, and carried two stones of lead. Pratt's machine consumed 3¼ pints of petrol, and Marians's rather under 3 pints. Marians's machine carried a passenger round the track in a satisfactory manner. The Model H Douglas acquitted itself most creditably. It easily averaged over 30 m.p.h. over the 19 laps, made a fast lap at over 42, took a passenger round the track at rather over 39, ascended the test hill satisfactorily, and averaged 130 m.p.g. Other machines such as Zenith and Rudge have gone through these tests in a manner satisfactory to the War Office officials, but this is the first trial to which we have been invited.

Lieut. R. H. Verney, of the Army Service Corps, testing how much petrol the 3½ h.p P. and M. had used after covering about 52 miles on the track.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street E.C., and should be accompanied by the writer's full name and address.

Another Exceptional Hill.

Sir,—The intensely exciting hill-climbs which have recently taken place on Honister go to prove the splendid capacity of modern motor cycles, and the wonderful grit of the men that ride them.

There is a very steep and rough pitch at the head of the Langdale Valley (Dungeon Ghyll), which the coaches in summer *descend only*, after making the long climb from Little Langdale, passing the romantic region of Blea Tarn.

It would be interesting to know if this pass has been climbed by a motor cycle. It is not nearly so long as Honister, but the gradient must nearly approach one in three for the greater portion of the ascent. The road is an extremely narrow one, much cut up and loose, and would prove a good test for man and machine. The distance is about five miles from the famous Red Bank. E. T. COOMBES.

Local Taxation Licence.

Sir,—Are you correct in your conclusion that using the motor cycle, and not merely keeping it, compels the payment of the tax? I have in mind a decision of a few years back, where a heartbroken victim was successfully penalised, despite his assertion that his machine had been for months in an outhouse, unused and unusable and completely dissected, and, further, that he never intended to put it together or use it again. Later decisions, too, I remember somewhat hazily, have declared that "abandonment" must entail official notification to the tax-grabber and the surrender of the number.

This view seems the only sound one from the point of view of the Government, who never pretend to throw in any extras for what they take from you, and my recollection of the Act is that the tax is charged for possessing a motor cycle. Whether or not you can or do use it is a matter of indifference to the Government.

I raise the point, not as a critic, but that we may get it statutorily cleared to prevent misunderstanding and risk. W.J.G.

[See L.C.C. *v.* Fairbank, Justice of the Peace Reports, No. 356, in which this matter is cleared up; also see *The Autocar* of March 16th, page 476.—ED.]

Road Dangers in Devon.

Sir,—I should like to warn your readers against an occurrence which happened to me last winter whilst riding at night between Exeter and Plymouth on a dark night. I had a bad spill when on a lonely piece of road on Dartmoor owing to a loose pony being frightened by my light and suddenly jumping in front of my machine. The pony was standing so that I could not see it, and I never had time ever to lift my exhaust before I crashed into the animal.

I should like to know that if in the event of any serious damage being done I should have been able to obtain redress from anyone. Luckily I was only stunned and bruised, and my machine was not materially damaged. I think the attention of the County Council should be drawn to the matter, as I have since heard that these half-wild Dartmoor ponies are constantly in the habit of straying on the roads, and naturally are a source of danger to motorists. J.P.A.B.

[The laws regarding animals straying on the roads are rather complex, but certainly no redress could be obtained in the case of roads which cross common lands. There have been several cases lately.—ED.]

Hill-climbing.

Sir,—While looking through some old numbers of *The Motor Cycle*, I came across the following in the issue of April 25th, 1904, in which appeared an article by Mr. B. H. Davies, describing a run on a Phœnix Trimo up Westerham Hill. In it he says: "The engine (of the Trimo) is a 3½ h.p. Minerva 82 mm. by 82 mm., being the identical one which was fitted to the bicycle driven up Westerham in the Catford C.C.'s climb at 30 m.p.h. It was then geared 3½ to 1 with a belt drive." Surely this was an extraordinary performance, and if authentic it appears that the present 3½ h.p. is inferior to a smaller engine of eight years ago.

It would be interesting if Mr. Davies could tell us some more about this performance if he can carry his memory back far enough. LIEUTENANT.

This letter was submitted to our contributor, who replies as follows:

"I regret I do not remember the details. I have no doubt that Mr. Hooydonk gave me the gear ratios, and as his victory in the Westerham climb was then fresh in everybody's memory, and the engine was a centre of general interest, any mistake of mine about the gear would probably have been corrected. After all 3½ to 1 is not such a very tremendous gear for an easy hill like Westerham, taken by a light rider with a flying start."

Three and Four-wheeled Cyclecars.

Sir,—I was interested to see Mr. Allday's letter in favour of two driving wheels on a passenger cyclecar. I quite agree with all he says in that respect, but surely he did wrong in calling his letter a comparison between three and four-wheeled cyclecars.

He has absolutely ignored the existence of our old friend the tricycle with single front steering wheel. This was not only the first of the type, but, I believe, has never since been equalled for accessibility. Unfortunately, it went out of fashion before the present reliability was obtained, and very little thought had been spent on silence, transmission, or comfort. Mr. Allday asks for other opinions on this subject, and I therefore have great pleasure in plumping for the tricycle with a single front steering wheel as being the only cross between a bicycle and a car that has not most of the objectionable features of both without the full advantages of either.

The only machine now on the market, to my knowledge, built on these lines is the Roc, which is described and illustrated in the same number in which Mr. Allday's letter appears. Now, apart from the appearance or running of the Roc (I have never been on one), or any other details which might be added or altered in this particular make of machine, I maintain that its specification contains more good points and fewer bad ones than any other cyclecar on the market.

It must be remembered that the single driving wheel type has, after years of work and thought, been brought about as near perfection as the type allows, whereas the Roc, which is the only living representative of its class, is the recent production of the brains of one firm only. I mention this to point out that the possibilities of this type have hardly been exploited at all at present.

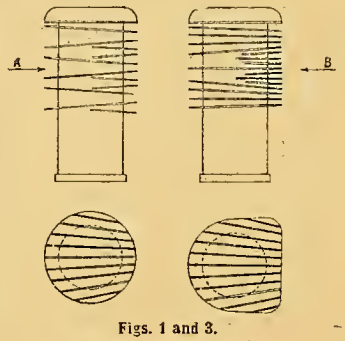
If Mr. Allday's list of points in favour of the fourth wheel be compared with the Roc specification, I think it will be found to vanish into thin air and leave the tricycle with two excellent points to the good, namely, that it has one wheel less and that it has direct steering which is a feature

of tremendous value. Mr. Allday says he wants interchangeable wheels. I don't; I want interchangeable and perfectly accessible tyres, which the tricycle has. The possibilities of seating accommodation, springing, and general accessibility are as good on the tricycle as on the quad.

I should like to add that the general superstition that the tricycle is of necessity a difficult and dangerous vehicle to steer is absolutely false. It is entirely a matter of design and weight distribution.

My pet aversion in the cyclecar line is the four-wheeler with belt drive. Surely if we are going to have four wheels we might try to have a weatherproof transmission.

RALPH WICKSTEED



Inclined Engines.

Sir,—The centre of gravity is not displaced in vertical engines to the same extent as that of inclined engines, therefore a vertical engine ensures more stability in riding and greater efficiency, especially if placed half way on wheelbase line. Moreover, the nearer the rider gets to this point in the adjustment of his saddle, the more ease he obtains on greasy roads. Horizontal cylinder fins are most effective because a greater amount of air passes between them. Air is a bad conductor of heat, and only acts in convection to an appreciable extent. Therefore, the more air that passes between the fins, the greater the cooling effect.

MAC STROKESTOWN.

Sir,—With regard to the question of whether radiator fins on inclined engines should be cast parallel to line of motion of machine or not, I should like to point out one or two aspects of the case which occur to me.

In the first place, with regard to the ordinary vertical pattern engine. It is to be conceived that if the fins were cast as in fig. 1, the cooling effect would be somewhat greater than if the standard design were followed, for it is evident that the cooling air would come into much more intimate contact with that portion of the cylinder which is most naturally sheltered. I think this is a better arrangement than that suggested by "Melanzie" (March 7th), as in his case the sloping fins simply act as baffles to a certain volume of air, thus preventing it from impinging on the fins and consequently losing some possible cooling effect.

Figs. 1 and 3.
A. Direction of motion of air
B. Direction of motion of engine

Considering the inclined type of cylinder with fins at right angles to axis. In this case one cannot imagine the cooling effect to be greater than ($C \sin \theta$), where C is the value of the cooling effect if the fins are parallel to direction of motion. Thus if the engine be inclined at all (either way) the cooling effect is less with fins at right angles to axis, and the less the angle θ the less the cooling effect. Imagine the cooling effect if θ = zero, *i.e.*, cylinder horizontal. The end fin is then simply a baffle.

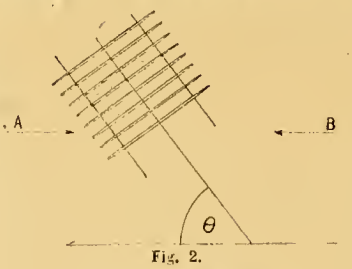


Fig. 2.
A. Direction of motion of air
B. Direction of motion of engine

As to the fact that nearly all firms follow conventional leads in the matter of radiator fins, I suppose one can look at the matter in this way, that, as at present in use, the fins are easily made and in practice give every satisfaction. As regards the inclined engine (and, of course, one naturally thinks of the P. and M.), one would suppose that the makers in the first instance would adopt the present method of placing fins, with the reservation that if it were necessary the alternative method would be adopted. That there has been no need to alter the design everyone knows from the performances that the machines have put up.

Whether some of the firms competing for the hour record will consider it worth their while to improve on the present radiator fin in order to get every ounce out of the engine will be shown in the near future. Personally, I have often thought that a design as fig. 3 would give best results. It will be noticed that in order to get full value from the expanding air the fins are widened as they recede from the first point of contact with the air current.

BETA.

Consumption Comparisons.

Sir,—Your leaderette of March 14th is of particular interest to carburetter enthusiasts, but although bewailing with yourselves the low comparative performance of the motor cycle in petrol consumption, I must disagree with certain statements laid down as facts in your article.

I will quote the particular passages: "In respect to carburation the motor cycle should be more economical, the design of its vaporiser is more settled, and on standard designs the twin lever control of throttle and air is admittedly superior to the single control on a car."

With both of the assertions above I differ, and should like to make a few remarks as to my reason for so differing.

The vaporiser on a motor cycle carburetter consists of a plain jet or jets across which a stream of air blows, petrol issues from this jet or jets in a plain stream at high speeds, and no one can say for certain that perfect or even efficient atomisation is secured by this means. From exhaust gas analysis of some engines fitted with the ordinary type of fine jet carburetter, one is led to the conclusion the petrol *in drops* does go in with the mixture and does not provide an efficient mixture.

Compare this with the best automatic car carburetters and I feel sure that any impartial engineer will agree that the automatic carburetter of the motor car is an infinitely superior vaporiser or atomiser to the motor cycle carburetter.

Twin lever control, so dear to the heart of speed merchants, is, to my mind, a delusion and a snare. What motor cycle manipulator (excuse the term) can or will guarantee that he is running at maximum efficiency at any particular time? I do not believe that any man can adjust such a delicate piece of mechanism as a carburetter in one or two seconds to produce maximum efficiency or even approximately maximum efficiency, and after all this is what twin lever control necessitates—a constant succession of adjustments made in a second or two to meet a condition felt or judged by the lever manipulator.

The expert follows a rule of thumb law or practice learnt in the hard school of experience and "gets there" approximately. The novice is content if the engine pulls sufficiently well to prevent stoppage.

Neither is certain that the mixture is the "best possible" under the given set of conditions, and this is where the single lever automatic carburetter is superior.

It was not until I had the experience of riding on Mr. E. B. Ware's Chater-Lea 8 h.p. twin, fitted with a really automatic one lever carburetter, that I realised the surprising smoothness and flexibility of such carburation, and the feeling of happiness, if I may use the term, is not the least of its advantages.

As a step in the investigation of the problem, to discover whether the loss to the motor cycle is due to engine transmission or wind resistance, I would suggest that motor cycle engine manufacturers give us the results of accurate bench tests in petrol consumption. The average of a well-tuned car engine is about .75 pint per b.h.p. per hour, although figures much better than this can often be secured.

What are the figures for motor cycle engines? It will interest your readers to know that motor lorries weighing about seven to nine tons give over sixty ton-miles to the gallon.

A touring car giving forty ton-miles to the gallon is looked on as particularly good. Smaller cars give up to thirty ton-miles per gallon, and motor cycles average about fifteen ton-miles per gallon.

Perhaps some of your readers can deduce a theory from these figures.

F. N. PICKETT.

Sir,—I notice in your issue of March 25th a statement by Mr. Axford to the effect that he can average 110 m.p.g. with his 6 h.p. Zenith.

I should very much like to know how he can manage this low consumption. Does he run his machine for a mile on a perfectly flat road, with a following wind blowing at the rate of 40 m.p.h., take the consumption of petrol for that mile, and then work out the mileage per gallon? I have ridden three 3½ h.p. machines, and thought myself lucky if I could get 90 m.p.g.

I have just invested in a 6 h.p. Rex sidette, and can get just about 50 m.p.g. with a 9 stone passenger and about 60 m.p.g. when riding solo with sidecar detached. There are a few hills around here (Pembrokeshire). For example, take from Haverfordwest to St. Davids—sixteen miles and sixteen hills, and some of them are stiff ones. I should like to see Mr. Axford average 110 miles on that run.

It is very interesting to see it stated that a 6 h.p. machine can be run 110 miles on a gallon of petrol. I wish I lived near Mr. Axford, I would willingly go for a run of 110 miles with him, and if he did manage the whole distance on one gallon would willingly sell my Rex and straightway buy a Zenith.

ALEX. ROGERS.

Resignation of Mr. F. Straight.

Sir,—I notice in your last issue that Mr. F. Straight has resigned the secretaryship of the A.C.U.

Considering the many years that Mr. Straight has held this office, and the enormously good work he has done for motor cycling, I wish to suggest that you should lend your services to receive from Mr. Straight's numerous friends signatures for facsimile on to a testimonial as a recognition of his services.

What motor cyclists owe to Mr. Straight will never be known, but, speaking for myself, I can say that during the six years I have competed in A.C.U. events I have always had the greatest consideration and courtesy shown to me by him, and often under circumstances trying enough to test a saint.

I trust others will come forward with the same object in view. FRED DOVER.

[We have received a similar letter from Mr. C. C. Cooke, hon. secretary of the Herts County A.C. (Motor Cycle Section).—ED.]

Climbing Honister Pass.

Sir,—With reference to a letter from Mr. J. A. Roche regarding Mr. Frank Smith's remarkable climb of Honister Pass, I think it only fair to point out that the road was not cleared of loose stones previous to Mr. Smith's attempt; all that was done to the road was to brush the loose shingle to one side for about two yards at one place only, where it was impossible to get a grip with a motor cycle wheel. I am fully convinced if this had not been done no motor cycle or sidecar combination would have got up, as it was like a river bed at this point; in fact, all the road is, due to the heavy rains, which rush down the mountain side and run across the roads.

I should further like to point out that at this particular spot it was not safe to try to get over it, as Mr. Roche would no doubt have agreed if he had witnessed Mr. Smith's first attempt. The loose shingle caused the combination to skid bodily to the edge of the road, and anyone who knows the Pass will agree that if you go over the edge at Hillstep you will not require a motor cycle again.

I should also like to inform Mr. Roche that Mr. C. R. Collier had one if not more attempts on the Friday before the witnessed ascent on March 16th. Both Mr. Smith's and Mr. Collier's ascents are worthy of a great deal of praise, but as one machine was higher powered and the other lower geared it hardly does to class them together.

I should like to ask Mr. Roche if he has ever seen the Pass, as I am sure he will agree with me, if he has, that Mr. Frank Smith's ascent on a 5-6 h.p. with passenger was a most remarkable feat considering the road surface and a two-mile run on a low gear before the worst part could be tackled. I think myself that the Clyno Co. have something to be proud of to be the very first firm to produce a motor cycle with sidecar that will take driver and passenger up the well-known and always considered impassable climb of Honister Pass.

F. GREENWOOD.

The A.C.U. Formula and Two-stroke Engines.

Sir,—Replying to "A Believer of Four-stroke Efficiency" in your last week's issue, if the author of the letter who claims that the P. and M. would have beaten the Scott, even if the latter had been reckoned as a four-stroke, had taken the trouble to verify his statement before committing himself on paper, he would have found that 127 (figure of merit of Scott according to *The Motor Cycle*) divided by 1.32 (A.C.U. special handicap on two-stroke water-cooled engines) gives a figure of merit of 96.2, therefore the Scott and sidecar would have beaten the P. and M. and sidecar (figure of merit 96.5). According to the *R.A.C. Journal*, the figure of merit is given as 126 which makes the position of the Scott still better.

It is surely obvious that the only factors which enter into the handicapping of a machine for a hill-climb are the total weight of machine and capacity of engine.

With regard to the question of relative petrol consumption of the two types of machine, it is common knowledge that larger jets are fitted when competing in hill-climbs (apart from the question of special high compression engines, etc.), therefore, according to your anonymous correspondent, a petrol consumption trial up the hill would have to be made before every hill-climb, and a special formula devised and worked out for each competing machine.

THE SCOTT ENGINEERING CO., LTD.,
FRANK PHILIPP, Secretary.

Two-stroke Engines.

Sir,—With reference to your leaderette in the last issue, I should like to point out that the power of an engine is proportional to the actual volume drawn into the cylinders, and it is further shown that in a two-stroke engine the pumping capacity of the crank case is very much less than the pumping capacity of the cylinder in the Otto engine, and that consequently a far less charge can be drawn into a two-stroke type of engine. This applies at all speeds—that is to say, if you imagine an Otto engine and a two-stroke engine both turning round at ten revolutions per minute or a still slower speed, it would be quite impossible for the two-stroke engine to draw in more than the actual effective pumping capacity. On the other hand, the throttling effect at high speeds affects the two-stroke very much more acutely than the Otto, because, to begin with, the two-stroke has only half the period during which the charge is admitted. This is borne out by practical experience, as shown by the fact that the Scott two-stroke undoubtedly gives greater power than, say, a 500 c.c. single-cylinder four-stroke when pulling hard uphill at a comparatively slow speed. What the public wants is a machine which pulls well at slow speed, and it is no disadvantage if the engine does not give, compared with the Otto, the same proportionate increase of power at high speeds.

The mean effective pressure of the two-stroke falls off at high speeds in a marked degree, whilst, comparatively speaking, the mean effective pressure of the Otto remains more or less constant. This leads us to the conclusion that the two-stroke engine could only meet the Otto engine on the A.C.U. formula if the speed of the engine were limited to, say, 1,000 revolutions. At twice that speed, say, 2,000 revolutions, the Otto engine should give an allowance to the Scott engine, since in every modern hill-climb the speeds of the engine are certainly over 2,000 revolutions, and it is impossible to expect the Scott to have a chance of winning on the A.C.U. formula.

With reference to the additional water-cooled handicap, the A.C.U. must be aware, from the fact that we can run our machines in competitions without the water-cooling apparatus better than with it, that it is absolutely absurd to inflict a special handicap for an advantage which has not time to materialise in the rush of a modern hill-climb.

THE SCOTT ENGINEERING CO., LTD.,
ALFRED A. SCOTT, Managing Director.

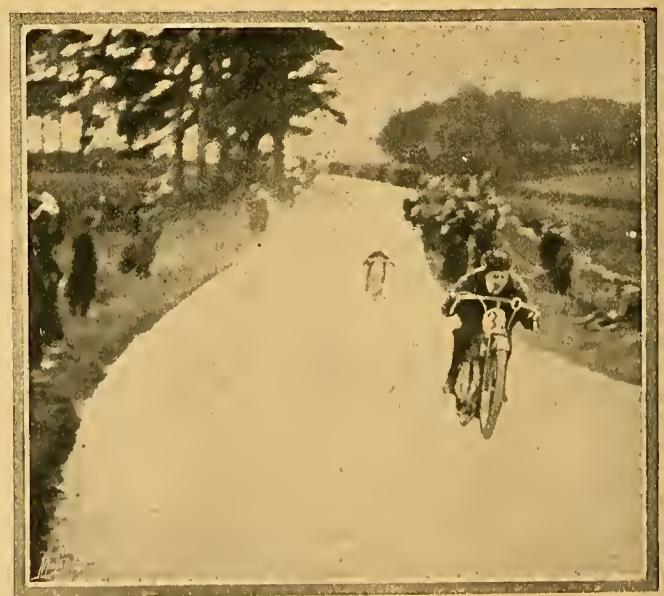
SUMMARY OF CORRESPONDENCE.

A number of correspondents have written to point out that the Differo gear is similar to gears on which they already hold patents or have provisionally protected.

A. H. Priestley, who is the owner of a 1912 model 6 h.p. Rex de Luxe motor cycle with Wolbrown sidecar, writes that he has covered 1,400 miles at an average cost of less than three-halfpence per mile.

RACING IN PAIRS AT OAKAMOOR.

A Record Entry. Some Close Finishes.



Scene at the starting banner. Hugh Gibson (Bradbury) and H. Reed (Dot-Precision).

THE Derby and District Motor Cycle Club embarked on a new venture in organising an open hill-climb for motor cycles, which was duly held on Saturday last, and as events proved the club captured a record entry, for the list totalled nearly 150 in the five classes. Unfortunately, it cannot be said that the organisation was of the best, for at times everything seemed in a state of chaos and the officials by no means had a clear understanding. However, we fully realise the difficulties of handling so large a number of competitors. The way spectators and stray dogs wandered aimlessly about over the course made one's heart quake, but fortunately no one was hurt. The sport provided was good. From a spectacular point of view, of course, nothing can compare with neck and neck racing, and all clubs would adopt the plan were suitable hills to be found in every neighbourhood. Star Bank, Oakamoor, North Staffs., the scene of Saturday's climb, is not nearly steep enough for a hill-climbing test, but the surface is magnificent, and the three bends only gradual ones. The sight of pairs of riders rushing along at over 50 m.p.h. practically side by side was much enjoyed by the hundreds of spectators who lined the roadsides, and several of the duels were worth going a long way to see.

The Afternoon's Programme.

There were five classes on the programme—(1) for Junior T.T. machines, (2) Senior T.T. machines, (3) makers' 3½ h.p. class, (4) twin-cylinder machines, and (5) all comers. The start was on a rise of about 1 in 20, but as a pusher-off was allowed, few had difficulty in getting under weigh, though it was noticeable how some of the variably geared machines scored in this respect. The course measured 1,400 yards, and the average gradient does not exceed 1 in 12. There were fifteen Junior T.T. machines entered in Class 1., the result being an overwhelming success for the 2¾ h.p. overhead valve J.A.P. engine, which was used by all the semi-finalists. David Bolton impressed the spectators most on his Martin-Jap, but, unluckily, when leading in the semi-final his engine seized. Notwithstanding their small dimensions, by general consent the Junior T.T. machines were easily the noisiest of the whole lot entered. Results:

H. G. Dixon (New Hudson), obtains a good lead in the second round of Class 2.

H. C. Newman (3½ h.p. Ivy) gains a good lead in the first hundred yards over W. F. Newsome (Triumph). This was the semi-final, and Newsome was never able to make up the ground he had lost. Many heats are won in the first hundred yards in this way.

SEMI-FINAL.—P. W. Owen (Zenith) beat David Bolton (Martin); H. Berwick (New Hudson) beat H. G. Dixon (New Hudson).

FINAL.—H. Berwick (2¾ h.p. New Hudson) beat P. W. Owen (2¾ h.p. Zenith-Jap) by 100 yards.

Makers' 3½ h.p. Class.

The "makers'" 3½ h.p. class comprised a medley of machines, as rider and machine had to weigh together 350 lbs. Some interpreted the title to mean standard machines, consequently there was the interesting sight of free engine and three-speed touring mounts competing against T.T. racers. The majority used the same T.T. mounts they had entered for the T.T. class. Some fine riding was witnessed. By far the best heat was when Dixon (New Hudson) and Greaves (Triumph) bounded up the rise at over fifty miles an hour, never a machine's length separating them, as each in turn favoured by a bend in the road would forge ahead. Harry Reed (Dot-Precision) was going great guns, and always had plenty in hand of his opponents, despite his thirteen stones weight. W. F. Newsome (Triumph) won several heats in fine style, once after being considerably behind overtaking his opponent near the finishing banner with ease. When his turn came to contest the semi-final with H. C. Newman (Ivy-Precision), it was regarded as a veritable battle of the giants. In the end it was Wenlock Edge over again, for Newman won by about twenty yards. F. C. North (Ariel) had a most unusual experience. He had won his heat on the T.T. Ariel which he has used in all the important trials of late, its mileage totalling about 12,000, when, half way up the hill, the cylinder burst, and little bits of radiator fins and piston were shed all over the road as the machine travelled fully a hundred yards by its own impetus. Though the connecting rod was wrenched in half, the back wheel did not skid, and North safely came to a standstill.

David C. Bolton (3½ h.p. Rudge) finishing an easy winner of the Tourist Trophy class. His riding was much admired.

Racing in Pairs at Oakamoor.—

The minimum weight clause gave considerable trouble. Lead weights were attached to any convenient part of the machine, but the unthinking riders found that the steering was affected at high speed. C. A. Goold (Corah), who fell at a corner, ascribed it to the lead weights attached to the front forks.

J. H. Slaughter (L.M.C.) proved his sporting propensities when he returned for a fresh start with J. Bushby (Rudge), who had chartered three vigorous pushers-off; the last-mentioned did their work so well at the word to go that they pushed Bushby's machine clean out of his hands into the roadside. After that the officials at the start wisely refused to allow more than one pusher-off. One of the favourites, R. Holloway (Premier) travelled exceedingly well, but was beaten by the ultimate winner in a fine race. In the final of this event two users of Precision engines were pitted together—H. Reed and H. C. Newman. The youngster made a splendid start and early established a lead over Reed, whose avoirdupois was against him, but once really going he set himself seriously to overhaul his opponent, and so successful was he in his endeavours that even the spectators at the finish were not sure who had won. Mr. F. A. Bolton, one of the judges stationed under the finishing banner, declared Newman the winner by half a wheel. Strangely enough, the latter's engine seized momentarily immediately after crossing the tape. Results:

H. C. Newman (Ivy-Precision) beat E. S. Brittain (Triumph); W. F. Newsome (Triumph) beat G. Lee-Evans (Ivy-Precision).

FINAL.—H. C. Newman beat W. F. Newsome, and later H. Reed (bye) by half a wheel.

Class II. for Senior T.T. machines provided some spectacular climbs, D. C. Bolton making an extremely fine performance on his Rudge. He rode beautifully, missing the grass at the curves by a few inches only, never swerving, and so earned a well-deserved and popular win. All the semi-finalists put up fine performances. Results:

D. C. Bolton (Rudge) beat W. F. Newsome (Triumph); J. Woodhouse (Regal-Precision) beat H. G. Dixon (New Hudson).

WINNER OF FINAL HEAT.—D. C. Bolton.

Class IV., for twins, was won by George Brough with a fine climb. Miss Muriel Hind put up a good performance on her Rex, but was defeated by Baxter on a similar machine. Results:

E. F. Baxter (6 h.p. Rex) beat Miss M. Hind (6 h.p. Rex); G. Brough (8 h.p. Brough) beat V. Busby (2¾ h.p. Humber).

FINAL.—G. Brough (8 h.p. Brough) beat E. F. Baxter (6 h.p. Rex), and later H. Riddell (Blumfield), bye.

Class V. was an all-comers' event, and here D. C. Bolton again distinguished himself. Brough and Riddell tied for fastest time of the day (60⅘s.), but in the run off Brough was successful. Result:

G. Brough (6 Brough)	60⅘s.
H. Riddell (6 Blumfield)	60⅘s.
D. C. Bolton (3½ Rudge)	61⅖s.
E. Baxter (6 Rex)	63⅕s.
H. Gibson (3½ Bradbury)	68⅖s.
F. Brown (6 Rex)	70⅕s.
F. Holford (3½ Rover)	72s.
Miss M. Hind (6 Rex)	73⅕s.
F. C. Coops (3½ Triumph)	75⅖s.
K. H. Clarke (3½ Corah-Jap)	75⅖s.
J. Woodhouse (3½ Regal Precision)	76⅖s.
E. Brittain (3½ Triumph)	77⅕s.
L. Norton (3½ Bradbury)	77⅖s.
A. Ainsworth (3½ Rudge)	78⅕s.
E. T. Bolton (3½ Rudge)	81s.
G. Castagnoli (3½ L.M.C.)	82⅕s.
L. Mogridge (3½ Mead Precision)	82⅖s.
G. Hill (3½ Rudge)	84⅖s.

The start of a heat. This picture shows the way in which spectators crowded on to the course.

TOW TOP CLIMBED BY SIDECAR.

Continuing his search for unclimbable hills, Frank Smith, last week-end, made an onslaught on Tow Top Hill, near Kendal. He took with him as passenger E. C. Paskell, of Birmingham, who describes Tow Top as a long climb of loose surface, with eight Farlow bends. The Clyno, which was the four-speed machine geared from 3½ to 1 on top to 14½ to 1 on bottom, was successful at the first attempt, though at one point the fate of the attempt hung in the balance. Descending the hill he got up again with a 14 stones passenger. Thus, Frank Smith and his Clyno are again first to climb stil' another notorious gradient.

TWO THOUSAND MILES IN SIX DAYS ON IRISH ROADS.

J. Healy, of the Dublin and District M.C.C., has put his year old six days' ride quite in the shade by riding from Dublin to Cork and back every day for six consecutive days, bringing the performance to a successful termination on Saturday last. Cork is distant from Dublin just under 160 miles, and as Healy added to the mileage by starting each morning from his home at Chapelizod, his mileage for the week totals approximately 2,000 miles. By starting at 5 a.m. and timing himself to do 320 miles in sixteen hours, he only exceeded the legal limit by a narrow margin. The road between Dublin and Cork is probably as good a straight-away stretch of 160 miles as could be found in Ireland. For the greater part it is level, but the hills at Kilworth Camp, near Fermoy, and at Watergrasshill, at the southern end of the journey, gave him opportunities to use the multi-speed gear with which his 3½ h.p. Rudge was fitted. There were only two days on which it did not rain, and on the first day it rained for ten hours. His machine was naturally covered with mud from top to bottom at the end of the ride, but a cursory examination did not show that it was any the worse, and the seal placed on it before the start by the Dublin and District Club, who undertook the checking of the ride, showed that the cylinder had not been disturbed. Healy is a barrister, and a son of Mr. T. M. Healy, K.C., M.P.

B.M.C.R.C. FIRST MONTHLY MEETING.

Success of the Postponed Event. The First Cyclecar Race Creates Much Interest.

Settling down after the start of the 100 miles all-comers' race. The stragglers have lost ground due to sluggish starting.

BRIGHT sunshine and a strong wind which raised the proverbial dust worth a King's ransom were the order of the day on Wednesday of last week, when the postponed B.M.C.R.C. meeting was held. Though held on a Wednesday, the meeting was well attended, which seems to indicate that the abolition of the mid-week meetings is a pity.

The first event was the three-lap sidecar scratch race for machines up to 1,000 c.c. fitted with a touring sidecar carrying a passenger not weighing less than eight stones. Awards: Gold, silver, and bronze medals. At the completion of the first lap, F. W. Barnes led with ease, and next in order came C. R. Collier, B. A. Hill, S. T. Tessier, and J. T. Bashall. In the next lap the order was maintained, but Hill had gained slightly on Barnes, while the final order was as follows:

		mm.	c.c.	m.	s
1.	F. W. Barnes (2-cyl. Zenith-Jap)	90 ×77.5	998	8	44⅘
2.	C. R. Collier (2-cyl. Matchless-Jap)	85.5×85	964	9	2⅘
3.	S. T. Tessier (2-cyl. Bat-Jap) ...	85.5×64	734	9	50⅘

Hill (7 h.p. Indian) retired with a broken chain, and Bashall (8 h.p. Bat-Jap) with a broken valve, both in the third lap.

There were originally ten entries for this event, but Smith (Rudge), Rhys (Zenith), Carter, H. A. Collier, and G. F. Hunter (Matchless) did not start.

100 Miles All-comers' Race.

The next event was the 100 miles all-comers' race for motor bicycles or motor cycles fitted with sidecars up to 1,000 c.c., competitors to be timed for 50 miles, one hour, and 100 miles. Awards: Gold medal to the first motor cycle and the first sidecar machine in Classes A, B, C, D, and E; the club's silver and bronze medals to the second and third respectively. Instead of the gold medal, a silver cup value £5 or cash at option was offered to the rider of the machine making the best performance in each class, provided the 100 miles record is broken. The finish of the 100 miles was 975 yards before reaching the fork in the thirty-seventh lap. Classes C, D, and E with sidecar, and A, B, and C solo, were started first, while Classes C, D, and E for solo machines were started one hour later.

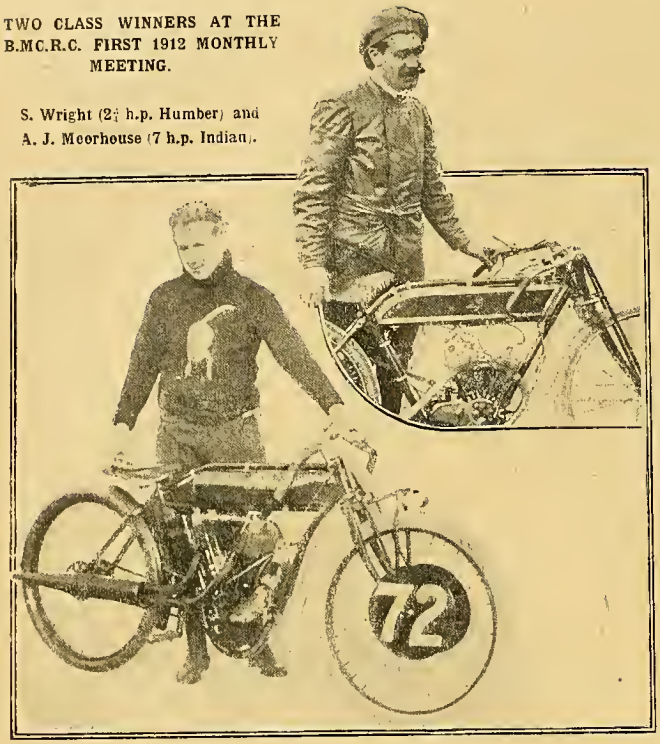
As a spectacle, the race was somewhat tedious to watch. It was just a procession of machines of all classes, and their order, if taken, meant little or nothing. As a test, it was, of course, extremely valuable, and many and various were the troubles experienced. At the end of the first lap, the procession passed in the following order: Barnes and Axford (Zenith), Wright (Humber), Tessier (Bat sc.), H. A. Collier (Matchless sc.), W. H. Bashall (Humber), A. Bashall (Humber), Griffith (Rudge), Woodman (Humber), J. T. Bashall (Bat sc.), W. Smith (Rudge), and Slatter (Alcyon).

Barnes kept his lead throughout, while all the Humbers in Class B ran wonderfully well. Not the least remarkable of the performances of these was Woodman's. Not only did he, handicapped as he is by the loss of one leg, ride magnificently, but he acquitted himself well at the finish of a really plucky ride.

A Thrilling Moment.

One thrilling moment occurred when a competitor cut closely in while passing Woodman, and caused him to swerve. The latter, however, quickly recovered himself in a very clever manner. Tessier was early in difficulties and valve trouble put him out of the running. Axford ran out of both petrol and lubricating oil. Slatter ran well for thirty-one laps, and then with a heartrending screech his engine gave up the ghost, probably a broken connecting rod causing the failure.

The position of the passengers in the sidecar machines was interesting to observe. Some lay back in the seats, others reclined on their sides. Bashall's passenger sat on the footboard; Weatherilt often leant behind the back of the burly Barnes, whose Zenith carried him to victory. H. A. Collier had a spare petrol tin, to which a tyre pump and a delivery pipe were fitted, and at times the passenger was kept busy pumping petrol into the main tank. Griffith, despite much belt trouble, succeeded in finishing.



S. D. Timpson and W. H. Elce (3½ h.p. Rudges) at full speed in the 100 miles all-comers' race.

B.M.C.R.C. First Monthly Meeting.—

TWO CLASS WINNERS AT THE B.M.C.R.C. FIRST 1912 MONTHLY MEETING.

S. Wright (2¾ h.p. Humber) and A. J. Moorhouse (7 h.p. Indian).

Starting the Solo Machines.

Then Classes C, D, and E, for solo machines, were started. Mr. A. G. Reynolds marshalled them in single file, lined them in close order opposite the timekeeper's box, and when the right moment came started them. Then the track resounded with the noise of numerous competitors in full flight. Moorhouse led the ball, but his 7 h.p. Indian was not too noisy. Godfrey, on the other hand, who rode a single-cylinder machine of the same make, had covered auxiliary exhaust ports, and the sound from these was quite noticeable. Moorhouse put up a splendid performance, and spent his time in lapping everybody else. Godfrey made an excellent start, and held the second place till the seventeenth lap, when a broken exhaust valve caused his retirement. Barnes, after running faultlessly for many laps, had the misfortune to have his belt come off, and as it did so it struck his passenger, the faithful Weatherilt, in the eye, stunning him for the moment. Major Lloyd quickly sent a car to the assistance of the wounded one, but by the time it had reached the spot Barnes was again under way.

Results of the 100 Miles Race.

CLASS A.

Slatter retired for reasons stated.

CLASS B.

		mm.	c.c.	h.	m.	s.
1.	S. Wright (2-cyl. Humber) ...	60×60	340	2	10	56
2.	A. E. Woodman (2-cyl. Humber)	60×60	340	2	14	28⅘
3.	A. Bashall (2-cyl. Humber) ...	60×60	340	2	21	46⅕

Woodman's ride is all the more creditable in that he had to stop four times for a loose plug terminal. J. T. Bashall rode well throughout the trial, but was troubled with a leaky tank, while Audrey Bashall (2¾ h.p. Humber) had a puncture. There were six entries in this class—five Humbers and a Martin-Jap; the latter was a non-starter.

CLASS C.

		mm.	c.c.	h.	m.	s.
1.	E. B. Ware (Rudge)	85×88	499	1	47	42⅘
2.	W. D. South (Rudge)	85×88	499	1	50	18
3.	W. F. Guiver (Rudge)	85×88	499	1	51	46⅕

In this class Ayres (Singer) had trouble with his tyre valve pulling out; S. C. W. Smith (Singer) suffered belt trouble; Rhys, who was to have ridden a Triumph, broke the cylinder flange the night before the race, and rode Miller's Matchless, on which he had belt trouble; Elce (Rudge) was put out of the running through a fault in the timing; Spencer (Rudge) had tyre trouble; while Ware (Rudge) had the top of his oil pump come unscrewed on several occasions.

The original entry list for the 23rd ult. (Saturday) contained twenty-three names. Among those who did not compete on Wednesday were Brewster (Norton), Stanley (Singer), Haswell (Triumph), Vernon Taylor (Rudge), C. T. Newsome (Rover), Howard Smith (Triumph), Milledge (Rover), Oldman (Bat), Maurice (Premier), etc.

CLASS D.

Printz and Hal Hill, the only entrants, both on Bat machines, did not finish, the former through belt trouble, the latter through the belt coming off seven times and a puncture.

CLASS E.—Solo.

	mm.	c.c.	h.	m.	s.
A. Moorhouse (2-cyl. Indian) ...	82.5×93	994	1	30	7

This constitutes a record. Previous best, Stanhope Spencer (Rudge), October 3rd, 1911, 1h. 34m. 8s.

Sidecar Performances.

CLASS C.—With Sidecar.

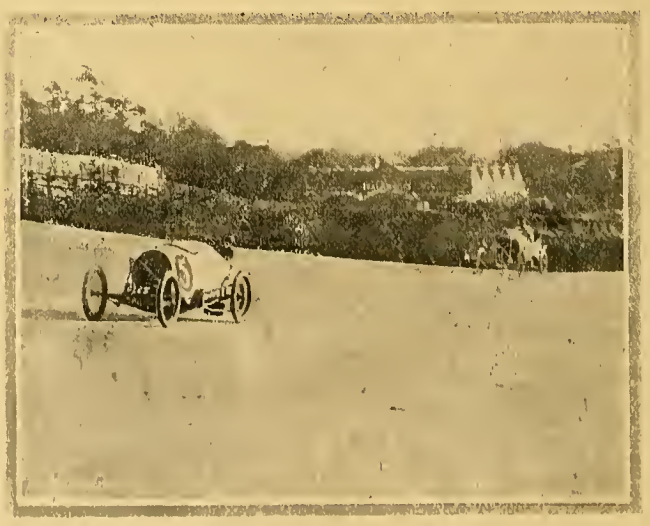
	mm.	c.c.	h.	m.	s.
G. Griffiths (1-cyl. Rudge)	85×88	499	3	6	41

CLASS E.—With Sidecar

	mm.	c.c.
F. W. Barnes (2-cyl. Zenith-Jap)	90×77.5	998

Records—

50 miles ... 1h. 0m. 18⅘s.	2 hours...96 mls. 1,594 yds.
1 hour ....49 mls. 1283 yds	100 miles ..... 2h. 3m. 42⅗s.



The previous best performance for the one hour was by W. H. Bashall (2-cyl. Bat-Jap), 85.5×85 mm., 964 c.c., November 21st, 1911, 45 miles 639 yards; and for the hundred miles, H. A. Collier (2-cyl. Matchless-Jap), 85.5×85 mm., 964 c.c., 2h. 16m. 3s.

The First Cyclecar Race.

The last event—the New Comers' Race—created great interest as it was the first of its kind. It was down on the programme as being for cyclecars of any type or power, but not exceeding 5 cwts. unladen, or 600 lbs. without driver or passenger ready for use. Distance, three laps (about eight miles). Awards—gold, silver, and bronze medals to first, second, and third respectively.

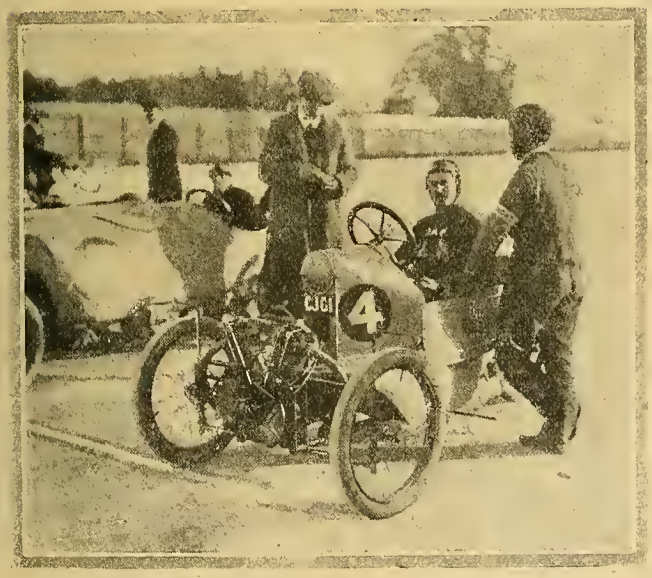
A brief review of the competing vehicles may be interesting. The Autotrix was a sensible looking vehicle, with chain drive, Chater-Lea three-speed gear box, and rod steering. The Morgan had a boat body and a 90 × 77.5 J.A.P. engine with

IN FULL FLIGHT.

An impression of the cyclecars at full speed.

B.M.C.R.C. First Monthly Meeting.—

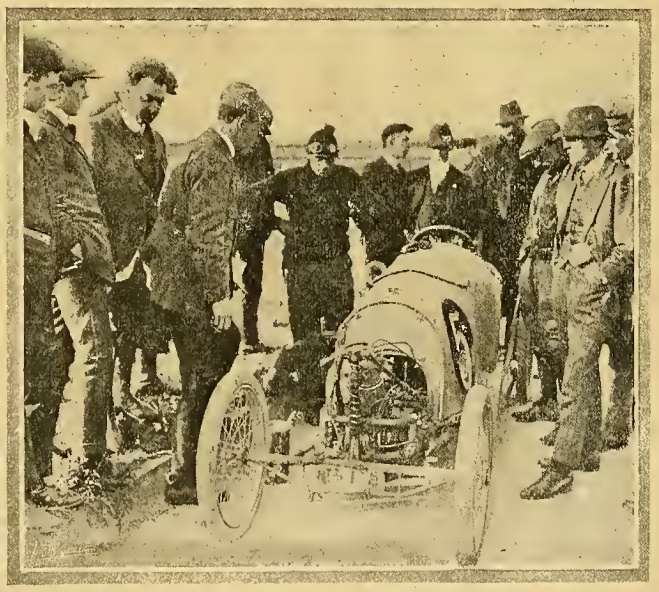
Start of the cyclecar race. It will be noticed that the cyclecar drivers have aped the big car racers even to the smoke of the exhaust!



overhead valves, and was one of the smartest of its type we have yet seen. Godfrey was at the wheel of a Rollo fitted with J.A.P. engine and expanding gear. Both the Bedelias had boat-shaped bodies, and one a 90° Bourbeau engine. E. D. Tate's Sabella-Jap had a 9 h.p. a.o.i.v. engine, disc wheels, and was of distinctly racy appearance.

At the start, Martin in the Morgan was first away. The Bedelia entered by Bourbeau and that driven by W. Ward were pushed off, while the former made a rather poor start.

A Cyclecar Turns Turtle.



At the end of the first lap Martin was a quarter of a mile ahead. The others passed in the following order: Tate, Godfrey (whose machine was misfiring) Robinson, Bourbeau (whose machine followed a most erratic course), Wadden, and Ward. The next lap Martin led by about a mile, and was timed to be doing roughly 59 m.p.h. Bourbeau's machine wobbled till it upset. Godfrey and Robinson brought up the rear. Result:

	mm.			c.c.	m.	s.
1. H. Martin (2-cyl. Morgan-Martin)	90	×	77.5	998	8	32
2. E. D. Tate (2-cyl. Sabella-Jap) ...	85	×	95	1066	11	4
3. J. Robinson (2-cyl. Sabella) ...					13	21
4. W. Ward (2-cyl. Bedelia)... ...	80	×	100	1006		
5. O. C. Godfrey (2-cyl. Rollo-Jap)	85.5	×	85	964		

Harry Martin, winner of the cyclecar race, on his Morgan runabout. As may be seen, the J.A.P. engine is of the overhead type.

Major F. Lindsay Lloyd officiated as judge and clerk of the course, while the timekeepers were Messrs. A. V. Ebblewhite, A. G. Reynolds, P. Dutton, and F. T. Bidlake. Mr. Loughborough's new clock, worked alternately by Major Lloyd and the inventor, was much appreciated

The new comers created a great deal of interest. The photograph depicts the the Rollo-Jap which was driven by O. C. Godfrey.

MOTOR CYCLES AT BIRMINGHAM TRADES EXHIBITION.

A Trades Exhibition was opened on the 25th ult. at Bingley Hall, and about a dozen stands were devoted to exhibits of motor cycles. The Kerry-Abingdon was in a glass case, which had a mirror back so that one could inspect both sides of the machine at once. Two models of the Sun were shown. Each was fitted with a 3¾ h.p. Precision unit. One had a Sturmey Archer three-speed hub and Turner sidecar. Robert Bruce, Ltd., were showing on Stand 108 a T.T. Quadrant. Stand 110 was devoted to the G.D.W. motor cycles. One model was fitted with a 2½ h.p. J.A.P. engine. Another had a 3¾ h.p. Precision. The "Rollo" runabout (W. C. Hyde, Stand 111) attracted a good deal of attention. Centaur and "O.K." Precision motor cycles also found a place on this stand. 3½ h.p. Trump motor cycles were shown. A 6 h.p. twin was also on view. Garrard and "Canoelet" side carriages completed the exhibits.

TIME TO LIGHT LAMPS.

April 4th	... ...	7.35 p.m.
,, 6th	... ...	7.38 ,,
,, 8th	... ...	7.42 ,,
,, 10th	... ...	7.45 ,,

English-Dutch Trial.

Entries for the Dutch trial, to be held in Holland on August Bank Holiday, close on Saturday, April 15th. Committees of leading motor cycle clubs are to be asked to choose the British teams.

Cut-outs Illegal on Cars.

This week the new Local Government Board Order prohibiting the use of exhaust cut-outs on cars came into force. We wonder how long it will be before a similar regulation is issued applying to motor cycles.

Soldiers and Reflex Lights.

The Military Authorities at Aldershot have issued an order that soldiers, when marching by night, shall carry a red reflex light as a precaution against being run into by motor vehicles. One of the soldiers in the rear file of each company on the march will carry a red reflex light at the back of his belt.

The Strength of the A.C.U.

The present membership of the Auto Cycle Union is as under:

Affiliated members (73 clubs) ...	3,437
Individual members	379
Touring members	1,503
	5,319

Obstruction by Tramcars.

The General Committee of the R.A.C. has voted one hundred guineas towards the cost of opposing the Bill that is being promoted in Parliament by the London County Council, seeking powers to run coupled and trailing tramcars upon their tramways system. It is felt that the present obstruction to the free passage of the road caused by tramcars would be seriously aggravated if the proposal of the L.C.C. were allowed by Parliament to be put into effect.

The following resolution was unanimously passed at the council meeting of the R.I.A. on the 22nd ult.:

"That this meeting, having considered the provisions of the London County Council (Tramways and Improvements) Bill, 1912, in regard to the use of trailer-cars, strongly opposes the granting to the Council of such powers in respect that the congestion of traffic in the streets of the County of London is largely due to the existing tramway traffic, and that the use of trailer-cars would, in the opinion of the Council of the Roads Improvement Association (Incorporated), very seriously aggravate such congestion."

Telegraph Poles on the Highway.

Owing to the accidents which have occurred in certain districts through telegraph poles being placed on the edge of the road instead of in the ditches at the side, the R.A.C. is making investigations with a view to the removal of this danger to those using the roads.

The Roads Improvement Association.

The lessees of the Dartford Light Railways have, as a result of representations from the R.I.A. respecting the unsatisfactory condition of a certain section of their tramway track from Bexley Heath through Crayford and Dartford to Stone, caused their permanent way engineer to make a special inspection, and have promised that the defects complained of shall be remedied forthwith.

Why the Deposit System was Inaugurated.

A Nottingham youth, named Arnold Sanders, has been sentenced to three months' imprisonment for a series of ingenious frauds. He advertised in *The Motor Cycle* a belt for 12s. 6d. It was contended in evidence that he had so many replies that he became confused in his methods, and forgot from which letters he received the postal orders. Consequently no one got the belt. Two persons who sent postal orders took action, and Sanders was arrested. Subsequently 19 cases were proved against the prisoner.

Compression Ratio.
B.M.C.R.C. Meeting at Brooklands.

To Prevent Knocking.

To obviate noise caused by endwise movement of the big end on the crank pin of car engines, Mr C. Y. Knight, the inventor of the Knight-Daimler slide valve engine, has patented a method of interposing fibre or other suitable rings between the big end and the cheeks of the crank. This might prevent some of the knocking one hears so often on a motor cycle engine which has been attributed to various causes but is usually associated with overloading and lack of lubrication and pre-ignition.

A New Zealander's Experience.

M.W.R. writes us from New Zealand that a few days ago a friend of his went for a run on his motor cycle when the engine suddenly stopped. Upon making an examination he found a blow-fly fixed between the top of the sparking plug and the petrol tank, thus short-circuiting the current. When removed the fly was found to be dead—electrocuted. A rather long sparking plug was being used, the space between the top of the plug and the underside of the tank being only a quarter of an inch.

AT BROOKLANDS IN THE 100 MILES ALL-COMERS' RACE.

A good struggle between two sidecars.

The new Members' badge, of distinctive design, adopted by the Coventry and Warwickshire Motor Club. It is to be presented free to all members on payment of their subscription.

Institution of Automobile Engineers.

At the next general meeting of the Institution on the 10th inst., Professor Morgan's paper on "Paraffin as Fuel" will be read in place of Mr. Guest's paper announced for that date.

A.C.C.F. Circuit de Paris.

In addition to the names published last week, the following have signified their intention of taking part in the Circuit de Paris: H. Lister Cooper (3½ Triumph) and G. Griffiths (3½ Multi Rudge). The English party now numbers fifteen.

A Hill-climbing Week-end.

The joint open hill-climb of the Harrogate and Herts. County Clubs, to be held on Saturday next, at Leathley Bank, has resulted in a large entry, the usual expert hill-climbers, most of whom were at Oakamoor last Saturday, having entered. The majority will afterwards make a move for Brigsteer Brow for the Westmorland Club's hill-climb on Easter Monday.

Auto Cycle Union Notes.

One-day Trial.—This trial will be re-run on the 24th inst., and will start from Oxford. The route is to be kept secret, but we are at liberty to say that it will not be of such an intricate nature as the last. There will be a class for cyclecars, which will be admitted under the same conditions as have been instituted for cyclecars in the Six Days' Trial.

Cyclecars in the Six Days' Trial.—These must not exceed a maximum weight of 7 cwts. complete with body. They must be fitted with a comfortable touring body, with lamps, an efficient silencer, effective mudguards, and a reasonably protected magneto. All cyclecars must be provided with a free engine device and a change-speed gear controllable from the seat when the vehicle is running.

Tourist Trophy Race.—Practising will be allowed from 5 to 7 a.m.

Timekeepers.—Messrs. A. V. Ebblewhite and D. K. Hall have been re-appointed timekeepers to the A.C.U. (subject to confirmation by the General Committee).

Entry Forms.—All entry forms filled in by riders of variable speed machines must in future show the number of speeds and the gear ratios.

Permits.—A permit has been granted to the Sutton Coldfield and Mid-Warwickshire A.C. to hold a hill-climb for amateurs on May 18th. A special permit has been granted to the M.C.C. to hold the inter-team trial for *The Motor Cycle* Challenge Cup on June 15th.

Silencer Regulations.—The Union is determined to do all in its power to cause manufacturers to turn out a reasonably silent machine. For the present, at all events, the following regulation should ensure that all machines taking part in competitions are tolerably quiet: "The judges of any open competition shall have power to disqualify any unduly noisy machine." This regulation is mainly drafted to strengthen the judges' hands at hill-climbing competitions.

FUTURE EVENTS

April 5-8.—N.W. London M.C.C. & Herts. County A.C. Joint Trial and Open Hill-climb (Yorks.) and Ladies' Competition.
„ 8.—Westmorland M.C.C. Open Hill-climb at Brigsteer Brow.
„ 13.—Oxford M.C.C. Hill-climb.
„ 13.—Liverpool A.C.C. Open Reliability Trial.
„ 20.—B.M.C.R.C. Race Meeting.
„ 20.—Bristol M.C.C. Open Hill-climb
„ 27.—Bristol B and M.C. Open Hill-climb
„ 27.—M.C.C. Open Silencer Trial.

Mr. F. Straight.

Mr. F. Straight, the retiring secretary of the A.C.U., has, we are informed, accepted a position with the Rover Co., Ltd., Coventry.

Further War Office Tests.

Mr. W. Pratt, we understand, easily succeeded in passing the War Office test at Brooklands last week on the occasion of his second attempt, as he covered a lap three miles an hour above the speed required on a 3½ h.p. P. and M. The failure on the first attempt was due to a stuck piston ring.

R.A.C. and Associated Clubs' Annual Dinner.

The yearly dinner was held at the Holborn Restaurant on Friday evening last. Among the prominent members of the A.C.U., which is affiliated to the parent body, were Colonel H. C. L. Holden, R.A., C.B., F.R.S., Messrs. Robert Todd, J. R. Nisbet, G. F. Sharp, and E. M. P. Boileau (*The Motor Cycle*). Speeches were made by Mr. A. Armitage, Sir John Macdonald, and Mr. Joynson-Hicks.

Hill-climb on Snaefell.

Considerable surprise has been caused in Liverpool motor cycle circles by an announcement on the Mersey M.C. programme of events that this club intends to hold an open hill-climb on Snaefell on the Saturday between the two Tourist Trophy Races. The Mersey Club applied for a permit to hold an open climb on the date mentioned, but the permit has, we are informed, not yet been granted. Motor cyclists generally will, we think, agree that any open event held in the T.T. week should be organised by the Auto Cycle Union.

DERBY AND DISTRICT M.C.C. HILL CLIMB AT OAKAMOOR.
Start of a heat. The starting banner may be seen in the distance.

A.C.U. Annual General Meeting of the Council.

THE annual general meeting of the Council of the A.C.U. was held at 89, Pall Mall, S.W., on Saturday afternoon last. It was preceded by a meeting of the Motor Cyclists' Progressive Association, at which the chairman of that body, Mr. Otto Thomas, explained, at some length, its aims and objects. Mr. Thomas clearly showed that the M.C.P.A. was an association formed inside the governing body. It would also ensure those provincial clubs who could not send their own delegates being represented by active and desirable men.

At 3 p.m. the annual general meeting of the Council of the A.C.U. began, under the able chairmanship of Mr. Robert Todd. Mr. H. P. E. Harding opened the ball by asking the chairman if there was anybody present who was not entitled to vote. The Chairman asked for someone to challenge Mr. Harding's statement, which Mr. W. H. Wells promptly did. Mr. Harding then named three members, whom Mr. Todd informed that they might be present though they could not vote.

Considerable time was then spent, on Mr. Harding's request, in reading the names of the various delegates of the R.A.C. private members and affiliated clubs, and the lists of proxies received. The minutes of the last meeting, and the report of the General Committee, were then passed, and the accounts submitted. Several questions were afterwards asked, which were answered by the treasurer, who moved the adoption of the accounts, and Mr. E. Nelson then enquired as to the fate of the funds of the Féderation Internationale des Clubs Motocyclistes. Mr. G. F. Sharp gave a brief history of the F.I.C.M., and reported that he held the funds for that body, the only surviving member of which was the A.C.U. It was suggested that the money should be spent in reforming the Federation.

The following proposition was then moved by Mr. V. Hart and seconded by Mr. F. A. Hardy, and carried:

To alter Rule 42 as follows:

11th line, after the words "affiliated clubs," to delete "each of whom must represent a different club," and to substitute, "who shall be nominated in accordance with a scheme the purport of which has already been circulated among the delegates. Pending the election of the club representatives, the existing club representatives on all committees are asked to continue in office. The election of officers and members of committees and sub-committees will be deferred until the first meeting of the General Committee after the election of the club representatives on the General Committee, the object of this being to ensure all affiliated club representatives having power to elect the Union officers.

Re-election of the President.

His Royal Highness the Duke of Teck was re-elected as president, and the vice-presidents were also re-elected.

Mr. W. H. Browne, in the place of Mr. Howard Smith, who was unavoidably absent, then moved "That the Auto Cycle Union compile an official list of names of gentlemen who are qualified and willing to act in the capacity of judges and timekeepers in various parts of the country, and to publish this list, together with full addresses, in the yearly Handbook." This was carried with a slight modification introduced by Major Lloyd. As the resolution could not be included in the Handbook this year it was agreed to circulate it.

Mr. H. P. E. Harding then proposed "That no member of the A.C.U. connected with the manufacture or sale of motor cycles, motor cars, or parts used on same, or advertising agents, be eligible to serve on the General Committee of the Union." Mr. Harding, in proposing this resolution, assured those present that he did so from no personal motives. Mr. Harding, after referring in somewhat sarcastic terms to the M.C.P.A., asked why many of its members who were on the committee had not made the A.C.U. what it should be? They had always had a majority. He could only think they had worked simply to get their own men on the committee. The speaker then mentioned that the chairman of the M.C.P.A. had thrown the blame of the failure of the one-day trial on the Competitions Sub-committee, and had asked what he was doing on that occasion. He then asked where the chairman of that Association was on that day. Why, he asked, should trade members be allowed to serve on the committee when the trade had a strong association of their own?

Mr. C. H. Hawkins seconded the motion in a most able manner, and dwelt at some length on the great work the A.C.U. had accomplished in the development of the modern motor cycle, and inferred that this could not have been effected but for the energy of the private owner.

Mr. Otto Thomas, in reply, said that the proposal had been drafted somewhat carelessly, as the words "advertising agent" had been included when the words "advertising matters" had been intended. It was characteristic of the work with which the proposer had been associated in the past. Mr. Harding had approved of the present state of the A.C.U. and the work it had done. Mr. Thomas ventured to disagree. He felt that all those who had the interests of motor cyclists at heart must make for the better management of the A.C.U. He then spoke of the assistance the trade had given to the Union. He desired to see members of the trade on the committee, provided they worked hand in hand with the other members. At the conclusion of this speech there was prolonged applause.

The A.C.U. and Trade Members.

Mr. Nisbet said, as to the trade, he was steeped to the eyes in it. It was in thorough sympathy with the A.C.U. Mr. Harding had referred to the trade organisation, and had asked why the trade should serve on the A.C.U. committee if it had an organisation of its own. To that he replied the trade did not impose rules, but only made suggestions.

Mr. Moorhouse read a letter from Mr. Baynes, of the Manchester club, which had threatened to terminate its agreement with the A.C.U. He would try to avoid this after knowing the work the M.C.P.A. had done. Mr. Moorhouse spoke of the opposition shown by the northern clubs in the past, and how since the formation of the reforming body the Northern League had been disbanded.

Major Lindsay Lloyd explained how the R.A.C. treated the matter; how it always felt it was better to have the trade on the committee and with you than outside and against you.

Mr. Harding then replied; and Mr. Todd made a few remarks from the chair. He attached great importance to the matter, but he thought Mr. Harding had gone too far. He also echoed Major Lloyd's statements.

The proposal was then put to the meeting, and the voting was 6 for, 50 against. Proxies were then asked for, and the voting was 47 for, 83 against.

Some 1912 Fixtures.

Mr. A. R. Hunter then proposed that the following fixtures be promoted by the Union during 1912: Annual race meeting; inter-team reliability trial.

Mr. W. H. Browne (for Mr. Howard Smith), on behalf of the Sutton Coldfield club, and Mr. Shaw Scott, of the same club, spoke in support of the motion as regards the inter-team trial.

Eventually Major Lloyd suggested an amendment that it be an instruction to the General Committee to consider the holding of the team trial, which was carried unanimously.

The final proposal on the agenda, "That the name of the Nottingham and District Local Centre be changed to the East Midland Local Centre," was proposed by Mr. J. King, of the Nottingham and District M.C.C., and carried unanimously.

COVENTRY & WARWICKSHIRE M.C. OPEN TRIAL.

Quite a novel scheme has been decided upon in connection with the above club's open trial, on May 4th. Usually, in the case of secret courses, the route is announced either the day prior to the event or on the morning, but the committee has decided not to publish or announce the route at all. Officials will precede the competitors and erect arrows at every doubtful corner and use a paper trail where necessary, and competitors will be despatched with instructions to follow the marked route. A number of steep hills will be included in the 150 miles course (which must be covered without an involuntary stop). There will be three classes: 1, motor bicycles; 2, sidecars; 3, cyclecars. In addition to prizes for the best performance in each class, there will be special awards for the best performance by an amateur, the best performance by a club member, and also for the best performance on a single geared machine.

Brooklands Easter Monday Meeting.

BELOW will be found the entries for the two motor cycle races to be held by the Brooklands Automobile Racing Club on Easter Monday next.

2.25 P.M.—THE SIXTH SHORT MOTOR CYCLE RACE.

K. Vaughan (1-cyl. Triumph)	85 × 88
E. T. Bolton (1-cyl. Rudge)	85 × 88
D. C. Bolton (1-cyl. Rudge)	85 × 88
W. D. Dewar (1-cyl. Triumph)	85 × 88
M. Campbell (1-cyl. Triumph)	85 × 88
S. C. Winfield-Smith (1-cyl. S.I.A.M.T.)	— —
H. E. Govet (2-cyl. Humber)	60 × 60
V. Wilberforce (2-cyl. Zenith)	76 × 54½
A. J. Walker (1-cyl. Rudge)	85 × 88
S. R. Axford (1-cyl. J.A.P.)	80½ × 60
E. Barnfather (1-cyl. Croydon-Whitgift)...	80½ × 60
W. Stanhope-Spencer (1-cyl. Rudge) ...	85 × 88
W. H. Elce (1-cyl. Rudge)...	85 × 88
W. Pollard (1-cyl. Quadrant)	81½ × 88
H. Martin (1-cyl. Martin)	76 × 59½
W. O. Oldman (2-cyl. Bat)	76 × 54½
J. H. Manners-Smith (1-cyl. Triumph) ...	85 × 89
G. E. Stanley (1-cyl. Singer)	69 × 80
N. A. Ayres (1-cyl. Singer)	69 × 80
R. N. Stewart (1-cyl. Rudge)	85 × 88
R. Cooke (1-cyl. Rudge)	85 × 88
W. W. Douglas (2-cyl. Douglas)	61 × 60
E. Kickham (2-cyl. Douglas)	61 × 60
G. H. Hunter (2-cyl. Zenith)	90 × 77½
H. Hunter (2-cyl. Corah)	90 × 58

3.50 P.M.—THE FIFTH LONG MOTOR CYCLE RACE.

S. C. Winfield-Smith (1-cyl. Singer) ...	85 × 88
E. T. Bolton (1-cyl. Rudge)	85 × 88
D. C. Bolton (1-cyl. Rudge)	85 × 88
W. Dewar (1-cyl. Triumph)	85 × 88
M. Campbell (1-cyl. Triumph)	85 × 88
H. E. Govett (2-cyl. Humber)	60 × 60
A. J. Walker (1-cyl. Rudge)	85 × 88
S. R. Axford (1-cyl. J.A.P.)	80½ × 60
E. Barnfather (1-cyl. Croydon-Whitgift)	80½ × 60
W. Stanhope-Spencer (1-cyl. Rudge) ...	85 × 88
W. H. Elce (1-cyl. Rudge)	85 × 88
W. Pollard (1-cyl. Quadrant)	81½ × 88
H. Martin (1-cyl. Martin)	76 × 59½
W. O. Oldman (2-cyl. Bat)	76 × 54½
J. A. Manners-Smith (1-cyl. Triumph) ...	85 × 89
G. E. Stanley (1-cyl. Singer)	85 × 88
N. A. Ayres (1-cyl. Singer)	85 × 88
R. N. Stewart (1-cyl. Rudge)	85 × 88
R. Cooke (1-cyl. Rudge)	85 × 88
W. W. Douglas (2-cyl. Douglas)	61 × 60
E. Kickham (2-cyl. Douglas)	61 × 60
G. F. Hunter (2-cyl. Zenith)	90 × 77½
H. Hunter (2-cyl. Corah)	90 × 58

CLIMBING ARTHUR STREET, EDINBURGH.

A 3½ h.p. 1912 pattern Humber climbing the 1 in 4 gradient of Arthur Street, Edinburgh, with a sidecar and passenger. The driver is A. G. Fenn, who has been in Scotland for a month climbing the notorious hills in the neighbourhood of Edinburgh and Glasgow.

M.C.C. Land's End Run.

A RECORD entry of 86 machines has been received for the Land's End run at Easter A supper will be prepared at the Bridge House Hotel, Staines, at 8.30 on Friday night, the start taking place from that hotel at 3 o'clock on Saturday morning. There will be a control in Exeter, in which city 1 hour 15 minutes will be allowed for lunch and replenishments, and for crossing the town. A pretty and mountainous section, but one requiring great care, will be included between Ashburton and Two Bridges. 16½ hours will be allowed for the outward trip, and 15 returning. Below we give a complete list of the entries:

Southcomb May (8 Portland-Jap)
G. E. Purchase (3½ Triumph)
F. J. Watson (3½ Swift)
S. G. Frost (4½ V.S.-Jap)
E. Gwynne (3½ Triumph)
E. Pond (3½ Rudge)
G. Brough (6 Brough)
G. G. C. Pigott (5-6 Zenith)
V. Olsson (6 Trump-Jap)
A. G. Peppercorn (3½ Bradbury)
L. A. Baddeley (7 Indian)
D. S. Baddeley (——)
A. Dickinson (3½ Triumph)
E. L. Mather (5-6 F.N.)
H. Karslake (3½ Rover)
G. L. Fletcher (2¾ Douglas)
F. C. North (3½ Ariel)
H. Greaves (2¾ Royal Enfield)
S. C. Perryman (3½ Ariel)
B. Alan Hill (7 Indian sc.)
J. S. Holroyd (2½ Motosacoche)
A. J. Sproston (3½ Rudge)
W. Pratt (3½ P. and M.)
W. Cooper (3½ Bradbury)
C. Patteson (2¾ Moto-Rêve)
H. R. Deighton-Simpson (—)
J. Haswell (3½ Triumph sc.)
W. B. Gibb (2¾ Douglas)
S. F. Garrett (3½ Premier)
A. G. Barr (3½ Quadrant)
G. B. Fry (3½ Quadrant)
F. C. Wasley (2¾ Douglas)
P. Grout (4½ Quadrant)
P. H. Bentley (3½ Triumph)
R. Davis (8 Chater-Lea sc.)
H. G. Slingo (5-6 Clyno sc.)
A. M. Scott (3½ Triumph)
G. T. Gray (3½ Rudge)
Frank Smith (5-6 Clyno sc.)
P. Phillips (2¾ Douglas)
P. W. Moffat (2¾ Douglas)
J. Milner (7 Indian)
E. O. Babington (6 Bat)
S. Saunders (3½ Rudge sc.)
J. A. Neuman (3½ Rudge sc.)
R. Lord (6 Rex sidette)
H. R. Whitmore (3½ Rudge)
E. J. Hancock (3½ Premier)
T. H. Birdsall (3¾ Premier)
C. Meredith (3½ Bradbury)
W. C. Hemy (3½ Service Precision)
F. S. Proctor (7 Indian sc.)
G. Boswell (3½ Ariel)
H. Gibson (3½ Bradbury sc.)
R. C. Owen-Wells (3½ Bradbury.
H. C. Mills (3½ Premier)
C. Q. Roberts (3½ Rover)
E. Ware (8 Chater-Lea sc.)
N. O. Soresby (3½ Rudge)
P. W. Tippett (3½ Humber)
H. Patteson (2¾ Douglas)
C. Percival (6 Zenith sc.)
A. T. Tamplin (6 Matchless sc.)
S. Savage (3½ Triumph)

N. C. Dear (2¾ Douglas)
R. Croucher (3½ Kerry-Abingdon)
A. P. Maurice (3½ Premier)
S. J Bellchambers (3½ Rover)
A. V. Deacock (6 N.L.G.)
J. Stevens (2½ A.J.S.)
A. J. Stevens (5 A.J.S. sc.)
B Haddock (2½ A.J.S.)
F. Begley (2¾ Jap)
Hartridge (5-6 F.N.)
J. H. Kerr (3½ F.N.)
C. Bailey (3½ Rudge)
J. V. Robinson (4¼ Ivy Precision sc.)
H Burton (3½ Rudge)

CLUB NEWS.

Mersey M.C.

The club held a highly successful hot-pot supper followed by a "smoker" on Thursday, March 28th. A run to Kendal will be organised for the Easter holidays.

Walthamstow M.C.

The above club held its annual supper at the Essex Hotel, Walthamstow, on the 29th ult. A large muster of members and friends were present.

Burnley A.C.

A meeting was held on Tuesday evening, the 19th ult. The club's first contest is a hill-climb, to be held on April 20th, particulars of which will be given later. The officials for this season are: Messrs. E. Brown (hon. secretary), G. Pickup (hon. treasurer), and J. V. Saunders (assistant hon. sec.)

Surrey M.C.C.

The result of the speed-judging competition, held on the 27th ult., was as follows: 1, G. S. Williams (3½ Arno); 2, F. J. Houghton (3½ Trump-Jap); 3, H. R. Owtram (3½ Triumph). The competitors were timed over an unknown distance of ten miles from Alfold to Horsham.

Middlesbrough and District M.C.C.

In the last issue Mr. Geoffrey W. Liddle was wrongly described as the hon. secretary. He was the hon. press secretary, but has now resigned his position. The present hon. secretary is Mr. G. W. Goult, 29, Borough Road, West Middlesbrough.

Essex M.C.

On the 31st ult. a good attendance was put in for the penalty run to Clacton-on-Sea—a non-stop run of sixty-five miles—and the following qualified for the club medal: A. E. Brassington (6 h.p. Rex sidette), G. L. Fletcher (2¾ h.p. Douglas), C. Pearson (2¾ h.p. Douglas), Miss R. Hammett (2¾ h.p. Douglas), C. Michell (3½ h.p. P. and M. and sidecar), A. E. Uffleman (3½ h.p. Humber), A. M. Richards (3½ h.p. Humber), H. Karslake (3½ h.p. Rover), and B. C. de W. Siffken (2¼ h.p. S.I.A.M.T.).

Fleet M.C.C.

The club held speed trials on Hartford Bridge Flats at 7 a.m. on the 30th ult. The winners were as follow:

Class I. (open).—1, A. A. Longley (5 h.p. Indian); 2, Lieut. Smith (3½ h.p. Singer).

Class II. (touring machines up to 500 c.c.)—1, T. E. Little (2¾ h.p. Douglas); 2, A. Nelson (3½ h.p. Kerry).

On Easter Monday a hill-climb will be held, starting from the Oatsheaf Hotel at 10 a.m.

Woolwich, Plumstead, and District M.C.

The annual hill-climb took place on the 25th ult., at Hog Trough Hill, Brasted, Kent, the run being just over half a mile. Out of twenty-seven entries only seventeen faced the starter. The event was run off on the knock-out principle, viz., each competitor had a preliminary run up the hill and was handicapped on the time he took to climb it. Any competitor exceeding his time by more than five seconds was disqualified. Final won by H. A. Collier, 8 h.p. Matchless (sidecar and passenger), time 59⅖ seconds. In the contest for fastest time between S. Davis (3½ Rudge) and H. Cork (5 T.T. Matchless), H. Cork ultimately won in the time of 43⅖ seconds.

Bedford and District M.C.C.

The reliability run *viâ* Stamford, Uppingham, Kettering, and Rushden took place on the 31st ult. The ease with which the lightweights ascended Rockingham Hill was a revelation to the onlookers. Mrs. Kirkpatrick rode very well, and was leading on points until the last section, when repeated plug trouble put her out of the running. All the singles with one exception ascended Rockingham in style. Results:

Lightweights.—1 (silver medal), C. W. Jamison (2¾ New Hudson), 198 marks; 2, F. Waring (2¾ Enfield); 3, Mrs B. Kirkpatrick (2¾ Douglas).

Single-cylinders.—1 (gold medal), H. J. Woods (F.E. Triumph), 200 marks; 2 (silver medal), W. W. Edwards (T.T. Triumph), 199 marks; 3, R. G. Parker (3½ Bradbury), 198.

Big Twins.—1 (silver medal), E. Auger (5 Peugeot), 198.

Sidecar machines.—1 (silver medal), A. Wilkinson (two-speed Bradbury), 180 marks.

Herts County A.C. (Motor Cycle Section).

On Saturday, the 30th ult., the motor cycle section held a members' hill-climb on Aston Hill, near Tring. Fastest time of the day was accomplished by F. W. Barnes (viz., 45⅖s.) on a 6 h.p. Zenith. Formula results:

DIVISION 1.

Class 1.

1. F. W. Barnes (2¾ Zenith) | 3. F. W. Applebee (2 Centaur
2. W. A. Jacobs (2½ Singer) | 4. W. Atkin (2½ Gradua)

Class 2.

1. F. Applebee (2¾ Centaur) | 2. A. J. Parkes (2¾ Enfield)

Class 3.

1. F. W. Barnes (2¾ Zenith) | 3. G. F. Cooper (3½ Triumph
2. A. J. Dixon (3½ Zenith) |

Class 4.

1. F. W. Barnes (2¾ Zenith) | 3. A. J. Dixon (3½ Zenith)
2. W. A. Jacobs (2½ Singer) |

Class 5.

1. V. Wilberforce (3¾ Zenith) | 3. A. J. Luce (6 Zenith)
2. F. W. Barnes (6 Zenith) | 4. E. A. Colliver (6 Zenith)

Class 6 (on time).

W. H. Elce (Rudge), 50s. | F. W. Barnes (Zenith), 52⅕s.
G. F. Cooper (Triumph), 50⅕s. |

Class 7.

E. A. Colliver (6 Zenith), 51s. | G. Carter (5 Matchless), 51⅕s
V. Wilberforce (3¾ Zenith), 51s. | A. J. Luce (6 Zenith), 51⅖s.

Class 8.—Passenger machines.

1. F. W. Barnes (6 Zenith) | 2. E. G. Attenborough (
Indian)

Class 9.—Any machine (on time).

F. W. Barnes (6 Zenith), 45⅖s.* | G. F. Cooper (Triumph), 49⅕s
K. Yano (5 Bat), 48⅘s. | E. A. Colliver (6 Zenith), 49⅖s

*Fastest time of the day.

Class 10.

F. W. Barnes, 45⅖s.* | G. F. Cooper, 49⅕s.
K. Yano, 48⅘s. |

*Fastest time.

DIVISION 2.

Class 2.

1. V. Wilberforce (3¾ Zenith) | 2. K. Yano (5 Bat)

Class 3 (on time).

S. Yano (Rudge), 48s. | H. C. Worstam (Chater-
H. L. Baige (Rudge), 53s. | Precision), 1m. 2⅕s.
H. Meyer (Triumph), 55⅖s. |

R. A. Bishop, of Oxford, climbing Arms Hill, near Henley on a 6 h.p. Enfield sidecar with passenger. This is the first ascent by a passenger machine.

Club News.—

Hampshire M.C.U.

The opening run will be to Salisbury (White Hart Hotel) to-morrow, the 5th inst.

Batley and District M.C.C.

On the 21st ult. Mr. J. Hazzlewood lectured at headquarters on "Internal Combustion, Total Exhaust, and Variable Compression."

Kildare M.C.C.

Efforts are being made to found a club for motor cyclists in Co. Kildare. All who wish to join should apply to Mr. F. V. Devere, Naas, Co. Kildare.

Crawley M.C.C.

It is proposed to form a motor cycle club with the above title. All who wish to join should apply to Mr. W. Nightingale, jun., Hazeldene, Crawley.

Newcastle and District M.C.

April Competitions.—5th: Rothbury, with surprise competition at Rothbury. Dinner, Queen's Head Hotel, 12.30. 8th (Easter Monday): Kendal, to witness Westmorland Motor Cycle Club hill-climb at Brigsteer Brow. 28th: Team trial (three in a team), Penrith and back.

Essex M.C.

On Friday, the 22nd ult., a supper was given at headquarters to Mr. O. L. Summers, who has for many years been captain of the club, and who is about to depart for Canada. A small wristlet watch was presented to him during the evening as a memento of the club's appreciation of his work amongst them.

Middlesbrough and District M.C.C.

On Friday evening, March 22nd, at headquarters, Corporation Hotel, some thirty-three members assembled to hear a lecture by Mr. S. Stansfield entitled "The Internal Combustion Engine; Some Notes on Actual and Possible Performances." Mr. Geoffrey W. Liddle occupied the chair, and a hearty vote of thanks was accorded Mr. Stansfield, on the motion of Mr. E. Young, supported by Mr. H. Beckwith.

North Staffordshire M.C.C.

The first hill-climb of the season was held on the 23rd ult., at Penny Leasow. Twenty-six entries were received, and in spite of the bad weather there was a fair gathering of spectators. Messrs. Cotterill and Hesp rode well. The fastest time of the day, made by the latter, works out at 38½ m.p.h. Results (Classes I. and II.) on formula:

Class I. (under 350 c.c.): 1, A. Cotterill (2¾ Zenith); 2, Hesp (2½ Premier).

Class II. under (560 c.c.): 1, A. Cotterill (2¾ Zenith); 2, J. A. Prendergast (3½ Rudge).

Fastest time: 1, Hesp (3½ Premier), 46⅘ secs.; 2, J. A. Prendergast (3½ Rudge), 47½ secs.

Woolwich, Plumstead and District M.C.

The Easter tour is to Cheddar, starting on Saturday morning and returning on Monday.

Hunslet M.C.C.

Any motor cyclist wishing to join this club is requested to apply to Mr. G. Megson, Swallow Cycleries, Low Road, Hunslet. The headquarters will be the Swan Hotel. A general meeting will shortly be held.

Cambridgeshire M.C.C.

Members are reminded that the club photograph will be taken to-morrow, the 5th inst. Meet near the Botanic Gardens 9.45 a.m. On that day the club run will be to Luton (lunch) and Hatfield (tea).

The Motor Cycling Club.

The headquarters for Easter will be the Mermaid Hotel, Yeovil. This has been selected as in previous years because it is on the route of the Jarrott Cup Competition. Members will start from the Cricketers' Arms, near Bagshot, at 9 a.m., on Friday, April 5th, and luncheon will be taken at the Red Lion Hotel, Salisbury.

Western District M.C. (London).

The club run to Reigate was a great success. After dinner in Reigate some members explored the famous caves. On the way home Pebblecombe Hill was visited, and proved too steep for some of the machines.

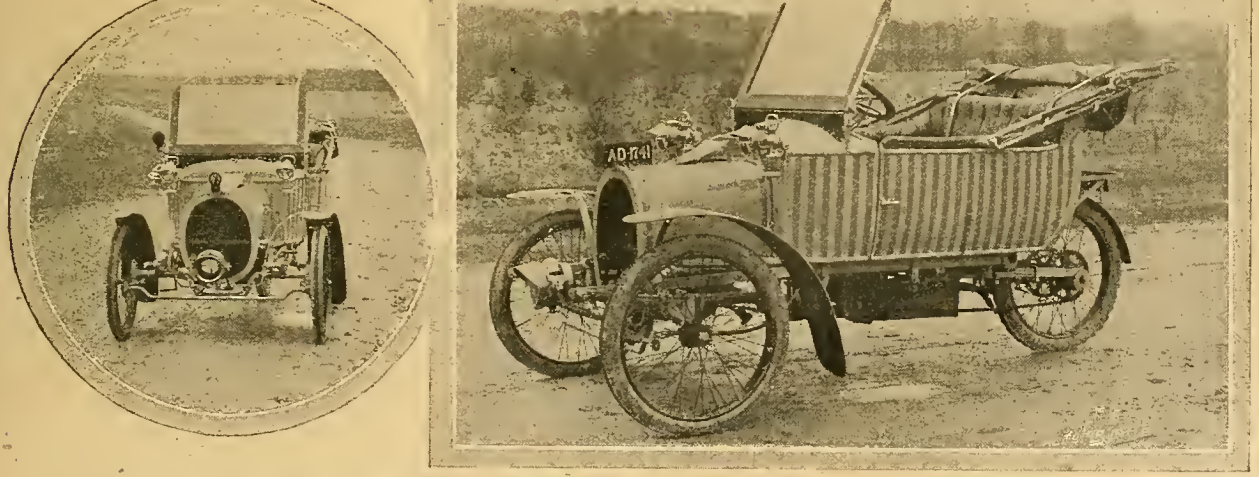
Lincolnshire A.C. (M.C. Section.)

A hill-climb will be held at Station Hill, Leadenham, on Easter Monday. There will be four classes: No. 1, under 400 c.c.; No. 2, under 600 c.c.; No. 3, over 600 c.c.; and No. 4, variable gear. Results will be calculated on the formula, $\frac{C \times t^{1.5}}{W}$. For all information apply to the hon. secretary, Mr. W. J. S. Bament, National Provincial Bank, Lincoln. The membership of the club has now reached one hundred.

Surrey M.C.C.

The following fixtures for April have been arranged:

April 6-8th (Saturday to Monday).—Easter tour to the New Forest and to Weymouth.

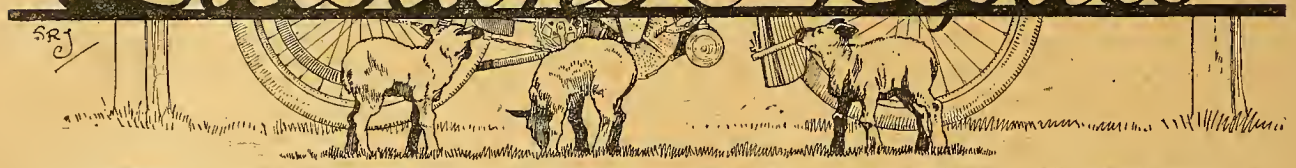


April 20th (Saturday).—Tour of local hill-climbs starting from headquarters at 3.30.

April 24th (Wednesday).—Members' hill-climb. Rules and entry forms will be issued at an early date.

Harrogate and District M.C.C.

The first event of the season will be the opening run to-morrow (Friday) to Richmond. On Easter Saturday the Harrogate and Herts County open hill-climb will be held at Leathley Bank.



On Easter Monday the inter-club hill-climb between Harrogate and Scarborough will take place at Staxton, near Scarborough.

A NEW THREE-WHEELED CYCLECAR.

The two-seater illustrated is an 8 h.p. Lambert, with three-speed gear and sociable seats. It is built by Lambert and Son, of Castle Street, Thetford.

Questions & Replies

A selection of questions of general interest received from readers and our replies thereto. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal queries should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Easy Starting.

Can you inform me if an Amac decompressor would cause easier starting on a big twin (1911)? Would each cylinder require one? —J.E.T.

(1.) The device in question would make the machine start more easily. (2.) Yes, you would require one in each cylinder.

Mold to Cockermouth.

I should esteem it a favour if you would give me the best route from Mold (Flintshire) to Cockermouth (Cumberland), with distances. If you direct me through Liverpool can I avoid going through the thick of the traffic?—W.L.

Your best route would be as follows: Chester, Frodsham, Runcorn, across the Transporter Bridge to Widnes, then go through Rainhill, Rainford, Ormskirk, Rufford, Longtown to Preston. This will avoid most of the bad traffic, though, of course, it is not an ideal route. However, it is better than going through Liverpool, Warrington, or Wigan. From Preston continue through Garstang, Lancaster, Kendal, Ambleside, Keswick, to Cockermouth. The distance is nearly 150 miles.

Use of Different Gears.

I have an 8 h.p. Jap engine and Chater-Lea sidecar complete, the makers' No. 7, and have had no trouble with it. What I want to know is which is the best gear to drive on downhill, top, second, or low, also should the spark be retarded or advanced? (2) When going through traffic on low gear, if the spark is fully advanced it is rather noisy, but if I retard it it quietens the engine. I want to know whether it injures the mechanism in any way. (3.) Does it affect the petrol consumption at all, or does the high, low, or medium speed, use about the same quantity?—P.M.H.

(1.) It depends upon the hill. If you are going down a long hill of which you can comfortably see the bottom, you can let the engine run down on top speed; if the hill is fairly steep, use the second speed; if the hill is precipitous, use the low speed. This saves the brakes, and it is advisable to run down with the switch off (2.) You may certainly retard the spark somewhat in traffic. It does not injure the engine in the slightest degree, but, of course, to drive habitually with the spark retarded would tend to overheating and a large consumption of petrol. (3.) The higher the gear the less petrol is used.

Valve and Magneto Timing.

I recently purchased a 1912 machine (T.T. engine). It runs badly, and overheats fearfully, but has covered four hundred miles, and should be doing well. With magneto fully advanced, the spark occurs just as the piston reaches the top of the compression stroke. The exhaust valve opens when the piston is fully 1¾in. from the bottom of firing stroke, but closes when the piston is just on the top of exhaust stroke. Surely this must be wrong. The inlet valve opens on the top, but does not close until the piston has come about an inch or so up on the compression stroke. It seems to me to be a case of fresh cams. What can I do to improve matters?—C.B.R.

The timing of your engine is certainly very remarkable. The magneto timing is quite sufficient alone to cause the trouble. The spark should occur at the top of the compression stroke, when the magneto is retarded, not when fully advanced. We presume you are not confusing advance and retard. To retard, you must move the ring carrying the segment in the same direction as the armature revolves. The magneto can easily be retimed, and we should advise you to do this first, and let us know the result. The valve timing is very unusual, too, but more will be known about this interesting subject shortly. You will find diagrams of the usual settings on page 256 of our issue of March 7th, where you will see that the exhaust opens 45° before the bottom of the firing stroke; this in your case would be half an inch. If the valve timing has to be altered, new cams will be required.

C. T. Newsome, who has been practising on Brooklands track on a 3½ h.p. T.T. Rover. He attained a speed of a mile a minute with apparent ease.

Kensington to Wigton (Cumberland).

What is the best route from Kensington to Wigton (Cumberland)?—R.D.

We should recommend the following routes: A.—Kensington, Regent's Park, Hatfield, Stevenage, Baldock, Biggleswade, Stilton, Stamford, Grantham, Newark, Tuxford, Retford, Doncaster, Ferrybridge, Aberford, Harewood, Otley, Skipton, Settle, Ingleton, Kirkby Lonsdale, Kendal, Windermere, Ambleside, Grasmere, Dunmail Raise (fairly steep), Thirlmere, Keswick, Bassenthwaite Lake, Bothel, to Wigton. B.—Follow A almost to Harewood, where keep straight on through Wetherby, Boroughbridge, Scotch Corner, Barnard Castle, Middleton-in-Teesdale, over the Pennines (rough and steep) to Alston, Brampton, Carlisle, and Wigton. Personally we should prefer A as being the more picturesque.

4½ h.p. Single and Sidecar.

I am thinking of buying a new machine and sidecar. As a constant reader of your valuable paper, I gather that you favour a twin-cylinder for sidecar work, but I am afraid of the cost of upkeep of a twin and greater complications. I shall be much obliged if you will give me your opinion on the following points: (1.) Would a 4½ h.p. single cylinder with a three-speed gear and clutch be satisfactory for sidecar use? (2.) Would this go slowly in traffic on the low gear? (3.) Do you think the Armstrong three-speed gear satisfactory and unlikely to get out of order if not tampered with? (4.) Would a 4½ h.p. single-cylinder be very noisy if fitted with an efficient silencer? (5.) Number of miles per gallon of petrol for a 4½ h.p. single.—A.W.F.

(1 and 2.) A 4½ h.p. with three-speed gear would do well with a sidecar, and you would have no difficulty about controlling in traffic. (3.) The special sidecar gear is satisfactory, and would stand this horse power. (4.) The machine would not be very noisy if fitted with an efficient silencer. (5.) You could hope to do about seventy miles to the gallon.

"YOU RUN NO RISK."

THE "J.P. 3,000" MOTOR CYCLE COVER FOR LONG DISTANCE TOURS.

The Improved

"ACME"

MOTOR CYCLIST'S COAT.

In Grey or Brown Frieze, lined throughout, fitted with our new Multi Collar and Duplex Wind Cuffs.

HUTCHINSON TYRE CO., 70, BASINGHALL STREET, LONDON, E.C.

AT BROOKLANDS

On Wednesday, March 27th, 1912—All the winning machines (belt-driven) were fitted with

LYCETT'S LYSO BELTS

Including the following:

SIDECAR SCRATCH RACE.
1st. F. W. Barnes on a Zenith.
3rd. S. T. Tessier on a Bat-Jap.

100 MILES RACE.
Class C, with Sidecar.
1st. F. W. Barnes, Zenith.
2nd. J. S. Bashall, Bat.

100 MILES RACE. Class B.
Lightweight Class.
1st. S. Wright, Humber.
2nd. A. E. Woodman, Humber.
3rd. A. Bashall, Humber.

Class C. 3½ h.p. S.C.
1st. E. B. Ware, Rudge,
3rd. W. S. Guiver, Rudge.
4th. S. D. Timpson, Rudge.

THE DAY RECORDS.

F. W. Barnes on a Zenith with sidecar.

ONE HOUR RECORD—49 miles, 1,283 yds.
FIFTY MILES—One hour, 18 secs.
TWO HOUR RECORD—96 miles, 1,594 yds.
100 MILES—2 hours, 3 mins., 42 secs.

TO WIN COMPETITIONS YOU MUST USE A LYSO—the pliable and power giving belt. Write for particulars. All the above used LYSOS.

LYCETT, THE SADDLERIES, BIRMINGHAM.

When to have Engine Re-bushed.

I have now got my 3½ h.p. Triumph engine down for overhauling and find that both ends of the connecting rod are a very little bit slack. Could you inform me what should be the maximum amount of play allowed in these bearings before having them rebushed? Also, if I send the rod to the makers to be rebushed, will it be necessary to send the crank and gudgeon pins, or will they replace with standard bushes?—E.L.A.

It is about time to rebush the engine when an appreciably audible knock is heard. If you send the connecting rod to the makers, send them also the crank and gudgeon pin. The standard bushes might be too large, as there might be a slight amount of wear in the old parts.

Repairing Cracked Valve Seatings.

I notice in *The Motor Cycle* advertisements that cracked exhaust valve seatings can be repaired by the West London Welding Co., Essex Place, Chiswick. I should be very much obliged to you if you would let me know if it is quite satisfactory, as I do not want to throw my money away on a useless job?—P.H.

There is no reason why the firm in question could not do the job satisfactorily, provided, of course, it can be done. Whether or not this is the case, it is impossible for us to tell without actually seeing the cylinder. What you had better do is to send the cylinder to the firm mentioned above or describe the breakage to them and get them to give you an estimate for this repair. If they cannot repair it they will tell you.

Two Routes.

(1.) Please give me the best route from Worthing to Leckhampton, Gloucestershire, also mileage? I should like to avoid all bad hills, as I shall take a heavy passenger in sidecar. My machine is a 3½ h.p. two-speed Bradbury. (2.) Also best route and mileage from Worthing to Callington, Cornwall. (3.) How far ought I to go the first day (from Worthing to Callington)?—A.C.

We have pleasure in giving you the following route: Worthing, Arundel, Chichester, Havant, Fareham, Bishop Waltham, Winchester, Andover, Ludgershall, Marlborough, Swindon, Cricklade, Cirencester, thence follow the Cheltenham Road to Leckhampton. The distance is approximately 140 miles. We do not think there is anything on this road to stop a 3½ h.p. Bradbury and sidecar. From Worthing to Callington your best route would be, as before, to Fareham, then on through Botley, skirting Southampton, Totton, Cadnam, Wimborne, Dorchester, Bridport, Lyme Regis, Colyford, Exeter, Crediton, Okehampton, Tavistock to Callington. The distance is approximately 212 miles. A shorter and prettier road is *viâ* Moreton Hampstead and Two Bridges, but this is very hilly. How far you ought to go on the first day depends entirely on the capabilities of yourself and your machine. If you propose to take two days, we should recommend you to do about 140 miles on the first day.

St. Leonards-on-Sea to Leicester.

Please let me know the nearest and best way to get to Leicester from St. Leonards-on-Sea, and also the distance. I have a 7-9 h.p. twin Chater-Jap and sidecar, which will take any hill.—F.P.

Your best route would be as follows: St. Leonards, Pevensey, Lewes, Ditchling, Partridge Green, West Grinstead, Billingshurst, Chiddingfold, Milford, Elstead, Farnham, Odiham, Reading, Streatley, Wallingford, Oxford, Banbury, Daventry, along Watling Street till you meet the signposts directing you to Lutterworth, and go through Lutterworth to Leicester. The distance is nearly 200 miles.

The Tax in Ireland.

There is a widespread idea prevalent here that the tax on motor cycles of £1 per year is not legally enforceable, as the Act under which the tax is payable does not apply to Ireland. A number of motorists state that they do not intend to pay any tax, and will let the authorities take action if they choose so to do. I should be glad if you would please put the matter before your legal adviser, and answer through the columns of *The Motor Cycle*, as it is of interest to motor cyclists in Ireland. —E.D.W. (Co. Antrim).

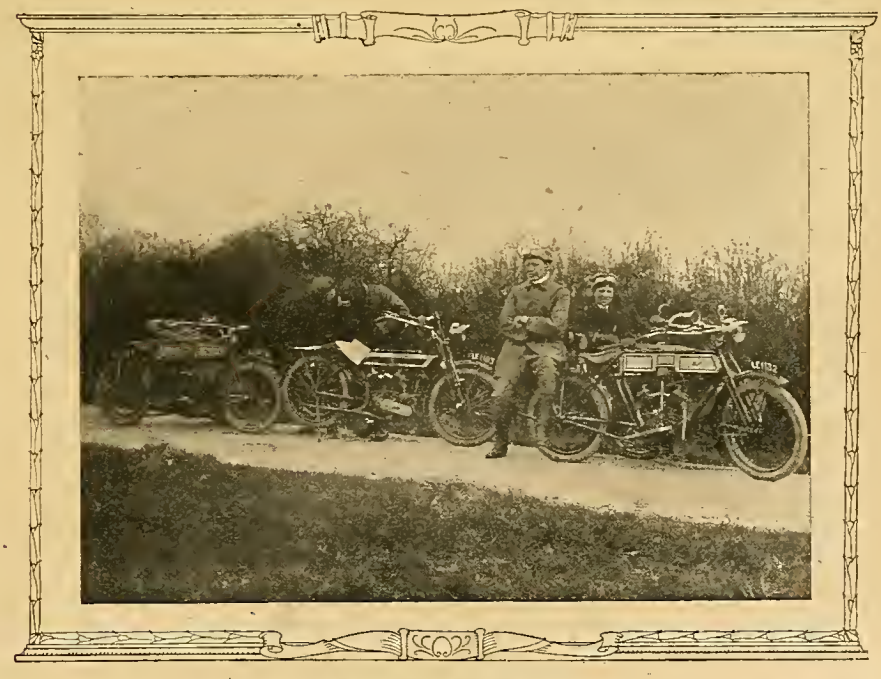
The Finance Act of 1910 imposing the fresh duties on motor cars and motor cycles expressly provided that the rates specified should be charged throughout the United Kingdom. Residents in Ireland, therefore, are in the same position as those living in England, and the duty must be paid. We have read the provisions in the Union with Ireland Act, 1800, but cannot find that the Act recently passed is contrary to that, and even if it were, a subsequent Act of Parliament takes precedence over a prior one if they are contradictory.

Opinion of the Humber Twin.

Please give me your opinion of the 2¾ h.p. twin Humber lightweight motor cycle. I am offered this Humber from stock by a firm of dealers, so wrote them for particulars; also wrote the Humber Co. One thing I asked each was the make of magneto. The dealers reply the small 1911 Bosch, the makers say Eisemann ordinary pattern. If the machine is fitted with the small Bosch, would this be as efficient and have as long a life as the larger types? If Eisemann, is this, in your opinion, as good as the Bosch? With regard to the Armstrong three-speed fitted, would you advise this as being as good as any other hub or counter-shaft gear? The gears Humber Co. give are 3¾, 5, 7¼ to 1. I presume these could be lowered to, say, 5, 7, 10 to 1 by opening the adjustable pulley?—F.W.E.

It does not matter if the machine is fitted with an Eisemann or Bosch magneto; both are equally good. Originally a Bosch magneto was fitted, but Eisemanns are being used at present. We have a very high opinion of the machine, and the gear is excellent in every respect. You could not possibly do better. The gear ratios, of course, could be raised or lowered by altering the adjustable pulley.

EXPERIENCES WANTED.



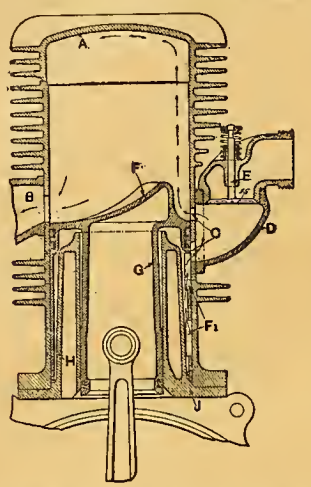
Readers desirous of obtaining the experiences of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries below should be addressed c/o The Editor.

"A.R." (Stoke Newington).—Farrar sidecars.

"M.H." (Lincoln).—6 h.p. Bat-Jap and 6 h.p. Zenith-Gradua.

"T.E.L." (Uppingham).—3½ h.p. Rudge with sidecar.

"A.K." (Bristol).—2¾ h.p. Humber with Armstrong three-speed gear.

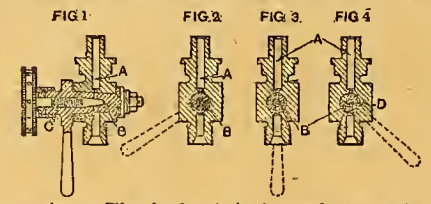


STUDYING THE MAP.

A few members of the Brockley Motor Club on the road between Pluckley and Tenterden. We are interested to observe from the photograph that all three twin-cylinder machines depicted are equipped with car tyres—a sure sign of long riding experience.

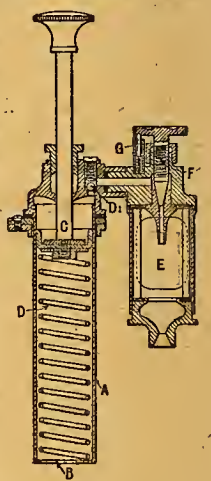
A Two-stroke Engine.

In this engine compression of the ingoing gas is not effected in the crank chamber as usual, but in a chamber specially provided for this purpose, the working cylinder A formed with an exhaust port B and inlet ports C, the latter being arranged in a chamber D provided with a non-return valve E. The piston F has inlet ports F^1, and is formed with a projection G, adapted to fit within a sleeve H, carried on a base J bolted to the crank case. This sleeve H is formed hollow, and has a clearance between its outer periphery and the cylinder walls to allow of the passage of the piston F. On the up stroke mixture is drawn through the valve E and



ports C and F^1 into the annular space beneath the piston. On the next firing stroke this mixture is compressed. Near the lower end of its travel the piston uncovers the exhaust port B, and also allows the gas beneath it to pass *viâ* the ports F^1 and C from the annular space into the working cylinder A when further compression and firing take place.—C. T. B. Sangster, No. 8,878, 1911.

A Three-way Oil Tap.



The sectional views illustrate a three-way tap to be used with the Best and Lloyd oil pump, its object being to enable a charge of oil to be pumped direct to the engine. The body A is formed to receive a plug B, provided with an adjustment nipple C, by which the orifice through the plug B is regulated. The plug has three positions, illustrated respectively in figs. 2, 3, and 4, and corresponding to the "off" position and normal position as

regards figs. 2 and 3 respectively. In fig. 4 the plug B is shown in a position in which a groove D provides an unobstructed passage from the inlet to the outlet side of the tap, enabling a charge of oil to be pumped to the engine direct, instead of dripping through the usual duct shown in fig. 3.—Best and Lloyd and R. H. Carpmael, No. 14,909, 1911.

A Best and Lloyd Oil Pump.

This is a modified construction of the Best and Lloyd automatic pump, with which is combined a sight-feed device. Sunk in the oil-tank is the pump barrel A, having a gauze-protected open end B. The plunger C is raised by the spring D, and delivers the oil past the non-return valve D^1 to a sight feed chamber E, provided with a regulating valve F, accidental movement of which is provided by a spring detent G. With this construction the plunger C is depressed against the action of the spring, for filling, which is more convenient than the reverse, and the delivery outlet of the pump being at the top affords a convenient position for the regulating valve F and sight feed tube E.—Best and Lloyd, Ltd., and R. H. Carpmael, No. 17,295, 1911.

A Severe Test.

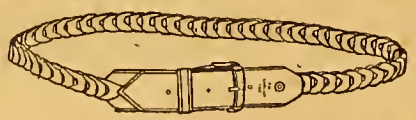
Hugh Gibson used Dunlop tyres on all wheels when he ascended Honister Pass on a Bradbury. He has since advised the makers that the rubber studs are intact, and there is not a cut in any of the covers.

Entirely Devoted to Motor Cyclists.

The Colonnade Motor Cycle Exchange, Colonnade Road, Eastbourne, have just opened new premises, which will be devoted entirely to motor cyclists.

A new garage, solely for motor cyclists, is being erected by Mr. Fred Flanders, Regent Road, Great Yarmouth. Here, not only accommodation for machines will be provided, but adjoining the premises will be rooms where riders may leave their overalls, and wash, etc.

Trade Announcements.



We are informed by Crescent Motors, Ltd., Walsall, that the firm has been reconstructed as a limited liability company, expressly for the manufacture of cyclecars. The newly constructed firm is now engaged in perfecting a new model Crescent runabout, of which particulars will be published shortly.

Harry Martin, the well-known rider and record holder, is, we understand, about to extend his business at 137, Cherry Orchard Road, East Croydon, S.E. He has taken into partnership Sydney Axford, of the Purley and District M.C.C., who is a practical motor cyclist and a keen competition rider. The firm intends to build machines to suit the exact requirements of customers. A speciality will be personal supervision of the tuning of Martin-Jap machines.

A.K. Accessories.

A new A.K. speciality is a leather chain belt, which is stretchless, and intended for wearing round the waist over a mackintosh. Users of loosely fitting mackintoshes will have noticed the tendency for the coats to be blown out, causing them to offer considerable resistance. With flat belts one notices a binding tendency, but with the A.K. leather chain belt this is done away with, as it gives under the least strain.

By the way, the A.K. throat protector has been much improved by the addition of a neck shaped to ensure accurate fit. We are using one of the new patterns, and can testify to its efficiency and comfort. The makers' address is: A.K. Manufacturing Co., 35, Swaine Street, Bradford.

Magneto Distribution.

The City Ignition Co., 274a, Goswell Road, E.C., have been appointed sole distributing agents for the British Empire for the Fein and N.F. magnetos.

Hill-climbing on a Lightweight.

J. S. Holroyd and his Motosacoche were in evidence at Bristol a few days ago, and in a letter to the makers, Mr. Haskins, the local agent, says, referring to Mr. Holroyd's performance on three of the local test hills: "I have been with him to three of our local test hills, which I never for a minute anticipated he would climb without pedalling, but the way the little machine gets over a 1 in 5 gradient is simply marvellous."

April Number of "The Arena."

The second issue of *The Arena* (the new monthly magazine for Public School and University men) has just been published. It contains many features that will appeal to those of our readers who are, or have been, in any way connected with one or other of the Public Schools or Universities. As in the case of No. 1, amateur sports take a leading place, and there are special articles on the Corinthians Football Club (supplemented by a coloured cartoon of the captain, Mr. S. H. Day). There are also very interesting articles on Oxford, Cambridge, and Rugby, besides numerous attractive illustrations in the issue. *The Arena* is published by the proprietors of *The Motor Cycle*, and the price is 1s., or 1s. 4d. by post.

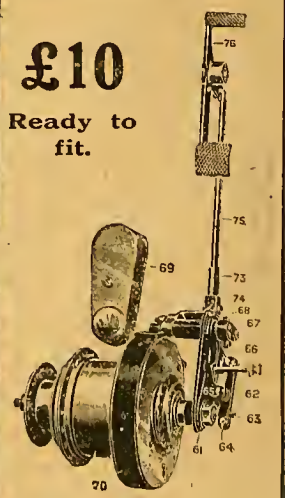
The "MILLENNIUM" TWO-SPEED HUB



L & E

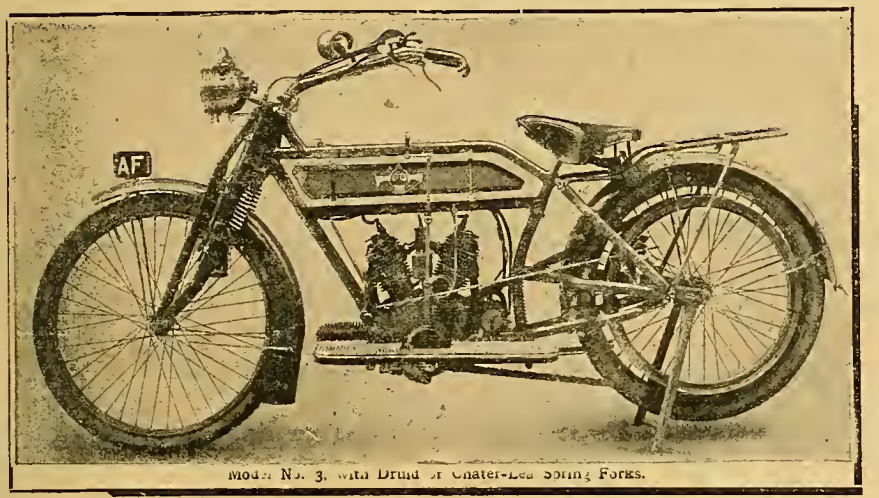
Doubles the efficiency of any machine.

The "Millennium" is without doubt the finest device of its kind, besides being, we believe, the lightest and strongest on the market. It gives High Gear, Low Gear, and Free Engine, with unimpaired efficiency on high gear. Makes the control of a machine equal to that of a motor car.

Enables you to start from the saddle at stand-still. The gear reduction is 55%. Centrally built, operated by only one foot lever. Dust and water proof. Indispensable for low power and sidecar machines.

£10
Ready to fit.

Can be fitted to almost any machine without spoiling the enamel.



Write for fully descriptive literature free.

LAKE & ELLIOT, LIMITED.

"MARTIN-JAP" MOTOR CYCLES
for SPEED and RELIABILITY.

Arrangements have now been completed whereby prompt delivery of these world-famous machines can be given. There is not sufficient space in this advertisement to detail the various records, etc., standing to the credit of these motor cycles—indeed, it is scarcely necessary, as the name of Harry Martin is world-famous. Enough if we state that over **250 Firsts** and over **200 World's Records** have been secured by the Martin-Jap.

AN IMPORTANT POINT.

Every machine is tested and personally supervised during construction by Mr. Harry Martin, **and no machine will leave the works until it has perfectly fulfilled the stringent test to which it will be subjected.** That the Martin-Jap is the most efficient machine made is no idle boast. This is proved by the consistent Record of Successes in all Open Competitions. In 1911 the Martin-Jap competed in **20 Races,** winning **17 Firsts, 2 Seconds.** Also **10 World's Records** were made, and are still standing, no other machine in the world being able to beat them despite repeated efforts.

It pays to use good oil for Motor Cycle work

and it is just as important to adopt the lubricant that is most suited for one's engine if the best results are desired.

PRICE'S MOTOR

Oils for Motor Cycles

are prepared from the finest materials that it is possible to obtain. The individual needs of different engines are carefully studied, with the result that the lubricants recommended can be relied upon to give the utmost satisfaction. The brilliant series of successes scored by Motorine and Huile de Luxe during 1911 and in previous years is sound testimony to their efficiency. The Oils used in all these events have been exactly as sold by Motor and Cycle Agents.

OFFERS WANTED.

We have close on 200 Second-hand Motor Cycles, and these, together with the New Machines that are continually coming in, and the machines that we have to take in exchange deals, are filling up the show, and it is only with difficulty that we can get either in or out, and as to the matter of showing machines, this is an utter impossibility. They are packed in rows like "herrings in a barrel." If you have not been to see the show, come over, and you will get an eye-opener and startler, more particularly if you have been to see what other people call their shows. There are more machines here than are to be found under any one roof in the world. There are Second-hand Triumphs, Humbers, Jap-Bats, N.S.U.'s, Minervas, Rexes, P. & M.'s, Singers, Moto-Reves, Motosacoches, V.S., Moto-Velos, Rudges, Rovers, and many other two-speed gear and free-engine models. Besides these, we have a dozen or fifteen Accumulator Machines, which the Sunny Jims can have at from **£3** down and balance at from **5/-** per week. The better class machines, with a few exceptions, can be had at one-third down and the balance by instalments.

If you have some **cash** left after the strike, we want you to make us an offer. Send for our list and get on the **jump** Remember that we are on the telephone, not for the good of our health, and also that we appreciate a call or wire. We must really clear some of this huge stock to make room.

In addition to the above, we have a lot of **Second-hand Sidecars** that we wish to clear at from **£3 10s. upwards,** as we must make a move on something or other, otherwise we shall have to take another shop in order to take in the daily deliveries of new stuff. We want you to **give us a hand** to make a move on this tackle.

If you have a Motor Cycle, you are **independent** of the Coal War, Railway Strikes, and other industrial upheavals. We would specially like you to come and see us. If you can do this, you will get a surprise, and we ourselves are rather surprised that more people do not avail themselves of coming to Morecambe for a week-end during the season. It is a fine place, and is a top coat warmer than in most of the inland towns, and two top coats warmer than in many towns of this country. If you blow into Morecambe for a week-end, you can be put up very reasonably, and you can have a thorough try on a machine before starting back home again. We make this proposition to the knuts, as we think it will come cheaper in the end than having railway fares to pay on machines that they want sent on approval.

Besides a host of Motor Cycles, we have a large stock of odds and ends in the way of Accessories, which, as they say in Yorkshire, **are in the gate.** If you have not had a list, it is time to get one; and if you want a new machine, we can supply you with anything that is worth having; the others you do not want.

We have in **stock** at the present moment the following new models:

P. and M.'s, Bat-Japs, chain-drive and belt-drive models; Matchless, two-speed and all models; Rudge, ordinary and free-engine models; Zeniths, all models; Clynos, two-speed; Bradburys, two-speed and ordinary models; Premiers, lightweights, two-speed, and ordinary models; Scotts, Humbers, lightweight three-speed models and 3½ h.p. two-speed models; Motosacoche, two-speed; Triumphs, ordinary and free-engine models.

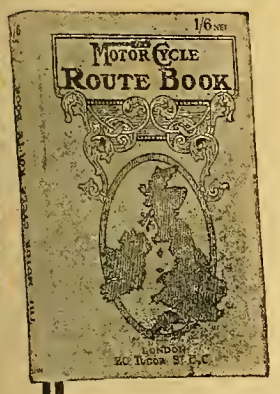
We have also coming in **this month**, A.C. Tricars, Douglas model K, Morgan Runabouts, and we are open for your kind enquiries.

If you are in the **Trade,** we can give you our best trade terms. We are catering for the wholesale, and not jealous by any means. Before buying anything, write us. Our Garage has a very poor appearance as far as looks go, but without doubt we have **the largest stock** in the World, and that is what you want to look at, not the general contour of the premises. We pay a small rent, and can give better terms than the large City Houses who have fancy rents to pay. Our stock of new machines for the season is not far short of £50,000, and we look forward to your assistance in moving this lot. So long until Eastertide.

The canaries are in full song!

—:o:—

NOTE!



We are open all Easter Holidays. Come and see us.

NEW MOTOR CYCLES IN EXCHANGE FOR USED ONES. SQUARE DEALS ALWAYS.

WAUCHOPE'S,
9, SHOE LANE, FLEET STREET, LONDON, E.C.

Wires: Opificer, Loodon. 'Phone: Holborn 5777.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication th t the oods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR BICYCLES FOR SALE.

SECTION I.

Northumberland, Cumberland, Durham, and Westmoreland.

1912 Free Engine Triumphs, in stock.—Louis Smith, The Garage, Barnard Castle.

3½h.p. Triumph, 1911, splendid condition, carefully driven; £36, no offers.—Dr. Pattullo, Spennymoor.

PREMIER, 1911, free engine, splendid condition; £40; appointment.—Wood, 23, Garden St., Carlisle.

1912 Free Engine Triumph, in stock; immediate delivery; £55.—Harburn's, motor engineers, Bishop Auckland.

1910 3½h.p. Minerva, Bosch magneto, B. and B. carburetter, perfect order; £24, offers.—Martindale, architect, Carlisle.

MOTOSACOCHE, 11h.p., magneto, lamp, generator, perfect running order; £19.—McDonald, 3, Warwick Rd., Carlisle.

2h.p. Werner, enamelled, overhauled, low, smart, good running order, cash offers; also gent's cycle, 30/.—Sampson, Brough, Westmorland.

3½h.p. Triumph, 1911 model, in perfect condition, not done much riding; £35.—Turvey and Co., The Motor House, Sunderland.

3½h.p. Triumph, competition model, won prizes in 1911; a bargain, £18.—Turvey and Co., The Motor House, Sunderland.

2¼h.p. Royal Enfield Twin Lightweight, 1910 model de luxe, in perfect running order; £23.—Turvey and Co., The Motor House, Sunderland.

NEW Machines in stock, 1912 models, for immediate delivery.—3½h.p. Triumph, £48/15; 2¾h.p. Enfield lightweight, 1912 model, 2-speed, 50 guineas; 6h.p. Enfield twin, sidecar, 80 guineas; 3½h.p. B.S.A., 1912 model, free engine, £56/10; 3½h.p. B.S.A., 1912 model, standard, £50; 3½h.p. Humber, 2-speed, 50 guineas; 3½h.p. Humber, standard, £47/10; one 1911 brand new free engine Triumph, fitted with lamp and bell, a bargain, £52.—For deliveries of anything in the motor cycle line, Turvey and Co., The Motor Cycle House, Sunderland. Tel.: No. 626.

TRIUMPHS, Humbers, B.S.A., Royal Enfield motor cycles, lightweights, 2 speeds, free engines; write, wire, or 'phone for immediate deliveries.—Turvey and Co., The Motor House, Sunderland. Tel.: No. 626.

1912 Phelon and Moores, free engine Triumphs, Douglases, Bradburys, B.S.A.'s, Enfields, in stock. —Phone: 1X2. Stout's Garage, Egremont, Cumberland.

TRIUMPH, 1910, free engine, excellent condition, only run about 1,000 miles, tyres good, lamps, spares, etc.; owner buying car; £39.—Dunn, Cleveland Av., Darlington.

1911½ Humber, 3½h.p., 2-speed, F.E., condition faultless, tyres nearly new, belt new; owner wants twin; price, with spares and speedometer, 40 guineas; seen by appointment.—Evans, St. James's Terrace, Morpeth.

BRADBURY, 3½h.p., free engine, run 1,500 miles, £37; Humber, 3½h.p., 1911, 2-speed, free engine, £33; Excelsior, 3½h.p., 1909, £26; Humber, 1911, lightweight, £25; new t rpedo, 3½h.p., £46, 1911, offers wanted; new Humbers, Matchless, Premiers, torpedoes, etc., in stock; Triumphs early.—Milburn's, Penrith.

In answering these advertisements it is desirable to mention "The Motor Cycle."

The Future of the A.C.U.

"THERE is a tide in the affairs of men which taken at the flood leads on to fortune." So is it with the A.C.U. at the present time. What we want to do in this short article is to impress upon the provincial clubs that, notwithstanding any communications they may have received from other sources, the progressives are their true friends It is the sole aim of the Motor Cyclists' Progressive Association to look after the interests of the provincial clubs by seeing that they are represented by active men whose motto is progress, and who believe in the government of motor cyclists by motor cyclists. The old policy of a section of the A.C.U., who, many think, have been too long in power, has been to quibble with the delegates of the provincial clubs at council meetings, and generally to prevent progress. The application for affiliation of the British Motor Cycle Racing Club was refused three years ago simply through the high handed and unreasonable action of the section referred to. It is perhaps a little unfortunate that the proportion of trade representatives on the progressive side is high, as it gives the provincial clubs an idea that the Union is governed by the Trade. This is not so.

The number of proxies in favour of the proposal detailed in the last issue which had for its object that no motor cycle trader be eligible to serve on the General Committee clearly shows that the local club members look upon the progressives with distrust and utterly fail to understand their policy. The proposition referred to was too sweeping, but had it been framed so that the proposal was to elect only a proportion, say not more than half, of trade representatives on the General Committee it might have been adopted. It is ridiculous to shut one's eyes to facts, and the fact in connection with the trade representation on the A.C.U. is that those traders who give their services are deeply interested in the development of the movement and their advice and experience are of very great use. Five weeks hence the club representatives on the committee will be elected, and we sincerely hope that the clubs will carefully deliberate before they act.

Lights on Sidecars.

FROM observations we have made recently, a large percentage of sidecarists are content to use their machines on the road at night with only one head light attached to the bicycle. It is almost unnecessary for us to point out that great risks of collisions are being run in this way, and especially does that remark apply to motor cyclists who use sidecars attached to the right-hand side of the motor bicycle. It is usual for car owners to regard a single light as illuminating the path of a single track machine, and, unless he were a cautious driver and allowed plenty of room for the machine to pass, a sidecarist using a single light might suddenly find himself in a very awkward predicament. It is strange that the law does not compel the use of two lights on vehicles of great width, though it is generally agreed that, in the interests of public safety, lights showing the extreme width of a vehicle should be used. We recommend all sidecarists, both in the interests of themselves and other road users, to carry two head lights, and thereby run no risk of a collision due to insufficient lighting.

ENGLISH-DUTCH TRIAL.

Closing Date for Entries. How the British Teams will be Selected.

THE Council of the Dutch Motor Cycle Club met recently, when the programme of the above international trial to be held on Bank Holiday Monday, August 5th, was considered.

A silver challenge cup called "De N. M. V. Beker" will be presented by Messrs. J. Ferwerda and A. Citroen to the victorious team, but it will be necessary for the countries to meet on more than one occasion before definite possession of the cup is gained. At the council meeting several members of the Dutch M.C.C. offered special prizes for the Dutch competitors in order to stimulate further interest in the contest, and so that the Dutch motor cyclists might put their best efforts forward to win the contest. The trial is being taken up enthusiastically in Holland. The Dutch organisation is now four years old, and has a membership of nearly 400, with a good bank balance. It is a matter of extreme pleasure to the officials of the organising body—the Dutch Motor Cycle Club—that English motor cyclists have adopted so enthusiastically their suggestion to send over a team to Holland to compete against the pick of that country. So far, we understand, the Dutch entrants mainly consist of private owners.

Choosing the English Team.

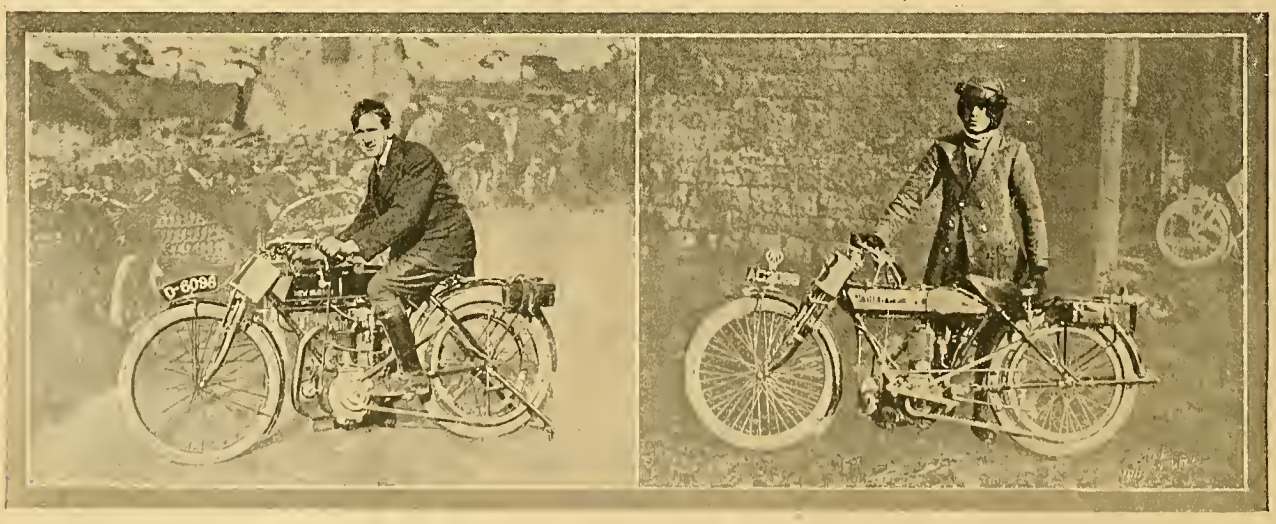
A scheme for choosing the team to represent this country has now been adopted. Entries definitely close on Saturday next, 13th inst., and immediately the time is up a list of entrants will be circulated among the secretaries of leading motor cycle clubs throughout the country, with a request that they bring the lists before the notice of their respective committees, and select the nine best private owners and nine trade riders, striking out the remainder. A count of the voting will afterwards be made, and the actual teams published in these pages at the earliest opportunity. It is desirable to choose the teams as early as possible so that those entrants not chosen may make other arrangements for the August holidays. Further, there is a considerable amount of work in the organisation, as checking cards, maps, number plates, etc., must be provided.

Those club secretaries who have taken an interest in this international trial, and would like their club committees to have a say in the matter of choosing a representative British team are invited to apply for the list of amateur and trade entrants.

The Dutch M.C.C. have wisely decided to send big round number plates as used in the T.T. to each of the English competitors, so that they may be fitted at home.

British motor cyclists who desire to enter have still another chance. Amateurs should have at least three non-stop runs in observed trials to their credit. The fees are as follows: Private owners, 5s.; trade riders, £1. Entries should be forwarded to the editor of *The Motor Cycle*. One or two private owners who have entered have not forwarded the 5s. fee.

Amendments to the Rules.



One or two alterations have been made in the conditions. In the Lightweight Class it has been decided to increase the capacity limit to 350 c.c., which is the 1912 Junior T.T. limit as adopted by the A.C.U.

The Dutch M.C.C. request that the visit to Holland be extended to the Wednesday evening. They point out that a boat leaving the Hook of Holland on Wednesday evening reaches Harwich next day at 6 a.m. No doubt some of the members of the party will avail themselves of this invitation.

Mr. Seymour Smith, one of the amateur entrants, considers it advisable for the selected teams to go over the course at least once before the competition, which would necessitate leaving Harwich on the Friday preceding the trial. These matters, however, will be suitably arranged at a later date.

Mr. Horatio Wallis, if chosen, has now decided to ride a two-speed Bradbury.

We are requested to point out that in Holland road users keep to the right and overtake on the left, the reverse of the usual order of things.

TWO OF THE CLASS WINNERS AT THE DERBY AND DISTRICT M.C.C. OPEN HILL CLIMB.

1. H. Borwick (2¾ h.p. New Hudson) first of the Junior T.T. riders. 2. H. C. Newman (3½ h.p. Ivy-Precision) who gained first place in Class III.

Special Fittings on Brooklands Racers.

THE first race meetings of the season generally bring forward a number of new ideas, but this year there have been for some reason comparatively few. The accompanying sketches, however, depict some of the more noticeable novelties on competing machines, and from these it will be seen that in the majority of cases more attention has been paid

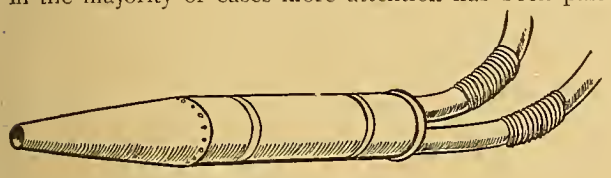


Fig. 1.

to silencers than other details. Of these several new types have been seen on the track. Godfrey's 3½ h.p. and Moorhouse's 7 h.p. Indian were fitted with silencers as shown in fig. 1. Generally speaking, they appeared to be effective, and were certainly neat looking. The wrapping of asbestos cord round the exhaust pipes is for the purpose of protecting the

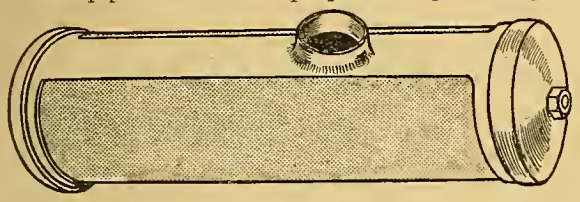

Fig 2.

rider's shin, as this part of the pipes is immediately over the foot-rest.

Guiver's and R. Cook's Rudges had large diameter extended pipes. Else's Rudge was fitted with an ordinary exhaust box perforated almost all over with small holes, the bottom of the silencer being left plain so that the gases would not tend to raise dust. There

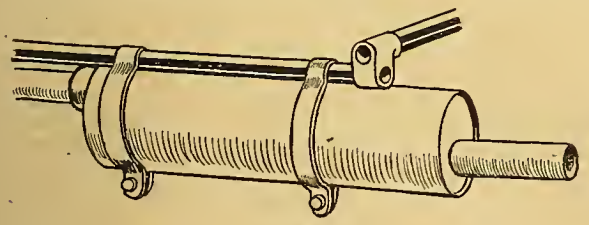

Fig. 3.

is good reason to suppose that if the holes were placed only at the back of the exhaust box the result would be better. If they face forward at all the pressure of the air which the machine meets must set up a back pressure in the silencer by tending to prevent the exhaust gases finding their way out, and that such is the case seemed to be proved by the marks which the streams of gas had left on the outside of the box, showing that they were very sharply deflected indeed.

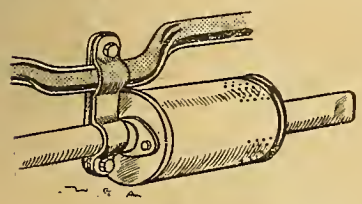

Fig. 4.

Yet another Rudge silencer is that shown in fig. 2. This was much wider than usual, and consisted of an outer shell supporting practically a tube of closely perforated brass. It will be realised, of course, that the smaller the holes the greater is the difficulty which the gases experience in passing through them, irrespective of their number, and this in itself is probably sufficient to induce a good deal of back pressure.

Harry Martin had got two very large silencers on the successful Morgan runabout, as shown in fig. 3, and also a large one on his Martin-Jap motor cycle as indicated in fig. 4. In both of these a large expansion chamber was provided, and that on the Morgan runabout certainly appeared to be efficient, as the machine showed a remarkable turn of speed, and was, perhaps, the quietest of all the cyclecars.

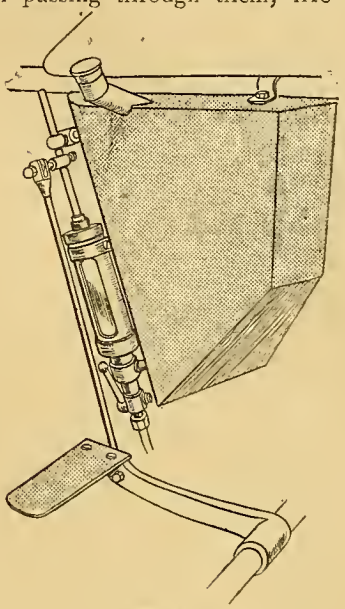

Fig. 5.

Sam Wright had fitted to his winning 2¾ h.p. twin Humber a neatly arranged foot operated oil pump, a sketch of which is given in fig. 5.

It will be noticed that the oil is contained in a wedge-fronted auxiliary tank placed below the back end of the petrol tank. By this means the redoubtable Sam was able to go through the whole hundred miles without having to fill up.

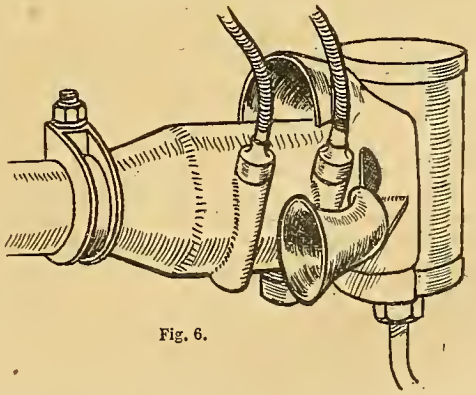

Fig. 6.

On W. Smith's Rudge and one or two other competing machines of the same make a special type of Senspray carburetter was used, a rough sketch of which is given in fig. 6. It will be seen that the spraying chamber is provided with two air scoops, the larger one of which applies to the main air intake whilst the smaller one directs a small stream of air immediately over the jet.

Occasional Comments by "Ixion"

"A" Shaped Number-plates.

I see that "A" shaped number-plates are growing in popularity. They are, strictly speaking, illegal, as the law demands an upright plate; and in practice they have one serious defect, in that they greatly enlarge the shadow cast by the lamp at night. If the lamp be mounted high, their broad shadows fall close to the front wheel, and they merely prevent the rider from sighting stones which may gash his tyres or set his machine on the wobble; but when the lamp is carried low the shadow they throw keeps bucketing ahead of the driver, and considerably interferes with the comfort of night work. I am a great believer in the single thin vertical plate carried low, with the lamp mounted high.

Adjustable Foot Control.

The increased popularity of free engine clutches has added to the number of control pedals fitted to the average machine, and very frequently a maker has a single standard fixed mounting for such controls.

As most men fail to exceed 5ft. 9in. in height, these control pedals are usually mounted amidships on the standard machine, and when a tall rider purchases one of these machines, he finds it practically unrideable until he has altered the controls. I bought two new machines last year, and neither of them was really safe for my riding as delivered. On one I had to make a new pedal, brake rod, and mounting spindle, for otherwise I rode with my feet miles away from the vital pedal, and had hastily to feel for it in emergencies.

The other—a foreigner—was even worse, for the brake, clutch, and cut-out pedals were all alike inaccessible to me. Surely every maker must realise that his customers will range in height from 5ft. 6in. to over 6ft., and even if the tall customers are in a minority, he should none the less cater for them. It is easily done in several ways. He may either stock two separate sets of control fittings, one for the rear footrests (for short and average riders), and one for the front rests (for lanky owners); or he may adopt the plan favoured by one or two leading makers by mounting his rests on short depending arms adjustable by toothed ring brackets; if the arm be 4in. long, this mounting gives a very considerable range of adjustment, and will meet the difficulty.

The Scottish Six Days Trials.

I hear that the Scottish Six Day Trials are provisionally fixed for July 15th to 20th, and that a number of lady riders are eager to compete, provided a married lady can be procured to accompany the event and act as chaperone. This proviso shows how *fin de siècle* we are becoming. Perhaps in the near future all the leading clubs will provide official chaperones. If any married motor cyclist intends to compete and take his wife with him in a sidecar, he might communicate with me.

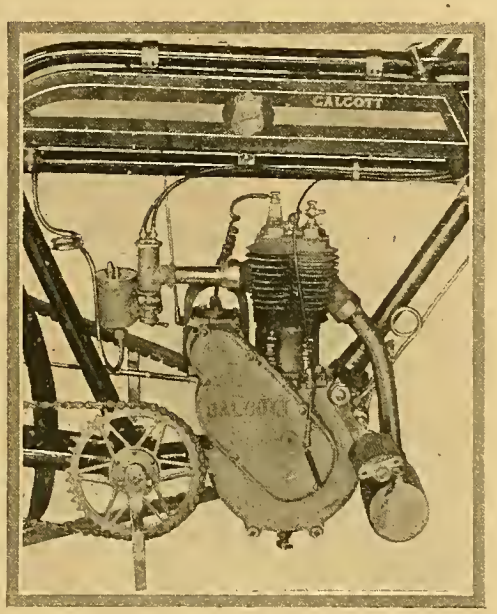
The route is to be considerably stiffer than last year, and intending competitors may rely on the maximum of gorgeous scenery and a surfeit of sporting hills. It is not advisable to compete in these trials without a variable gear.

Wanted, a New Wheel Bearing Lock.

It is a constant puzzle to me that no motor cycle engineer has yet produced a simple wheel bearing adjuster for ordinary cone adjusting hubs which is not affected by removing the wheel from the forks. Barring a few exceptions, the trade aims at making both front and rear wheels rapidly detachable, in order to facilitate tyre repairs.

When we get a bad puncture, we mostly prefer to take out the wheel and repair at leisure, seated on a bank where the wild thyme grows, rather than to squat in the dirty road, with one leg on each side of the machine, and dodge the belt, mudguard, carrier stays, and so on. But the charm of this newer process is greatly reduced by the fact that the cone adjustment of the wheel bearings almost invariably shifts when the axle nuts are loosened; in many cases we actually ask for trouble, because one nut is tighter on the spindle than the other, and it is occasionally quite an awkward and tedious job to restore the correct bearing adjustment. I always order specially tight-fitting cones, but even thus I usually find that one nut binds and the other is too loose.

There is a distinct opening on many makes for a new cone lock which shall be independent of the axle nuts. One or two firms fit disc adjusting bearings, notably Triumph and Chater-Lea.



Harry Reed (Det) establishing an early lead in the Derby and District M.C.C. open hill-climb at Oakamoor.

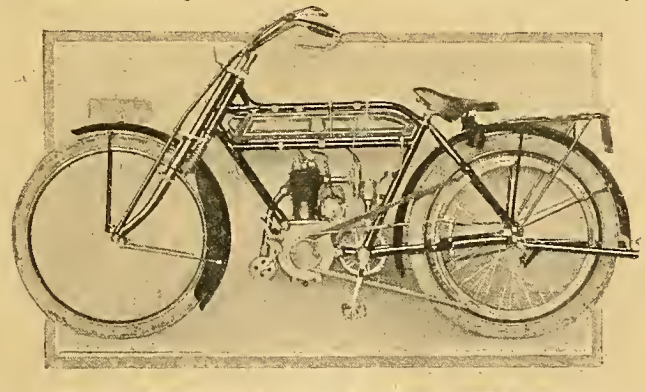
A TRIAL OF

The Lightweight Calcott.

A FEW days ago we received an invitation from Calcott Bros., Ltd., Coventry, to have a short trial run on one of their lightweights. The engine of this machine has been increased in bore since it was described in our Show report of November 23rd, 1911. The cylinder is now 70 mm. bore × 76 mm. stroke, and the magneto firing point, which was previously fixed, is now adjustable, the lever for operating it being close up to the rider on the left side of the tank.

Reference to the illustration will show that the frame follows standard lines, but the steering head is fairly long and supported by a tubular stay from the top tube. The rear frame is dropped, affording a comfortable low riding position. The valve lifter is on the left bar and the front rim brake lever on the right. Both levers are of the inverted type. This machine has no clutch, variable gear, or free engine device, and is started by pedalling or running alongside, the idea being to produce a machine with as little complication as possible to enable it to be sold at a remarkably low figure. The machine we took over for a trial run of about fifty or sixty miles was quite new, and we were at once struck by its quietness when starting it up on the stand.

The power unit of the latest pattern 2½ h.p. Calcott.

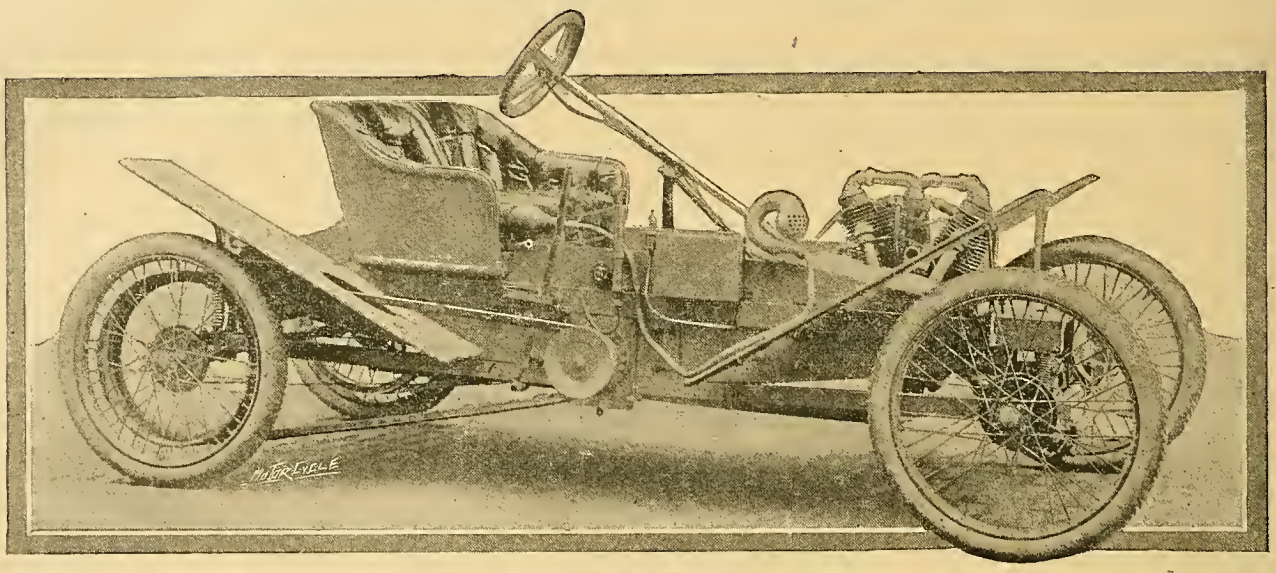


Up Warmington with a Hot Engine.

Accompanied by one of the members of the firm on a similar machine, we left Coventry on a fine afternoon, our destination being Warmington Hill, which is one of the ascents on the Edge Hill range, and a hill which we have always found to be a fairly good trial for any single-cylinder motor cycle of the lightweight class.

The writer's weight being nearly thirteen stones, he always considers it a good performance if a new lightweight machine will tackle Warmington Hill and reach the top with a hot engine unaided. With a view to proving the speed capabilities of the little machine it was not spared on the somewhat undulating road *via* Warwick and Gaydon Inn to the foot of the hill, which was reached in about one hour riding time from Coventry, the distance being about twenty-four miles. At the foot of the hill the engine was indulged in a little extra lubrication, and the grade as far as the church was taken at an excellent speed. Just opposite the church the gradient is about 1 in 7, and at this point two or three turns of the pedals were required to enable the engine speed to be maintained sufficiently to carry it over the stiffest portion of the hill. Beyond the church the grade eases slightly, and the engine immediately picked up and took the rest without a falter. In all, we made three ascents of the hill, but found that with the standard gear of 5¾ to 1 exactly the same amount of assistance was required at exactly the same point.

Comfortable Touring Mount.



At the conclusion of our trial it was beginning to get late, so we made our way home, and returned the machine to the makers with the opinion that in their new lightweight model they have a comfortable, easy running, easy starting machine which is capable of taking an average-weight rider almost anywhere on main roads. As the machine is provided with an easily adjustable pulley, it is possible to reduce the gear considerably, when, of course, it would climb very much steeper hills than the one on which we tried it; in fact, we are told that with a gear in the neighbourhood of 7 to 1 a similar machine has taken about thirty stones over the well-known Coventry test hill at Stoneleigh.

The neat appearance of the Calcott lightweight is apparent from this illustration.

Incidentally we may mention that the whole of the power unit with the exception of the carburetter and magneto is constructed by Messrs. Calcott Bros. in their own works. Certainly we have never ridden a better finished or better running machine which is sold at such a moderate figure as the 2½ h.p. lightweight Calcott, and more will be heard of it in the near future. The magneto is a Bosch and the carburetter a Brown and Barlow.

ANOTHER NEW CYCLECAR.

A racy looking 9 h.p. two-speed cyclecar owned by H. J. Harding.

ON a recent occasion we had a visit from Mr. H. J. Harding, who arrived on a 9 h.p. cyclecar, which he had built for himself in his Paris workshop and had driven by road from the French metropolis to Boulogne. It is an exceedingly interesting little vehicle. The motive power is a 9 h.p. J.A.P. engine (85 × 95 mm.) with automatic valves; the cylinders project above the floorboards, thus being well exposed to the air. The body parts are held together by means of rods, which run in pairs from one side to the other, and are held in tension by nuts abutting on the sides of Hans Renold chain links.

The transmission from engine to counter-shaft is by Hans Renold chain. This counter-shaft is provided with a spring clutch arrangement, which acts as a differential. The counter-shaft, consisting of a central portion carrying the chain wheel and two outer portions on which are fixed the belt pulleys, is connected by spigots. The three portions are also joined by two coil springs, which are tightly wrapped round the axle and anchored at one end. When the engine is driving, the springs coil tightly round the counter-shafts and drive solid. If a corner be turned the inner half of the shaft remains practically stationary, through the spring sliding over the central shaft, while the outer half drives practically solid. The broad principle of this method is similar to the coil spring clutch used on the Mercédès car. The body, as will be seen from the photograph, is clamped in the centre to two longitudinal ash splines, 1½in. square; these form the major part of the springing of the vehicle, but interposed between their ends and the body are spiral springs, while two straps at each end are provided to restrict the limit of the rebound.

Old Type Gear Revived.

The gear is the well-known Bozier epicyclic two-speed, which was used on quads and tricycles in the early days of the movement. It is controlled by one pedal, which, when pressed right down, engages the low gear; in the midway position it is in neutral, and if allowed to rise to its fullest extent the top speed is in engagement. A lever is also provided to hold the top gear temporarily out of engagement, if required, as is the case when very thick traffic has to be negotiated. The final drive to the rear wheels is by belts. Internal expanding brakes are provided to all four wheels. The two steering wheels are coupled together by the usual tie rod, and their movement is effected by means of a drum, round which wires are wound. The petrol tank is at the rear of the back seats, and the fuel is fed by pressure to the carburetter.

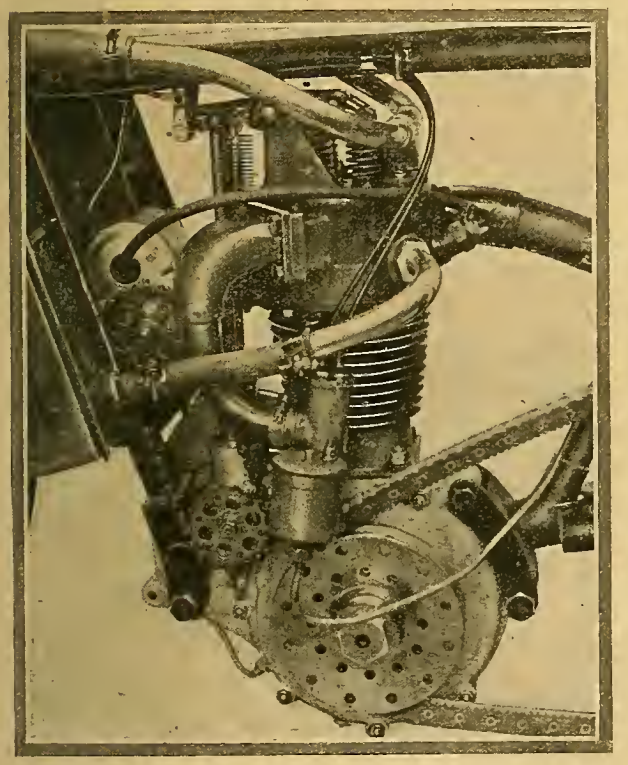
We tried this cyclecar in the London traffic, and found it to run extremely well. It is easily controllable, develops ample power, and made a good showing on Netherhall Gardens; but owing to the switch being accidentally cut off, or to the petrol not feeding properly, it came to a standstill on the 1 in 7½ grade, and although the passenger and driver remained seated it made a most successful restart without the slightest hesitation.

The vehicle is not actually on the market, but represents a type which Mr. Harding would like to see taken up. His address is 211, Northumberland Park, Tottenham, N., and he was formerly a reserve rider in the first International Cup Race, and was on that occasion mounted on a 4 h.p. single-cylinder Lagonda.

A.C.U. OFFICIAL HANDBOOK.

The 1912 edition of the Auto Cycle Union official handbook is to hand. It contains a complete list of motor cycle clubs affiliated to the A.C.U., also a list of officially-appointed hotels and repairers, with prices of hotel accommodation clearly set forth. The open competition rules of the A.C.U. are for the first time included in the handbook, and a perusal of this chapter will be of interest to club secretaries who are running open events this year. There are interesting chapters on hill-climbing and petrol consumption formulæ, legal requirements for motor cyclists, a *resumé* of the Six Days' Trials, a history of the International Tourist Trophy Races, and a list of British motor cycle records existing on January 1st, 1912. Continental customs facilities, and a list of ferries in England and Wales with their charges, and particulars as to International travelling passes are also included. The handbook is being issued to all members and hon. secretaries of clubs affiliated to the A.C.U. Those who require further information concerning the handbook, or other particulars regarding affiliation and membership, should apply to the Secretary, 89, Pall Mall, S.W.

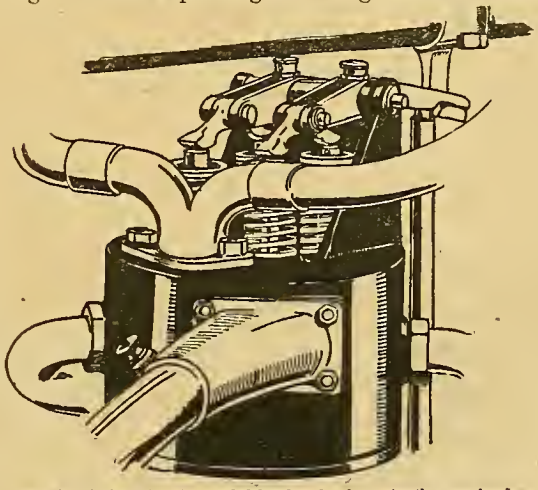
LOST AND FOUND.



We receive many letters regarding accessories, etc., both "Lost and Found," which we are unable to find space for. As these particular matters are of interest to two persons only, viz., the finder and the loser, we keep a list of such articles, and, should we receive a letter from the finder which corresponds to the article lost, the two persons are put into communication.

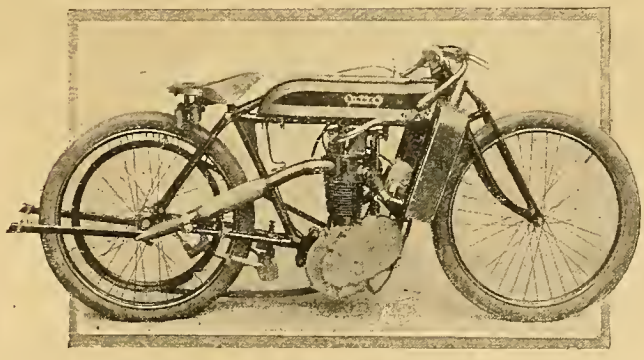
A New Racing Engine.

THE Singer Co. have evolved a very novel engine for racing purposes with which they expect to do great things at Brooklands. The power unit was designed by Mr. Louis Coatalen, of the Sunbeam Co. The bore and stroke remain 85 × 88 mm. respectively, so that the machine is eligible



The new Singer racing engine with four overhead valves and water-cooled head.

to compete in the 500 c.c. class. The head is water-cooled, and in it are placed four large valves, two being for the exhaust gases and two for the inlet. The ports are cast in the head. A roller chain-driven camshaft in front of the engine operates stout push rods, opening the valves by a neat overhead rocker system, which can be clearly seen in the accompanying illustrations. The exhaust valves can be depressed by the usual hand lever through a neat cam gear bolted on to the lower top tube. Two small water radiators are carried pannier fashion, attached to the down tube, circulation being carried out on the thermo-syphon system. The magneto (an enclosed Bosch) is driven by a separate exposed chain off the end of the camshaft. The water-cooled head is bolted down to an air-cooled cylinder with tapering flanges.



Other Departures from Standard.

Besides the engine there are several unusual points on the machine, noticeably the webbed lug to take the rear ends of the top tubes, also the neat method of controlling the oil pump by a pedal mounted on the foot-rest. All that is necessary to inject a charge of oil is to depress by the heel a pedal fitted on the right footrest. This raises the pump handle by means of a Bowden wire, the plunger being afterwards depressed by means of an internal spring. It is quite reliable, having received a prolonged testing at Brooklands.

Showing design of water-cooled head and valve actuating mechanism.

The tank comes to the level of the top of the frame on one side, so as to give a greater capacity. The silencer also is unusual, but as its construction will be clear from the photograph a description is unnecessary. It is hoped that the machine will accomplish the speed of eighty to ninety miles per hour, and its performances will be watched with interest by followers of the racing game.

The complete machine, in connection with which speeds of 80 m.p.h. are talked of.

UP TOWTOP ON A SIDECAR.

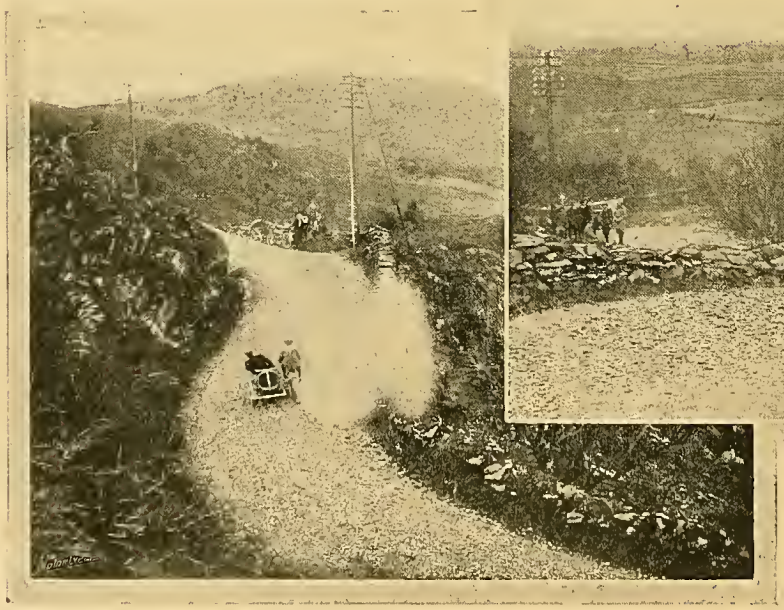
A Severe Climb on the Fringe of Lakeland.

THREE weeks ago, when nought but the storm-song of winter echoed 'midst Lakeland heights, the stern solitudes of Honister Pass were disturbed. The motor cycle men from the Midlands came, saw, and conquered. The worst hill in Cumberland, perchance in Britain, was robbed of its reputation for inaccessibility. But for some the joys of victory were tempered by ominous hints from the Westmorland enthusiasts. "It's nought to Towtop!" came the challenge in broad North-country dialect.

Thus, for the third time in the present month, the insatiables of the Cumberland and Westmorland Motor Cycling Clubs foregathered on a recent Saturday as official observers of the feats of Midland experts. Mr. Frank Smith on his Clyno was to attempt the first ascent of Towtop.

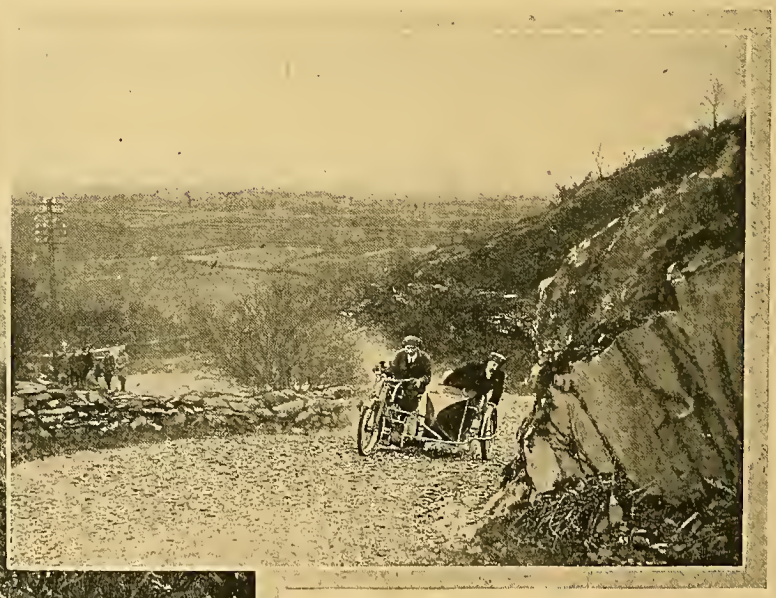
At the outset, it may be said that the hill was as hard to find as to climb. Even in Kendal, the gathering place of the motor clans, its whereabouts were most vaguely described—in fact, practically unknown—and available maps gave no information.

How to Locate Towtop.



Thus a description of how to find Towtop may be useful. (Incidentally, for motorists coming to Bowness-on-Windermere, there is no finer or more direct approach to the heart of the Lake Country than by the foot of Towtop, and thence along the Witherslack valley to Winster.) The springtime beauties of this region are delightful. Aloft, shattered limestone escarpments gleam in the sunshine; below, the hazel-bedecked pastures are carpeted with daffodils, through which the slow-flowing Winster winds its way seawards.

But, best of all, as some may think, the road surface is excellent, even better at present than the main highway, though narrow in places, and at some of the corners the "speed man" will have little chance of admiring the views. Whether travelling north or south on the Kendal-Preston Road, *via* Milnthorpe, the traveller should turn off at Levens and take the Grange Road for some four and a half miles as far as the Derby Arms. There the main road is neglected and a sharp turn to the right taken. This is the way up to Witherslack Hall, the residence of Lord Derby; but those who attach more importance to Towtop must turn suddenly to the left in the little village which is entered a few hundred yards after leaving the Derby Arms. Two-thirds of a mile further, another sharp and unlikely turn to the left is taken, and soon a rocky range looms in front. Nearer approach shows a road of curious and ancient construction winding airily up into the heights. This is Towtop. In the good old coaching days it was the route between Kendal and Ulverston, and in an adjacent homestead relays of four extra horses were kept for the ascent. The good road to Winster and Windermere cuts at right angles across the bottom of Towtop.



Such were our discoveries last Saturday week. Soon the main section of the party arrived, but almost all the afternoon lost members kept adding to the large gathering, which comprised a sprinkling of ladies. The Clyno was now left below, and its driver with his passenger, Mr. Paskell, inspected the hill. There had been no "trials," and neither of them had previously seen Towtop.

The Gradient of the Hill.

The new hill rose at a surprisingly steep angle for almost a mile, and thence continued in half a mile of easier grade to the summit. Main interest was centred in the eight bad turns in the first mile, and on each of these the gradient was given as 1 in 4½, but in negotiating them sharp "steps" of 1 in 3 had to be rushed. At each of these the surface was loose, and like unto a mountain side. The curious S turn about two-thirds of the way up was voted the *pièce de résistance*. There the sensation-seeking sightseers took their stand.

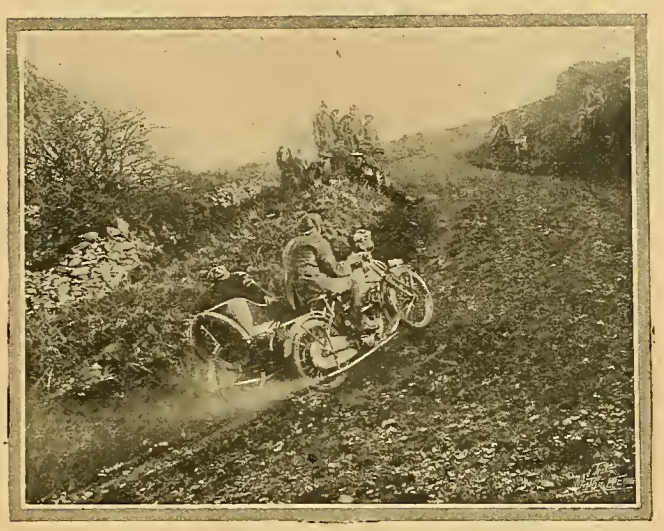
Rounding the upper S bend on Towtop. The summit is seen in the distance.

At the middle bend, about half way up the hill.

The foot of the hill was now visible some hundreds of feet below. The roar of the twin came up to us; a film of smoke hid the unnecessary signallers. "He's away!" was the cry. The first turn was taken slowly, a necessary precaution as some proved later. Up came the sturdy machine straining, swinging, bumping, and jumping over the mountainous slope, Smith and his passenger masters of craft in their feats of balance and control. Their strained faces seemed to leap suddenly upwards out of the depths as they appeared over the profile of the gradient at the third turn. The speed flung them across the stony surface with a surprising skid, stirring to spectators, Clyno and climbers alike. The front wheel swung almost at right angles to the direction of progress. But the balance

Up Towtop on a Sidecar.—

was just regained for the next turn, which was encountered instantly.



Here was the worst surface. The driving wheel spun wildly, bits of Towtop were flung all around painfully, as at least one of the spectators could prove. Progress was checked, but not stopped. Gradually the driving wheel found more solid ground, and a shout of relief rent the air as we saw the Clyno gather speed; with a roar of satisfaction, as it were, the machine dashed up the straight to the upper turns and out of sight overhead, never faltering to the summit.

Ascents on Motor Bicycles.

Numerous motor bicycles attempted the climb; three were successful, a Zenith, an Indian, and a Rudge, the latters ridden by the hon. secretary of the Cumberland Club, Mr. W. B. Little. Some failed at the first bend through taking it at high speed. After an unnerving skid one of them hit the dust, and his tongue also; thus, fortunately, little could be said. Then, at the finish, Mr. Frank Smith made two other ascents, the first of these accompanied by a passenger who modestly acknowledged to a weight of nearly fifteen stones. During the descent a Lakeland rain-storm clouded the valley; damp and rain-sodden we whirled back to civilisation through misty twilight. But thoughts lingered on the afternoon's sunny prospect from Towtop over fifty miles of Lakeland beauties, with the pale blue Pennines hanging dreamily on the horizon. Some of us will return to Towtop.

Finally, why not include the new hill in one of the reliability trials? Towtop is as much a main road as the better known, but less trying, Scotch test-hills, and from its crest cars or cycles could continue the splendid high road to Bowness-on-Windermere and Ambleside.

GEORGE D. ABRAHAM.

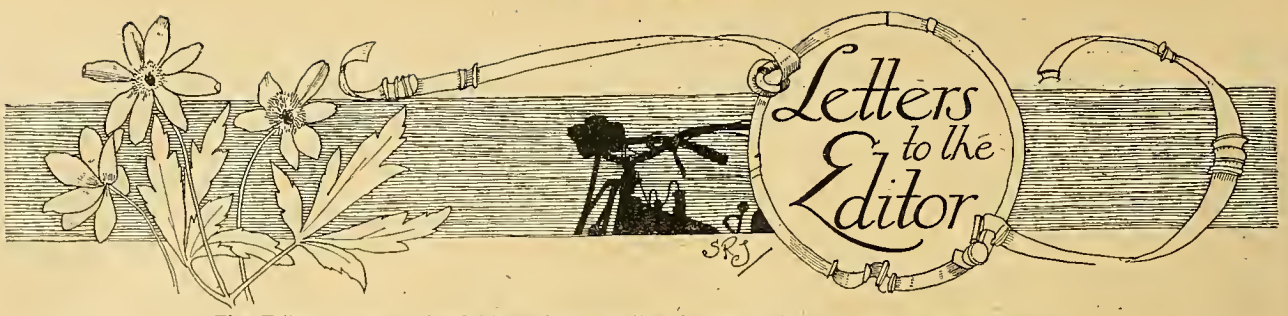
Another view of the S bend. The gradient at this point is said to be 1 in 3.

THE LATE AUBREY MANNING LOMAX.

To the many readers of *The Motor Cycle* to whom Aubrey Manning Lomax of the B.S.A. Co. was known, the news of his sad death will come as a very great shock. It is surmised that a tyre burst, causing him to be violently thrown while riding near Castle Bromwich. He was picked up unconscious in the road by passing motorists, who at once conveyed him to the Birmingham Hospital, where he died early the next morning from a fractured skull, the verdict at the inquest being accidental death. It was intended that he should be buried at Polesworth, the home of his *fiancée*, Miss Davies, to whom our deepest sympathy extends, but at the last moment, in compliance with the request of his parents, his body was embalmed, and, after a very beautiful choral service, conducted by the Rev. Canon Trotter, was despatched to his home in New South Wales.

Mr. Lomax left Australia about five years ago, and studied engineering first at Harvard in the U.S.A., and afterwards at the Birmingham University. About twelve months ago he was engaged by the B.S.A. firm, to whom the family wish to express especial thanks for all they have done. His relatives were also much touched by the kind thought of the Birmingham Motor Cycle Club in sending a beautiful wreath, and in having themselves represented at the service by Messrs. Duke, Fowler, and Pugh.

THE NEW A.C.U. SECRETARY.



Mr. T. W. Loughborough, A.M.I.A.E., who was last week appointed secretary of the Auto Cycle Union.

The A.C.U. has been fortunate enough to secure as secretary the services of Mr. T. W. Loughborough, A.M.I.A.E. Mr. Loughborough is best known to our readers as honorary secretary of the B.M.C.R.C. The first year of its institution Mr. A. G. Reynolds undertook the work, and his quick perception soon resulted in the singling out of Mr. Loughborough from among the members as his possible successor. Since Mr. Loughborough took over the organisation of the B.M.C.R.C. that body has gone ahead by leaps and bounds, and now is one of the most enterprising clubs in the country; all the work in connection with the B.M.C.R.C. has been entirely honorary and accomplished in his spare time. His original ideas, which are embodied in the races, the excellent organisation of events, and the general success of the B.M.C.R.C., indicate that he should make a great success of the A.C.U., to which he will, of course, devote himself exclusively.

Mr. Loughborough is an old Marlborough boy, and it is interesting to note that he served with the regular troops in the South African War, and was promoted to the rank of Captain in the reserve of officers for services rendered. He is also an engineer of considerable experience, and has worked with Maudslay, Sons and Field, Ltd., Thornycroft and Co., Ltd., and Vickers, Sons and Maxim, Ltd.

We offer Mr. Loughborough our sincerest congratulations on his appointment and our very best wishes for his success in the new work he is undertaking. He hopes to be able to start on his duties early next month.

Mr. H. P. Beasley, whose work for the A.C.U. for the last seven years has been fully appreciated by all with whom he has been brought into contact, has been promoted to the post of assistant secretary.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Calculating Engine Revolutions.

Sir,—Here is a formula of mine that I have always been meaning to send you for calculating the engine revs. when the speed and gear ratio are known; it is correct to within $\frac{1}{165}$th, and is taking for granted that a 26in. wheel is used.

Revs. per min. = 13 × gear No. × m.p.h.

Thus the revs. of a T.T.T., with a gear of 4-1, at 65 m.p.h., are as follows:

13 (constant × 4 (gear No.) × 65 (m.p.h) = 3,380.

If a 28in. wheel be used, put down 12 as a constant instead of 13; the error will only be slight.

LAURENCE STRAKER.

A Belt Tightening Tip.

Sir,—A few days ago I was motor cycling out to the golf course and found my leather belt slipping for want of tightening. I arrived all right, but on my return I couldn't get engine to start, and it was just about ten minutes before lighting up time, and I was at my wits end to know what to do to make it start without shortening the belt. An idea came into my head. I picked up a small piece of newspaper, soaked it in water, and placed it in groove of belt rim, started engine, and came home flying. I shall never be afraid of having a loose belt again, as I believe I could get home from any distance by this method. I have never heard of the tip, and if you think it worth while publishing, it would be a great boon to motor cyclists who use belt drive.

T. A. ROE, L.D.S.P.C., &c.

Peroxide of Hydrogen in Acetylene Generators.

Sir,—I make use of peroxide of hydrogen almost daily in my business as an antiseptic and deodoriser, so that the articles and correspondence in your paper have greatly interested me.

It is a fact that is well known to users of peroxide of hydrogen that it will not keep well unless preserved with a small quantity of acetanilide. The only chemists as far as I know who preserve it in this way are Messrs. Park, Davis, and Co., who manufacture it for the use of the medical profession. This solution answers perfectly for the purpose of increasing the light, and will keep well in the generator for weeks. This has been proved by experiment absolutely.

Of course, I have no interest in Messrs. Park, Davis, and Co. except as a satisfied user of their products.

E. W. MORRIS, M.R.C.V.S.

Sir,—A lengthy dissertation on chemical matters would hardly be interesting to your readers, nor, judging from the tone of a correspondent's letter, would it benefit him much. My article only mentioned the oxidation of hydrogen sulphide to sulphuric acid as a minor point, but I can assure him that—

(1) Although "oxidisation" of hydrogen sulphide by hydrogen peroxide may be a questionable matter, yet *oxidation* does take place.

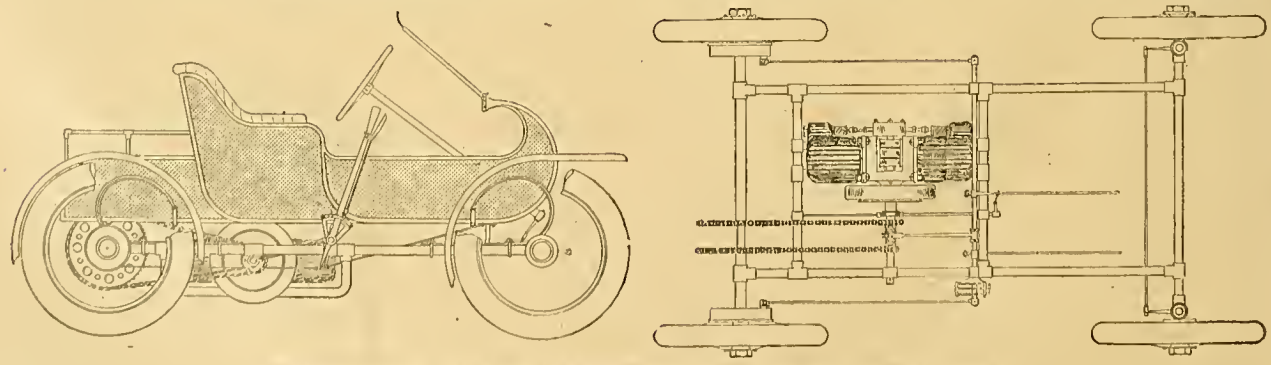
(2) That free sulphuric acid cannot exist in contact with the lime is correct, but it is equally certain that the carbide container, which was referred to in my article, shows distinct corrosion after using hydrogen peroxide.

(3) I certainly did not mention any catalytic action of the peroxide, nor do I assert that peacocks lay eggs and for the same reason.

FRANK HARVEY.

Design of Cyclecars.

Sir,—Having seen several descriptions of cyclecars in your excellent paper, I have the pleasure of enclosing some plans of mine. I have specially designed this with an 8 h.p. Douglas engine. The chassis is brazed direct on the front and back axles. The engine, being well below the body, receives a full cooling draught, and the body is entirely insulated from the chassis by four C springs, and consequently does not receive any of the engine vibration or road shocks.

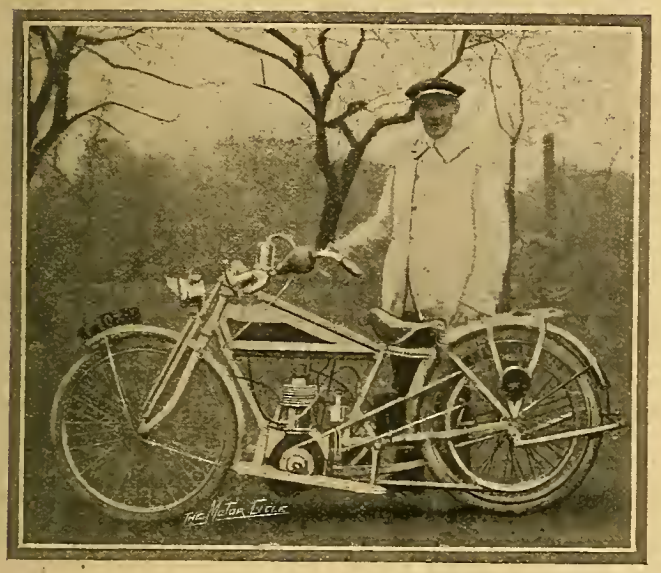


The steering is by wheel; the seating is for two, side by side, and very low. There is plenty of room for spares in the box at the back, and luggage on top.

The transmission is very simple, and has very few working parts. The drive is direct on high and low gears.

The engine transmits its power through a clutch to a shaft, on which are mounted two dog-clutches, engaging respectively two different sized chain wheels. The low gear chain does not revolve when high gear is in operation, so reducing wear of chain to a minimum. On the back axle two chain wheels are also fitted: the one for the low gear is mounted on a free wheel. No differential is required, only one wheel being driven.

By a simple arrangement a single gate lever is used for both brakes and gears. The clutch is foot operated, and the foot brake acts on the two rear wheels (the same as the hand brake), but the hand brake lever stops in its position when the pedal is operated.



CH. OLLERS.

Interesting design of cyclecar with an 8 h.p. horizontal engine. (See letter signed Ch. Ollers)

A Converted High Frame.

Sir,—Seeing in your columns from time to time examples of cut down frames, I enclose an amateur photograph of my machine, which was a high framed Chater-Lea. My brother and I did all the necessary alterations, which included new tank, stand, carrier, footboards, long exhaust pipe, etc., left crank swings and right crank has a small sprocket attached in place of ordinary chain wheel, and by tipping up the right footboard with the toe the machine can be started on the stand either by hand or foot. The machine is now extremely comfortable.

The converted machine referred to in accompanying letter.

VINCENT N. STANLEY.

Consumption Comparisons.

Sir,—As stated in your leading article of March 14th, the comparison of performances on the ton-miles per gallon basis gives an apparent advantage to the car. Those who have followed the progress of the motor cycle will wonder whether the efficiency of the motor cycle is really as bad as this comparison would lead one to suppose, or whether this basis of comparison is fair to the motor cycle.

Is it not probable that the power required to propel the cycle or car is not directly proportional to the weight, but to some power of the weight?

Comparison of performances of a number of cars of similar form, but of varying sizes, at the same speed, say, 15 m.p.h., would decide whether petrol consumption is proportional to weight or to some power of the weight.

The two-thirds power of the weight is suggested as a probable approximation. This would give as a basis of comparison—

(Weight in tons) $\frac{2}{3}$ × miles per gall.

Using the figures in your leading article, viz., motor cycle and rider = 3 cwts. and petrol consumption 100 miles per gallon, as compared with car of 30 cwts. with petrol consumption of 20 miles per gallon, we get:

Motor cycle—$(\frac{3}{20})^{\frac{2}{3}} \times 100 = 28.2$ ton-miles per gall.

Car—$(\frac{30}{20})^{\frac{2}{3}} \times 20 = 26.2$ ton-miles per gall.

J.W.

Sir,—In your issue of March 28th, I consider that C.S.P. makes several unintentional mis-statements *re* the thermal efficiency of petrol engines. He says that in the case of a water-cooled engine, part of the heat, given to the water during the initial part of the explosion stroke, is given back again during the latter part of the same stroke. Now, how can this be? I do not know the temperature of the burning gases, but I do know that it must always be considerably higher than that of the cooling water, which can in no case be much above 212° F.

If any heat is ever given back to the expanding gases, would it not rather be in the case of the air-cooled engine, which, of necessity, must be much hotter than its water-cooled sister?

Does "C.P.S." forget the radiator, which is giving up the heat from the water to the atmosphere as fast as it can?

G. DOWSE, A.M.I.C.E.

Sir,—In reference to the editorial note at the foot of my letter, which you were good enough to insert in the issue of the 28th ult., may I suggest that the coefficient you use is in feet per second units, and mine in miles per hour? In the *Practical Engineer* pocket book for 1911 I find the wind resistance per square foot per mile per hour given as $.00492V^2$ and per foot per second $.00288V^2$.

The Eiffel Tower figure is .0036 in miles per hour, but a large allowance has to be made in applying a coefficient of this nature, derived from rectangular plates, to so complex a body as a motor cycle and passenger. I think it is clear that were the Eiffel Tower plates to have fixed in their rear a corrugated sided box a much larger coefficient would be obtained.

As regards the Brooklands figure, I believe insufficient regard was paid to the disturbance caused by the towing car. In fact, the only method of achieving reliable results is to do as Froude did with H.M.S. *Greyhound*—tow the body whose resistance is desired from the end of a very long boom, clear of the wake of the towing vessel.

Lastly, the internal evidence shows that the total resistance must be nearly double that obtained by the use of so small a coefficient as .002, or, alternatively, motor car engineers are designing extremely inefficient engines, for .15 gallon per horse-power hour is about 1.1 lb., whilst small crude oil engines run on .4 and large ones on .3 and even less.

W. R. GERALD WHITING.

[Our figures are in m.p.h., not in f.p.s. as our correspondent suggests. We are aware that some authorities give a higher constant (Carus-Wilson .00254 and D. K. Clark .00585). We quote from the R.A.C. system of handicapping: "It is luckily, however, fairly easy to obtain a reliable factor from existing data, at any rate a maximum factor. Both the 45 h.p. Mercédès and the 30-40 h.p. Daimler are well known to be capable of attaining a level road speed of 60 m.p.h. with an expenditure of about 45 h.p. If the efficiency be taken at 66% (which is, we also know from experience, a fair figure), 30 h.p. remains to utilisation at the road wheels. Of this, with the low figure of 40 lbs. per ton for rolling resistance, 10.4 h.p. is expended in overcoming road resistance, leaving 20 h.p. approximately to be utilised in overcoming the air resistance. If the area of a car be taken as 20 square feet, which is a very low estimate for it, then the factor becomes .0017 and the equation for $P = .0017V^2 20$. Though it is felt that .0017 may be a somewhat high figure, it nevertheless is recommended for adoption." In this case the h.p. is 20, and we get the following equation, k being the constant:

$$\text{H.P.} = 20 = \frac{60 \times 60 \times 20 \times 88 \times k}{550}$$

$$\text{or } k = \frac{20 \times 550}{60 \times 60 \times 20 \times 88} = .0017.\text{—Ed.}]$$

Sir,—With further reference to my notes on petrol consumption, I have, through the courtesy of Messrs. H. A. and C. R. Collier, been able to work out the ton-mileage of a Matchless motor cycle travelling at very high speed. In such a case the time in which a gallon of fuel is burnt is, of course, reduced, and the figures obtained are interesting.

The cycle and rider weighed 397 lbs., the wind resistance area is estimated at 5 sq. ft., the speed is taken at 70 m.p.h., and the petrol consumption was 14 pints per hour.

Now the wind resistance alone at this speed accounts for about 22.4 b.h.p., and, taking the consumption at .5 pint per b.h.p.-hour, this requires 11.2 pints, leaving 2.8 pints for other purposes.

Now, 397 lbs. driven 70 miles in an hour equals 12.35 ton-miles, and this was achieved with 2.8 pints of petrol, which works out at about 35 ton-miles per gallon.

This compares very favourably with the car at 37.5, calculated on the same basis.

If you neglect to deduct the b.h.p. absorbed by wind resistance, the ton-miles per gallon work out at only 7.06, which is absurd.

I venture to think, therefore, that the motor cycle is not to blame, for it is clear that to attempt to use the ton-mile formula without any factor to adjust it for speed and wind area is not only absurd but totally misleading.

This is very apparent if one considers the two results that would be obtained on a motor 'bus travelling at 8 and 24 m.p.h. respectively. As a matter of fact, to speak of ton-miles per gallon as at present computed is like speaking of nominal horse-power—a term we are all anxious to kill. Can we not kill them both and bury them together?

A. H. MITCHELL.

The A.C.U. and the M.C.P.A.

Sir,—We think that at this stage in the history of the A.C.U. it is very important to make known, especially to members of affiliated clubs and prospective touring members, the *raison d'être* for the M.C.P.A., and what it is aiming at. Briefly then, we came into being as an Association because

(a) We consider that the A.C.U. up to the present has lamentably failed to make good its undoubtedly strong claim to the support of motor cyclists, as a whole, and consequently has failed to attract members in anything like the numbers that the movement warrants.

(b) The A.C.U. has hitherto failed to keep sufficiently in touch with its affiliated members—especially those of the provincial clubs—with the result that unnecessary friction has arisen, powerful clubs have refused their support, the interests of provincial clubs have suffered, and the movement has been weakened in consequence.

(c) The policy of the A.C.U. in regard to competitions has been vacillating and variable; it has reserved to itself competitions which should have been left to the affiliated clubs—thereby competing with its own constituent members—and *diffused* its executive energies, instead of *concentrating* them upon such classic events as the Isle of Man races, six days' trials, etc.

One unjust criticism of the movement is that the M.C.P.A. is formed by, and for, men who have "axes to grind," as evidence of which stress is laid upon the number of members connected with the trade.

The M.C.P.A. is formed with the one object of making the A.C.U. a body to be proud of—useful and powerful in all matters affecting motor cyclists. It was promoted by private members. It is happy in having the assistance and hearty co-operation of several prominent trade men. It will always support adequate representation of the trade upon the General Committee, but it will resolutely oppose any effort to take the government out of the hands of the private owner.

The A.C.U. is primarily an organisation of private owners, and the trade has sufficient commonsense to recognise fully that position, notwithstanding what has been stated to the contrary.

The unworthy suggestion that we have "axes to grind" can be dismissed with the contempt it deserves.

At the annual general meeting of the Council, one of our critics asked why our members already on the A.C.U. committee had not made the A.C.U. what it should be. The answer is that, although some of our members have worked—and worked well—for reforms in the past, they have been overweighted by the *personnel* rather than the numbers of the opposition.

We need, and ask for, the support of the affiliated clubs, as we have asked for and received the full support of the private members. We are sending out a list of men known to be keen motor cyclists whom we suggest should be elected to represent the affiliated clubs on the General Committee.

We hope the provincial clubs will realise that our desire is to have them *actively* represented. It is of no use electing a member of a remote provincial club (although he may as an individual be better than any other man on our list) unless he really can and will attend committees. The better plan is to elect a man residing in or near London, and then see that he fully represents the club's wishes and opinions on every occasion.

If this be done, we venture to think that we shall say good-bye to the friction and failures of the past, and, with a united, energetic committee backing up the new secretary, shall lift the A.C.U. into the position it should occupy in the future.

OTTO THOMAS, Chairman M.C.P.A.
W. G. McMINNIES, Hon. Secretary M.C.P.A.

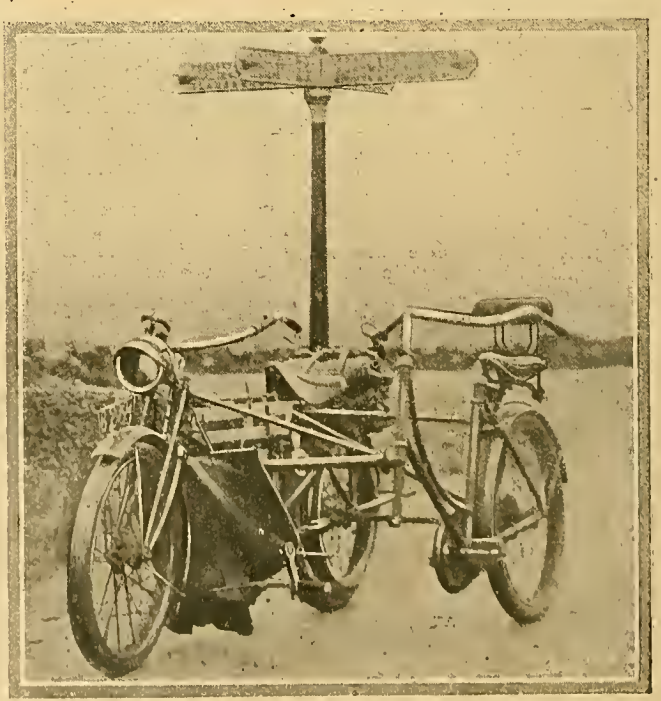
Experimental Work in Variable Gears.

Sir,—Regarding "Ixion's" comments on experimental work in variable gears in the issue of March 21st, we wish to back up his statements that inventors and engineers are working behind the scenes on this one important factor.

It will be in the near future when "Ixion" will see his ideal variable gear in actual existence. We have been designing and experimenting for some time past a gear invented by Mr. J. Rowe, Ilford, which will shortly be put on the market, and known as "P. and P." gear. This will be adaptable to fit all engines without alteration. It has no jockey pulley, neither is it necessary to use a sliding back wheel. The gear fits direct on to the engine-shaft just like an ordinary pulley. It is infinitely variable, and is combined with a free engine. The whole is self-contained and controlled (belt slack taken up, gear ratio altered, etc.) with one lever.

pp. PACKER AND PRENTIS.
J. H. PRENTIS.

Pillion Carriers.



Sir,—In reply to Mr. G. H. Wait's letter in your issue of March 21st, my experience goes to prove that carrying a passenger pillion fashion is not at all dangerous, and that the slight risk, wear, and tear, etc., are not comparable with the extra pleasure to the motor cyclist or passenger.

Naturally, if the rider takes corners at 30 m.p.h., and the passenger enjoys the sensation to the extent that he allows him to travel at this speed, then they must both be on the look-out for trouble; but taking Mr. Wait's two points, first regarding the carrier not being strong enough.

This is the first thing the rider who contemplated doing any pillion carrying would assure himself of by having, say, two extra struts fitted

Now the second point, regarding back tyre not being strong enough. Has Mr. Wait any costs or data to back this statement? It may be of interest to him to read the letters of mine you published in your issues of October and December 28th, 1911, and to see the photograph of passenger and myself. If he will go carefully into my running costs he will find that I bought only one tyre during a season's running of over 11,000 miles, this being a T.T. Hutchinson, and that one of the two original ones was retreaded, but this is with a 2½ h.p. A.J.S., not a 3½ h.p. machine, which I pointed out in my letter requires considerably more for tyre upkeep.

BASIL ADAMS.

Several readers having asked for further particulars regarding the cycle passenger attachment described in the letter signed "A. L.," and published March 14th page 271, we reproduce herewith an illustration of the combination which is the work of A. Campbell, West Lothian, N.B.

CURRENT CHAT

TIME TO LIGHT LAMPS.

April 11th	... ...	7.47 p.m.

,, 17th	... ...	7.57 ,,

Next Meeting of the B.M.C.R.C.

The next meeting of the B.M.C.R.C. at Brooklands is fixed for Saturday, April 20th. Four events are down on the programme—(1) Time trials; (2) three-lap 500 c.c. scratch race; (3) five-lap cyclecar race; (4) one hour all comers' race.

Weather Forecasts.

The A.A. and M.U. have arranged for information as to weather conditions to be telegraphed to their head office every morning from various points on the main roads round London. This information will be available to members at 9 a.m. on application either by telephone or telegram both week days and Sundays.

Brighton to Worthing Road.

A correspondent in South Lancing complains of the very bad surface of the road along the shore from Brighton to Worthing. Between Shoreham and Southwick repairs were in progress last week, and the new metal was laid four inches deep the full width of the road and unlighted. The lower road through Shoreham, Southwick, and Fishergate is unfortunately no better.

R.I.A. Notes.

Schemes for the improvement of Cogan Hill, Penarth; the easing of the corners at the north and south ends of Healdon Road, Whitchurch, Glam.; the erection of signs on each side of the Church Road crossing of the Merthyr Road, Whitchurch, and the efficient lighting of the first central tramway standard at the entrance to the city of Cardiff were among the more important matters dealt with by the South Wales Centre of the R.I.A. at its last meeting.

Air-cooled Engines and Low Temperatures.

On the occasion of a lecture by Sir Ernest Shackleton, at the R.A.C., on his last Polar Expedition, he referred to the trouble he had experienced through overheating of the air-cooled engine employed on the motor sleigh used by his party. There seems to be no doubt whatever that a low temperature has comparatively little effect upon an engine cooled by air, and it is interesting to note that Capt. Scott's motor sleigh was so much troubled by this failing, even though the temperature was much below zero, that the sleigh had to be abandoned altogether. The opinions of readers in very cold and very hot countries would prove of great interest, especially as so many cyclecars are air-cooled.

A Belgian Motor Cycle Trial.

The Moto Club Liègois, Hotel Schiller, Place du Théâtre, Liège, is organising a reliability trial for motor bicycles on May 25th; entries close May 16th. There will be three classes—(1) Up to 300 c.c.; (2) 400 c.c.; (3) over 400 c.c. for one-cylinder machines. The motor cycles must be equipped as touring machines, with spring forks, efficient mudguards, two brakes, stand, carrier, lamp, and generator. Silencers must be fitted, but cut-outs may be used. Auxiliary exhaust ports may not be fitted. During the trial there will be a speed trial on the level, a speed trial up hill, and a starting test up hill. In the speed trial on the level Class 1 will be expected to do 45 k.p.h.; Class 2, 50 k.p.h.; Class 3, 55 k.p.h. In the hill-climb the following maximum speeds must be maintained: Class 1, 24 k.p.h.; Class 2, 28 k.p.h.; Class 3, 32 k.p.h. In the starting test on the hill competitors must be in their saddles at 15 metres from the start and they can pedal for the following 15 metres afterwards. The route will be from Liège to Bastogne (lunch), and Bastogne to Bouillon. Next day, from Bouillon to Phillipeville (lunch), and then back to Liège. At the luncheon (one and a half hours) and other stopping places the machines will be parked in enclosures, when nothing may be done to them.

SPECIAL FEATURES.

HOLIDAY EVENTS (illustrated).
New Racing Engine.
Future of the A.C.U.

The F.I.C.M.

A proposal is on foot to re-establish the International Federation of Motor Cyclists, or, to give it its correct title, the F.I.C.M., which signifies Fédération Internationale des Clubs Motocyclistes. This body was originally founded immediately following the first International Cup Race with the object of encouraging and looking after international events. The clubs affiliated were the Auto Cycle Union, the German Club, the Austrian Club, the French Club, and the Danish Club. As the interest in motor cycling died away on the Continent, first one club and then the other dropped out, and finally the A.C.U. alone paid its subscription, which it did until 1908.

The result is that £127 of the funds now remain in the possession of Mr. G. F. Sharp, who acted as honorary treasurer to the Federation. Of this, about half is due to the A.C.U. The idea to re-establish the Federation to control international events is a good one.

A MOTOR CYCLE WEDDING.

W. E. Grange, a well-known Harrogate motor cyclist, was married on Easter Saturday, riding to church on his Bradbury and afterwards taking his wife home on the pillion seat. Witnesses of the happy event also journeyed to church on a motor cycle and sidecar. Later in the morning Grange took his wife to the Leathley Bank Hill Climb, and made fastest time in Class 3.

Turning the Tables at Oakamoor.

H. Riddell (8 h.p. Blumfield) won Class 4 at the Oakamoor hill-climb, scoring over George Brough (8 h.p. Brough), who had his revenge in the all-comers' event by reversing the order.

Accident to V. Olsson.

Vivian Olsson, who had the misfortune to meet with an accident on Easter Monday, may be sure of our deepest sympathy, and that of a very large number of motor cyclists. He is a well-known competition rider, and popular wherever he goes.

Sidecar Records.

When F. W. Barnes created four new sidecar records at Brooklands on the occasion of the first B.M.C.R.C. monthly meeting, he used a side by side valve twin Jap engine of 85.5×85 mm. on his Zenith. Barnes's average speed for the 100 miles was in the neighbourhood of 50 m.p.h.

Spanish Motor Cycle Race.

Vernon Taylor went to Spain last week-end to compete in a road race on his Rudge. He says he met with two other Rudge riders, and they had some exciting racing over a very dangerous course with frightfully right angled corners. Taylor says he had two pieces of rock thrown at him—one hit his front wheel, the other cut his eye. There were thirty in the race, some from Paris. The course was Bilbao to San Sebastian.

Motor Cycling in Australia.

A series of open hill-climbing contests was held by the South Australian Motor Cycling Club up Greenhill Road, over a course measuring 4 miles 148 yards. The winner was H. H. Ragless (3½ h.p. Triumph), who covered the course in 7m. 26⅗s., thereby winning his fifth consecutive gold medal. First place on formula and second place on speed by gained by N. K. Torode on the same make of machine. The amateur class was won by H. Crowle, who secured the Continental twenty guineas rose bowl.

Motor Cycle Signpost.

Quite a novelty in signposts has been erected at Masons Hill, Bromley, on the Sevenoaks Road. Over each arm appears a large model of a motor bicycle, aeroplane, and car. The arm pointing in the Sevenoaks direction reads "Hastings, Paris." In the reverse direction "London, John-o'-Groat's," whilst a third arm, over which is a model motor cycle, reads, "Croydon, Brooklands, and Land's End." It was made by the proprietor of an adjacant garage, and attracts a good deal of attention.

FUTURE EVENTS

April 13.—Oxford M.C.C. Hill-climb.
" 13.—Liverpool A.C.C. Open Reliability Trial.
" 20.—B.M.C.R.C. Race Meeting.
" 20.—Bristol M.C.C. Open Hill-climb
" 27.—Bristol B and M.C. Open Hill-climb.
" 27.—M.C.C. Open Silencer Trial.
May 1.—Birmingham M.C.C. Open Hill-climb.
" 4.—Coventry and Warwickshire M.C. Open Reliability Trial.
" 4.—Mersey M.C. Open One-day Trial.
" 4.—Dublin M.C.C. Open Reliability Trial.

Fined for Obstruction.

At Gloucester County Police Court, on the 6th inst., Charles de Lisle Wells, farmer, of Noke Farm, Hucclecote, was summoned for wilful obstruction by Sydney D. Lane. Complainant was driving a sidecar, and when about twenty-five yards from defendant he sounded his horn. Defendant looked round, and then deliberately pulled his horse across the road on to his wrong side, and an accident was narrowly averted. J. O' N. Martin corroborated, and said that the action of defendant, about whose conduct complaints had previously been made, appeared to be intentional. Defendant denied the charge, but was very properly fined £2 and costs. We congratulate both the complainant and the Bench.

Police Trap.

We have received information of a police trap working on the Harrow Road on the south side of the hill. There is another at Stilton, on the Great North Road.

A Regrettable Accident.

A fatal accident to a sidecarist occurred at Birmingham on Saturday last, the unfortunate driver, E. J. Berry, colliding with the kerbstone in attempting to avoid a tramcar and being thrown heavily.

Motor Cycle Road Guide.

One of the inspectors of the newly formed R.A.C. road guides attracted attention on the Sevenoaks and Maidstone roads during the holidays. He rode a new Rudge motor cycle, and wore a smart grey uniform with peak cap.

Eastertide.

There was a record number of motor cycles on the road at Easter. Except for the strong winds, which churned up the dust in clouds, riding conditions were exceedingly good. The enormous popularity of the sidecar cannot fail to have impressed the most casual observer.

A Misstatement.

The Wilkinson T.M.C. Co. have written us to point out there is no truth in a statement made elsewhere that they intend to use a slide-valve engine for their 1913 models, being quite satisfied with the four-cylinder water-cooled engine now being used.

Speed Limits in Ireland.

An application has been made to the Irish Local Government Board by the Lisburn Urban District Council to confirm a byelaw limiting speed of all vehicles within the urban area to nine miles an hour. The L.G.B. hold the view that the byelaw could only be confirmed in regard to the entire urban district and could not be limited to certain strects, and if a speed limit were required on the main streets application should be made under Section 9 of the Motor Car Acts. The matter is now under the consideration of the Irish L.G.B. and the Irish A.C.

CLIMBING HOLNE CHASE IN THE LONDON-LAND'S END-LONDON RUN.

(1) On the hairpin bend, near Ashburton.

(2) G. B. Fry (three-speed Quadrant) on the steepest gradient.

THE RICHMOND MEET.

Group of motor cyclists assembled around the cross in Richmond Market Square.

ALTHOUGH the Northern League of Motor Cyclists has been disbanded, and no official arrangements were made for holding the now old-established meeting at Richmond this year, nearly as many as ever turned up, as in previous years, and spent the greater part of last Friday there. An exceptionally strong head wind faced the riders from the east and made it very unpleasant riding down the Great North Road, and, in addition to this, the morning dawned dull and inclined for rain, which, however, kept off.

This year the visitors were later than usual, but towards noon they arrived thick and fast, and by one o'clock the Market Square had all the appearance of previous years. Amongst the first arrivals we noticed Mr. Geoffrey W. Liddle, that energetic member of the Middleshro' Club, who is, we believe, the originator of the gathering. Mr. Liddle's club had, we were informed, the largest muster this year, and had run a competition to Richmond, which example had been followed by the Leeds, Pontefract, Doncaster, and other clubs.

The catering arrangements this year were very bad, and it was exceedingly difficult to get a meal anywhere.

A great many of the machines had sidecars attached, and very few lightweights were noticed, although most makes of machines were represented. The cyclecars present were two Morgans and a Bradford made runabout, Mr. F. Langton (Leeds M.C.C.) had also a T.M.C. and sidecar.

This year there was no meeting in the Town Hall, so the visitors were off on the homeward journey a little after three o'clock.

The clubs had, as usual, arranged competitions *en route*, Middlesbrough having a big muster of members present, whilst Darlington and District ran a good second. Other clubs that mustered in force were: Leeds, Pontefract, Newcastle, Hull, and Bradford. The Leeds speed-judging competition was won by F. Green, who judged the twenty-two miles within 1¼ minutes (early).

Motor cyclists leaving Richmond after the Good Friday meeting.

STAXTON BROW HILL CLIMB.

THIS annual fixture, held conjointly by the Harrogate and Scarborough clubs, and open to their members only, was duly contested on Easter Monday. There were six classes for motor cycles, but one of these was cancelled. Classes 1, 2, 4, 6, and 7 were decided on formula.

Class 3 was decided on time. The results were:

CLASS 1.—Standard lightweights not exceeding 350 c.c.

1. F. Mackay (2¾ Humber)
2. J. Mackay (2½ Singer)

CLASS 3.—Any single on time.

1. D. Gill (3½ Calthorpe)
2. D. Bradbury (3½ Norton)

CLASS 4.—Standard touring singles.

1. D. Bradbury (3½ Norton)
2. J. L. Emmerson (3½ Norton)
3. G. H. Storey (3½ Norton)

CLASS 6.—Sidecars and cyclecars.

1. B. Gash (own make)
2. Vernon Gash (Zenith and sc.)

CLASS 7.—Any machine not later than 1909.

1. J. H. Dale (1908 Triumph)
2. W. J. Turner (1909 Triumph)

The final for the Tranmer Trophy was won by D. Bradbury (1912 3½ h.p. Norton), whose speed averaged 34.8 m.p.h against a 50 m.p.h. gale of wind.

HILL-CLIMB AT LEATHLEY BANK.

Successful Inter-club Event in Yorkshire.

Two aspects of the bad corner on Leathley Bank.

(1) K. Clark (3½ Coran-Jap) grazes the bank at the roadside. (2) E. R. Davies (3½ Triumph) third, negotiating the corner with good judgment.

THE open hill-climb arranged jointly by the Harrogate and District M.C.C. and Herts County A.C. at Leathley Bank last Saturday proved a great success. The entry list totalled over 100; the sport was good and exciting, Dame Fortune was kind in the matter of weather, no untoward accident occurred, and the hundreds of spectators who congregated near the summit seemed well pleased with their afternoon's outing.

Leathley Bank is a long climb situated between Otley and Harrogate, and will be recalled as the test hill in the A.C.U. penalty run a couple of years ago. It commences with a long gradual rise, with easy curves, then a level stretch, a right angle turn to the left, which leads to the steepest section, which was approximately 1 in 5½. The course measured threequarters of a mile in length. It is worthy of mention that both the organising secretaries were competing—C. C. Cooke on his Triumph and H. W. Fortune on a Brown. Both did well.

After the weighing operations and examination of the machines at Beckwithshaw in the morning, a move was made for Leathley, four miles distant. Practising was permitted till 1 p.m., and during this period an exciting incident occurred. Miss Berend, who had driven her O.K.-Precision sidecar from town in the inter-team reliability trial, had lent it to a lady friend to drive over to the hill. The brakes on the machine required adjustment, and on the 1 in 5½ gradient the machine got out of hand, the frightened driver and her passenger shrieking "Can't stop" as they tore down the hill at a fast pace. The machine was travelling too fast for anyone to dash out and check its flight, and to avoid a serious accident the fair driver had to round the bad bend at over 20 m.p.h. This she did with great skill, the helpless spectators looking on with bated breath. Neither wheel lifted, but the tyre was almost wrenched off.

Mile a Minute Speeds Uphill.

A fairly prompt start was made with the hill-climb. A flying start was allowed, and with a boisterous wind behind it was estimated that some of the competitors exceeded a mile a minute in parts. A regulation which caused a good deal of dissatisfaction was the one prohibiting competitors to touch the ground with their feet in rounding the bends. It has become quite a habit with most of the well-known riders, and one or two did it unconsciously and were, unfortunately, disqualified.

Class I., for lightweights, was chiefly remarkable for the speed of H. C. Newman's Ivy, which has the new long stroke 2¾ h.p. Precision engine. He was faster than the majority of 3½ h.p. riders. Miss Berend's O.K. had a similar engine, and her time was good considering that she grazed the bank at the corner and almost stopped. She was applauded for her skill in recovering. The officials interpreted the rules very strictly, and a number who used overhead valve engines in the standard classes were disqualified. F. W. Barnes (Zenith) was one of these. P. H. Goddard (Douglas) pedalled and suffered a like penalty. F. G. Edmond's exhibition on a 2 h.p. Humber was deserving of great praise. For such a diminutive engine to account for 1 in 5½ with a single gear is an undoubted proof of efficiency, though Edmond's daring corner work undoubtedly helped to win him first place.

Formula prizes only were awarded, and we give the order of the first six.

CLASS I.—Standard lightweights up to 350 c.c.

		Fig. of merit.	Time.
			M. S.
1.	F. G. Edmond (2 Humber)	70.94 ...	1 32⅘
2.	H. Berwick (2¾ New Hudson) ...	85.25 ...	1 20
3.	H. C. Newman (2¾ Ivy Precision) ...	88.89 ...	1 14
	Jim Mackay (2½ Singer)	89.99 ...	1 31⅕
	E. R. Davies (2¾ Hazelwood) ...	90.32 ...	1 43
	C. A. Nettleton (2¾ New Hudson) ...	91.53 ...	1 53⅕

Disqualified for using overhead valve racing type of engine:

F. W. Barnes (2¾ Zenith) ... ... 68.99 ... 1 17⅘

H. C. Newman (2¾ Ivy Precision) finishing a fine ascent. He was the most successful competitor.

There was a remarkable occurrence at the Leathley Bank hill-climb. J. L. Kershaw (3½ h.p. Rudge) overshot the corner, ran up the bank much higher than depicted in the snapshot, and dropped perpendicularly on to the road again unscratched.

In the T.T. lightweight class, J. Dudley had the cylinder head blow off, grazing his leg. The winner's time was slightly slower than in Class I.

CLASS II.—T.T. lightweights up to 350 c.c.

1.	F. W. Barnes (2¾ Zenith)	68.99	...	1 17⅘
2.	H. G. Dixon (2¾ New Hudson) ...	86.04	...	1 27⅕
3.	Jim Mackay (2½ Singer)	88.02	...	1 29⅕
	H. C. Newman (2¾ Ivy Precision) ...	89.03	...	1 14⅖
	Fred Mackay (2¾ Humber)	96.06	...	1 33⅘

Nine Competitors Disqualified.

The class for standard single-cylinder machines up to 600 c.c. brought out thirty-one competitors, of whom nine were subsequently disqualified for riding semi-T.T. machines. The nine included the four fastest riders, so that W. E. Grange (Bradbury) was lifted from fifth to first place. By the way, Grange was married that morning, and took his wife to the hill on a pillion seat attached to the back carrier. Slaughter (L.M.C.) was going splendidly, but took the corner too fast and grazed the bank which slowed him considerably on the all important steep stretch. Many spoilt their chances in this way. A most remarkable incident occurred later. J. L. Kershaw (Rudge) rounded the bend at a perfectly crazy speed, shot up the grass banking, sweeping aside bushes, and then dropped perpendicularly a couple of yards on to the road again, neither his machine nor himself damaged in the slightest. H. V. Smytheman (Ivy) promised to emulate this feat, but his wheels met something hard, and he came to a sudden stop.

CLASS III.—Standard singles up to 600 c.c.

1.	A. J. Dixon (3½ Zenith)	92.90	...	1 17⅗
2.	D. Bradbury (3½ Norton)	108.41	...	1 27⅗
3.	J. Slaughter (3½ L.M.C.)	108.63	...	1 21⅕
	C. A. Nettleton (3½ New Hudson) ...	109.13	...	1 40⅗
	W. E. Grange (3½ Bradbury)	109.52	...	1 12⅖
	B. D. Shaw (3½ Norton)	112.63	...	1 21⅗

Six were disqualified for not conforming to the rules regarding standard pattern machines, including the two leaders:

H. C. Newman (3½ Ivy-Precision) ...	89.06	...	1 3⅕
J. Woodhouse (3½ Regal-Precision) ...	89.21	...	1 6⅗

There was nothing exceptional in the class for T.T. singles, though it was remarked that the Triumph representatives, Newsome and Cheshire, had a different style of cornering from the others, and that was to rush at full speed nearly to the corner, lift valve, and apply brakes, and, as soon as the course was clear, drop the valve again. This was by far the safest way, and it also gave the machines a chance to pick up, which they did splendidly.

CLASS IV.—T.T. singles.

1.	F. W. Barnes (3½ Zenith)	89.10	...	1 13⅕
2.	H. C. Newman (3½ Ivy Precision) ...	89.15	...	1 3
3.	J. Woodhouse (3½ Regal Precision) ...	90.3	...	1 7⅗
	W. F. Newsome (3½ Triumph) ...	102.6	...	1 4⅗
	D. Bradbury (3½ Norton)	102.9	...	1 23⅕
	J. Slaughter (3½ L.M.C.)	104.9	...	1 18⅖

Dearth of Multi-cylinder Machines.

E. A. Colliver (6 h.p. Zenith) rode with great skill, and rounded the bend with excellent judgment. He beat Barnes and Fawcett on similar machines for speed, and protested emphatically when informed that he touched the ground with his foot at the corner. He was ultimately awarded the premier position.

CLASS V.—Standard multis.

1.	E. A. Colliver (6 Zenith)	122.1	...	1 2⅘
	H. E. Taylor (4½ F.N.)	135.6	...	1 54⅕
	W. Fawcett (6 Zenith)	140.3	...	1 12⅕
	Disqualified for using feet round corner:			
	F. W. Barnes (6 Zenith)	122.5	...	1 4⅘

There were about seven competitors in the passenger class, and one of these stripped his timing gear in descending the hill. By far the best exhibition was by H. G. Dixon on a 3½ h.p. three-speed New Hudson, with H. Berwick in the sidecar. Spectators could hardly believe their eyes as they watched this 3½ h.p. single cylinder approach at a faster speed than some of the bicycles. Once round the bend the machine even gathered speed, yet we witnessed several machines up to 7 h.p. fail.

CLASS VI.—Passenger machines.

1.	H. G. Dixon (3½ New Hudson and sc.)	85.3	...	1 43
	F. W. Barnes (6 Zenith and sc.) ...	97.2	...	1 23⅖
	C. M. Hellier (8 G.W.K. runabout) ...	101.9	...	2 0⅕

The "any single" class was captured by Howard Newman, who made the fastest ascent of the single cylinders during this ascent, though hard pressed by P. Weatherilt, who made a daring climb. Still, Newman lost the award for using his foot at the corner. F. Mackay (Singer) made a practice of grazing the bank every time he came up. H. J. Pooley (Premier) was going well when, at the corner, his machine slid from under him. Result on time:

CLASS VII.—Any single.

	c.c.	m.	s.
P. Weatherilt (3½ Zenith)	493	... 1	3
W. F. Newsome (Triumph)	499	... 1	4
E. W. Cheshire (Triumph)	499	... 1	5⅘
C. C. Cooke (Triumph)	499	... 1	10⅗
H. G. Dixon (New Hudson)	499	... 1	11⅘
K. Clark (Corah-Jap)	493	... 1	12⅗

Fastest time: H. C. Newman (Ivy Precision), 1m. 2⅖s.

F. W. Barnes, riding the 8 h.p. Zenith, accomplished the fastest climb in the "any multi" class—60½ sec.—travelling at a terrific speed on the lower stretches, though negotiating the corner cautiously. Result:

CLASS VIII.—Any multi.

F. W. Barnes (6 Zenith)	986	... 1	0⅕

E. A. Colliver (Zenith), 63s., disqualified for touching ground with his foot.

C. M. Hellier (G.W.K. Cyclecar) making a neat ascent of Leathley Bank.

A.C.C.F. CIRCUIT DE PARIS.

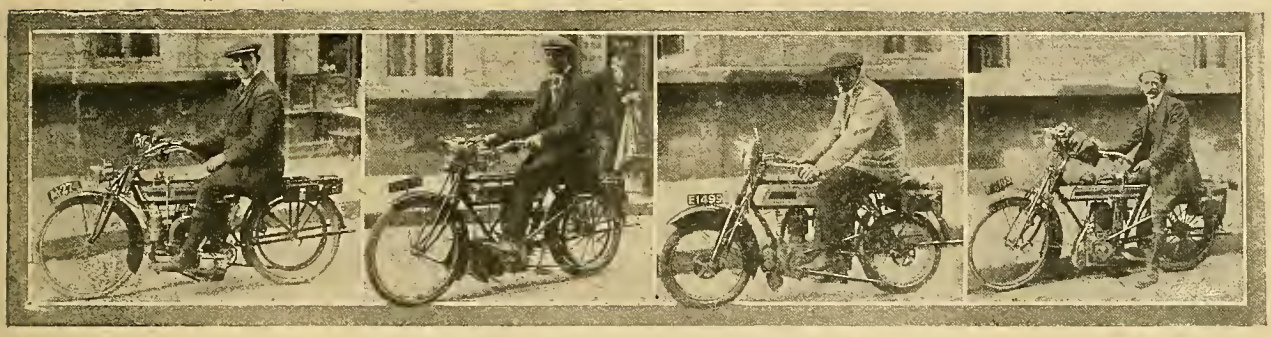
All the fourteen English competitors duly turned up at Charing Cross on Friday last. There was, of course, a good number of people travelling by the boat train, and consequently it was somewhat of a rush getting the machines registered through to Paris. Several had left things to the last minute, and Mr. Beasley, the Auto Cycle Union Assistant Secretary, had to put in an appearance on Good Friday morning with tickets and International passes for those who had not obtained them before hand. Pratt, Olsson, and several other well-known riders

Competitors passing through Clement de Vay.

came to see the English team off. Kilpatrick had ridden up from Portsmouth in the morning with his friend Heighton, and had lost no time in doing so. He passed through Guildford in the early hours at a speed slightly in excess of that allowed by law, and was promptly called to book by a policeman. "Can't you see this plate?" said the redoubtable rider, pointing to the G.B. plaque. "Beg pardon, sir," said the man in blue, and saluting he let him go. The South-Eastern Railway people were evidently somewhat muddled owing to the Easter rush, as will be seen from the following examples of weighing and calculation: Rex Mundy's Singer weighed 172 lbs. and cost £1 5s. 6d., Lister Cooper's Triumph weighed 200 lbs. and cost £1 6s. 9d., Cook's A.S.L. weighed 188 lbs. and cost £1 16s. 4d.; the attention of the A.C.U. will be called to these figures.

Confusion.

Although the competitors gave considerable assistance to the railway staff at Folkestone, they were not allowed to touch the machines at Boulogne, as, being registered, the railway company were responsible. At the French port McMinnies and Griffith ascended on the crane platform with their machines, and as they went up the porters shouted, "Adieu, Monsieur Blériot." The Paris train was divided into two portions. Five of the men caught the first part, and as the crossing had been a rough one, the boat was late, and there was no time for lunch, they had to go hungry to Paris. These five competitors were duly met by Messieurs Debailly, Buissard, Lecomte, and Fenton, and a few minutes afterwards the second batch arrived. These took their machines straight into the customs house and so missed those who were there to meet them. This caused some confusion, and had it not been for Davis, a friend of Fletcher, it might have gone badly for this section of the party. However, all's well that ends well, and it eventually turned out that the English party was distributed among three hotels within a quarter of a mile of one another.



On Saturday afternoon the sealing took place at the Garage Edinbourg, kindly placed at the disposal of the Auto Cycle Club de France by its proprietor. On Sunday, the 7th inst., we all made an early start, and duly reached the official starting point, the Porte Dorée. No sooner had we got our pass-out checks from the Octroi, declaring the amount of petrol in the tanks, than the *gardiens* of the Forest of Vincennes refused to allow us to proceed, and we had perforce to make for the Porte de Charentois, where a start was eventually made at 7.30 a.m.—half an hour late.

Pave at the Start.

The men were started in groups of four at one minute intervals, and once under weigh there ensued some miles of the worst *pavé* to be found in France. Soon, however, the roads improved, and we made good progress till Villeneuve-St. Georges was reached, when the surface again became appalling. The English motor cycles stood the racket fairly well, but my stand refused to remain *in situ*, and had to be fastened with string. The road was alternately good and bad till we reached Fontainebleau, where was the first control; this was prettily situated in the forest. It did not matter how early we were, all that we had to do was not to leave before the hour stated on our time cards. Once we had left Fontainebleau the roads became much better, and one and all enjoyed the spin. Reed's Dot was suffering from over-heating, but the rest of the team were happy. Montereau was the next control, at which only the sheets were signed. No times were taken in the next section ending at Coulommiers. The English team lost three men. Cook's back tyre burst; he fell and broke the frame. Reed had a sparking plug blown out and the point entered the tank, and the leakage of petrol resulted in his machine being burnt up. Lake retired with gear trouble. Mr J. R. Nisbet, who was spending the week-end in Paris, came and rendered the Englishmen valuable assistance. Another incident was the catching fire of my own machine, due to petrol being spilt on the silencer while the tank was being filled. Beyond the traversing of some bad *pavé*, at the beginning of which I found Kilpatrick with tyre troubles—a hitch which caused his ultimate retirement—nothing further exciting happened. At Compiègne not a bed was to be had, so most of us took train to Noyou, where the Auto Cycle Club had thoughtfully engaged rooms. We only had about five hours sleep, as we were called at 4.30 a.m., and taxis supplied by the Club conveyed us back to Compiègne. It was raining, and very cold, when we started at 6.30 a.m., while a strong wind blew dead against the competitors. Several complained of bad petrol, and my own carburetter was far from happy. Dover was soon to be put out of the running with tyre trouble, and had it not been for an English tourist, who lent him a spare tube, he would have fared badly. My

G. Griffiths (3½ h.p. Rudge Multi) travelling well in the hill-climb at Montanglaust.

SOME BRITISH COMPETITORS IN THE CIRCUIT DE PARIS.
F. Dover (3½ Premier). H. Lister Cooper (3½ Triumph). E. W. Cook (A.S.L.) G. L. Fletcher (2¾ Douglas).

bad time came next. The vent in my filler cap became choked with dust and caused symptoms of partial failure, which I put down to a choked jet. The day before the float was also punctured, and the gear rod needed adjustment. The bad roads, of course, started the float trouble, while the other small details are such as would easily cause delay to one who was riding a strange machine. This day's run was chiefly noteworthy for the splendid roads we traversed. Bad *pavé* was comparatively rarely met with, while the scenery on both days in such places as Fontainebleau, Chateau-Thierry, Compiègne, Vernon, and Rambouillet was really beautiful.

A Series of Mishaps.

Lunch was served at Vernon, and at the foot of the pretty descent to the town I found Heighton in trouble. His tank was almost empty, and when he jacked up the machine no petrol would reach the carburetter. I gave him some of the precious fuel, and was able to save another man to the English, now doomed to lose another rider, the ill-fated Rex Mundy, whose back wheel collapsed after his tyre had become deflated. Hillman tried conclusions with a dog at Les Thilliers and hurt his arm. As regards the Frenchmen, the riders of the Griffons suffered a good deal of trouble. They were followed by a car, the occupants of which, against the rules, doled out coils or accumulator when required. The Clément, which followed Enfield lines, ran well, and were much admired. Fenton had chain trouble, while the lightweight New Hudson was frequently seen stopped through carburetter trouble.

The *pavé* entering Versailles was execrable, but we managed somehow to survive it. Here the survivors' machines were placed in an enclosure. Pernette (La Française) arrived first, and someone presented him with a bouquet of flowers, which ought not to have been allowed, as nothing was to be gained by arriving first.

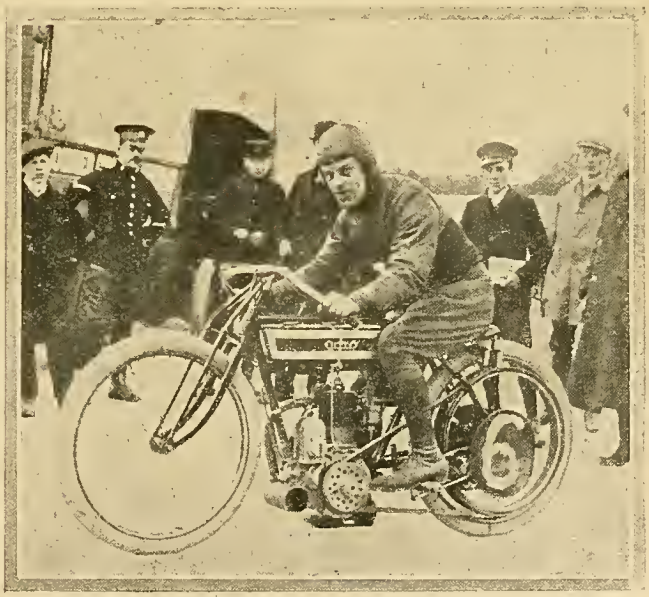
The following arrived at Versailles, where the trial virtually ended: Class I., up to 225 c.c., one N.S.U., two Motosacoches, and one New Hudson. Class III., up to 350 c.c., three Clément, of which one was ridden by Fenton, one N.S.U., two Peugeots, one Griffon, a Motosacoche, one Enfield (Bishop), and a Douglas (Fletcher). In Class IV., up to 500. Lister Cooper (Triumph) was the sole entrant to finish, while in the open class a Française alone finished. In the amateur class the Englishmen scored, Boileau (Douglas), McMinnies (Triumph), Hillman (Zenith), and Griffiths (Rudge), completed the course. In the Voiturette Class the Cohendet and Bedelia finished.

Personal Notes.

Although the Douglas I rode gave a little trouble, it behaved splendidly, and stood up to its work well, giving ample power, and, on account of its light weight, was most convenient to handle on the journey. Griffiths's variable Rudge, the tyre of which collapsed on the first day, causing him to swerve dangerously, did remarkably well, and he was nearly always in the van with the two English Triumph riders. Rex Mundy's Singer made fastest time in Class I. at Montanglaust, but this, of course, does not count, as he did not finish the course. H. Lister Cooper (Bradbury) made fastest time in Class IV., Pean (Peugeot) in Class III., and McMinnies (Triumph) in the Amateur Class. The hill-climb took place immediately after lunch—the hill itself can hardly be counted as such in English eyes, as the gradient is only 1 in 9 and the course two kilometres long, one kilometre being on the level.

The trial was well organised and altogether enjoyable, and was a credit to the French Club. The R.A.C. and A.C.U. left no stone unturned to make the journey a comfortable one.

E.M.P.B.



MOTOR CYCLE EVENTS AT BROOKLANDS.

Two motor cycle events were included in the Brooklands Easter meeting, which was run off in a boisterous wind that made riding very tricky. These were the Sixth Short Motor Cycle Handicap and the Fifth Long Motor Cycle Handicap, and they attracted twenty-five and twenty-four entrants respectively, of which twenty and nineteen riders started.

The first race, 5¾ miles, was won by about 200 yards by D. C. Bolton, 56s. start, whose Rudge was the same as was so successful at Oakamoor; G. E. Stanley (Singer), 1m. 22s. start, was second, and M. Campbell (Triumph), 1m. 22s. start, third.

In the second race, 8½ miles, Bolton was penalised 21s., and finished third, the winner being Stanley (Singer), 1m. 3s., who won by the length of the finishing straight from T. A. Manners-Smith (Triumph), 2m. 3s.

The handicapping of the two races appeared to be rather peculiar as, in the first race, Stanley (Singer) received 40 secs. start from Elce (Rudge), and in the second race they both started from the same mark.

G. E. Stanley (3½ h.p. Singer), winner of the Long Motor Cycle Handicap at the Brooklands Easter Monday Meeting.

M.C.C. LONDON-LAND'S END RUN.

FORTY-SIX COMPETITORS COMPLETE THE 550 MILES RUN TO SCHEDULE TIME.

J. R. Haswell (3½ h.p. Triumph and sidecar) at the secret control at Lebcombe Corner, Salisbury Plain.

IT was a dark but mild morning when the first man was punctually started from Staines on the 550 miles journey to the End and back. The competitors were got away punctually, and there appeared to be no hitch in the arrangements. At Basingstoke the dawn broke grey and cloudy, and most of the competitors here extinguished their lamps. Over Salisbury Plain the head wind gave us a foretaste of what was to come, and made the long slopes seem like severe hills. Through Salisbury and on to Shaftesbury; by this time the sun was shining intermittently, and everyone commenced to look happier, but a crop of punctures began to hinder the competitors. Nearly all the trouble we noticed was caused by tyres. Chard and Yarcombe were responsible for very few failures, as the surfaces were in fine condition. From Chard to Exeter the roads were very dusty, and great trouble was caused by the number of sheep and cattle which were being driven along the road.

After the lunch stop at Exeter, brilliant sunshine accompanied us through the beautiful district to Ashburton. We had purposely got ahead of the competitors so that we might see the fun on Holne Chase Corner, and we were in no way disappointed. Nearly all who did not know the corner overshot it and had to try again, and having got up they came down again to watch their friends' attempts. Among those whom we noticed make really good clean ascents at the first attempt were George Brough (6 h.p. Brough), H. R. Slingo (Clyno and sc.), H. Karslake (3½ h.p. Rover), R. C. Davis (Chater-Lea and sc.), W. Cooper (Bradbury), Holroyd (Motosacoche), who pedalled very slightly, G. T. Gray (3½ h.p. Rudge), Frank Smith (Clyno and sc.), F. C. North (Ariel), Alan Hill (Indian and sc.), and Eli Clarke and P. W. Moffat, both on Douglases. We had continued our journey before the last competitors had come up, so the above is not a complete list. Holne Chase was only the beginning of a series of precipitous grades, which were made even worse by half a gale of wind against the competitors. Dartmoor was enveloped in a mist, and this never really left us till St. Austell, where it turned to a sea fog.

An Encounter with a Bull.

The Cornish roads were very wet and heavy rain must have fallen during the day. Close to Truro some consternation and much amusement was caused by a crowd of competitors being held up by a bull. Though several riders were charged, everyone escaped serious damage except Frank Smith, whose sidecar was somewhat badly damaged; he, however, completed the course. George Brough, who had been running well to time, missed his way, and, though he checked in at Penzance, he had missed out the last check before that town.

Gwynne took a toss early in the day restarting after stopping for sheep, but, fortunately, he was not damaged, and completed the course to time. G. E. Purchase (Triumph) and A. C. Robins (3½ h.p. Humber) both retired at Two Bridges with belt rim trouble. F. Begeley (2¾ h.p. Hazelwood) ran into some water between Penzance and Land's End and came in soaked. Fifty-six riders finished the outward journey within schedule time, and started on the return trip on Monday morning. Rain commenced to fall when the first few competitors had started, and the Cornish roads were heavy and treacherous. Hayle, Camborne, and Redruth were all responsible for more or less serious skids, among the unlucky ones being C. Bailey (Rudge) and W. Cooper (Bradbury) who damaged his lamp and fittings. After Exeter practically no rain fell, and the roads again became dusty. It was a great relief to have the wind behind instead of plugging nearly all out against more than half a gale. The easier route, across Dartmoor, *via* Moreton Hampstead, was followed on the return, and, though this road includes some good climbs, very little difficulty was experienced by most competitors. At the lunch stop nearly everyone showed up and got out of Exeter well.

The check at the top of Chard Hill, near Honiton. The riders are H. R. D. Simpson (Ariel), H. C. Mills (Premier), E. B. Ware (Chater-Lea sidecar), and N. O. Soresby (Rudge).

Starting the second half of the ontward journey from Exeter.

up to time. Punctures were again the order of the day, but were not so common as on Saturday. After Basingstoke a lot of motor traffic was encountered and the dnst was bad.

The finish took place just after dark at the eleventh mile-stone from London, on the Honnslow Road, and forty-six competitors came in to time, thus qualifying for gold medals, subject to the times at the checks being correct. The riders finished in the following order:

F. J. Watson (3½ Swift)
E. Gwynne (3½ Triumph)
R. C. Davis (8 Chater Lea sc.)
S. C. Perryman (3½ Ariel)
H. R. Slingo (5-6 Clyno sc.)
E. Pond (Rudge)
H. Karslake (Rover)
H. Greaves (2¾ Enfield)
Eli Clark (2¾ Douglas)
J. S. Holroyd (2½ Moto-sacoche)
F. C. North (3½ Ariel)
B. Alan Hill (7 Indian sc.)
A. J. Sproston (Rudge)
W. Cooper (Bradbury)
W. Pratt (3½ P. and M.)
J. R. Haswell (Triumph sc.)
W. Gibb (2¾ Douglas)
P. H. Bentley (Triumph)
P. Grout (4½ Quadrant)
G. T. Gray (Rudge)
Frank Smith (5 Clyno sc.)
J. Milner (7 Indian)
P. Phillips (2¾ Douglas)
*P. W. Moffat (2¾ Douglas)
H. R. Whitmore (Rudge)
C. W. Meredith (Bradbury)
F. S. Procter (7 Indian sc.)
H. Gibson (3½ Bradbury sc.)
R. Owen-Wells (3½ Bradbury)
W. C. Hemy (Service Precision)
R. Lord (6 Rex Sidette)
N. O. Soresby (Rudge)
E. B. Ware (8 Chater Lea sc.)

A sidecarist making a good ascent of Holne Chase near Ashburton.

An unofficial check near Shaftesbury.

P. W. Tippett (3½ Humber)
A. R. Abbott (3½ Bradbury)
R. Croucher (3½ Kerry-Abingdon)
A. P. Maurice (3½ Premier)
A. J. Stevens (5 A.J.S. sc.)
C. Bailey (Rudge)
†J. Stevens (2½ A.J.S.)
F. W. V. Ehlvers (Triumph)
H. Johnson (Triumph)
S. Savage (Triumph)
S. T. Tessier (8 Bat sc.)
R. Charlesworth (3½ Zenith)
J. Chater Lea (8 Chater Lea sc.)

* Moffat was riding with Phillips, but stopped to help a competitor, so was credited with Phillips's time.

† J. Stevens did not sign on at the finish.

F. S. Procter got mixed up with a cow and a large stone in Devonshire and bent his front forks. A. T. Tamplin (6 Matchless sc.) is reported to have charged a wall on Dartmoor, but without serious damage to himself. R. Lord suffered from a broken sidecar frame, but patched it up and got home to time. Deacock (N.L.G.) also had trouble with his sidecar and did not return. A regrettable accident occurred near the finish, when V. Olsson (6 Trump-Jap) collided with a large car. Willing hands went to his aid, but the doctor pronounced a compound fracture below the knee, and he was wheeled to the hospital in an ambulance.

Our hearty thanks are due to Mr. Bidlake, who gave us a seat in the official six-cylinder Standard for the return journey as, owing to an argument with a dog, our motor cycle was *hors de combat*.

INTER-TEAM RELIABILITY TRIAL.

BARNET TO HARROGATE AND BACK.

THE 400 miles inter-team trial for the Service Cup arranged by the Herts County A.C. did not receive the support it has done on the two previous occasions on which the trial has been held. The start was from Barnet on Good Friday, and the route to Harrogate *via* Hatfield, Biggleswade by Stevenage, Norman Cross, Grantham, Newark, Doncaster, and Wetherby. Three clubs were represented, the Herts County, N.W. London, and North Middlesex. The score or so of competitors who started from Barnet at 7.30 a.m. made good progress. J. W. Thomas, the veteran rider of a Douglas, punctured on his way to the start, but, assisted by a fellow-member, he was able to start to time. A. J. Dreydell (Ivy sidecar) also experienced tyre trouble in a non-stop section, and continued on the rim, which was the commencement of a long list of troubles, which delayed him several hours. C. C. Cooke was caught in a trap at Stilton, two policemen who were in a ditch at the end of the measured distance starting the watch as they saw a motorist pass a spot 180 yards away. (This should be a case for the A.C.U.) Lunch was taken at Grantham and tea at Doncaster. Near the latter town the strong wind increased to the fury of a gale, raising clouds of dust. The following table shows the marks lost on the outward journey:

Miss Lottie Berend (O.K. Precision sidecar) restarting from Doncaster in the inter-team reliability trial to Harrogate.

No.	Name and Machine.	Biggleswade.	Grantham.	Doncaster.	Harrogate.	Total.
15	C. C. Cooke (Triumph)	N.S. 7	1	6	2	16
63	J. W. Thomas (Douglas)	N.S. 1	2	6	1	10
80	Miss Berend (O.K.)	5 marks 1	2	1	19	28
18	A. N. Gutteridge (Rudge) ..	N.S. 1		1	7	9
69	H. J. Pooley (Premier)	N.S. 3		1	1	5
84	D. H. Noble (Rover)	N.S.	1	2	5	8
19	A. J. Dixon (Zenith)	N.S.	3	0	4	7
71	E. D. Rose (Rudge)	N.S. 2		0	7	9
85	T. R. Williams (Triumph) ..	N.S. 3	1	4	10	18
74	C. Rose (P. and M.)	N.S.		0	5	5
87	H. Boocock (Enfield)	N.S. 2	2	1	10	15
29	E. A. Colliver (Zenith)	N.S. 3	1	1	2	7
75	A. J. Dreydell (Ivy-Precision)	No time 46	0		X	46
88	T. A. B. Brown (Tab-Jap) ..	5 marks 7		0	7	14
32	H. H. Huckle Elswick)	N.S. 2	4	0	2	8
76	A. E. Taylor (F.N.)	N.S. 1		X	X	100
35	C. Worssam (Precision)	5 marks 3		X	X	100
78	P. H. Goddard (Douglas) ..	N.S. 3		1	5	9

The following competitors survived the double journey:

C. C. Cooke (Triumph)
F. G. Thomas (Douglas)
Miss Berend (O.K. sc.)
A. H. Gutteridge (Rudge)
H. J. Pooley (Premier)
D. H. Noble (Rover)
A. J. Dixon (Zenith)
E. D. Rose (Rudge)
T. R. Williams (Triumph)
C. Rose (P. and M.)
H. Boocock (Enfield)
A. Dreydell (Ivy-Precision)
T. A. B. Brown (Tab-Jap)
H. H. Huckle (Elswick)
C. Worssam (Precision)

P. H. Goddard's Douglas seized eight miles from the finish, the rider pedalling the machine home.

E. A. Colliver (6 Zenith) retired at Silton with tyre troubles. The return journey proved a very hard ride owing to the high wind.

BIRMINGHAM TO PERTH AND BACK.

THE Birmingham M.C.C. run from Birmingham to Perth and back was started on Saturday morning last from the Parson and Clerk on the Old Chester Road. The morning was very dark, but quite fine, and of the twenty-one entrants nineteen started. G. H. Mansell (Singer and sidecar) was too late to start with the remainder of the competitors, but he followed to Perth.

Just before reaching Whitchurch, Rigby (New Hudson) ran into the hedge at a bad corner and was forced to retire. Passing through Whitchurch most of the competitors were stopped by the police, who examined the number plates. The roads were in fine trim except over Shap, where the surface was greasy.

After leaving Carlisle a terrible head wind sprang up, and over the moors near Abington most of the competitors were driving on low gear with the throttle wide open, and by lying along the top tube they just managed to keep going. The checker at the secret check between Carlisle and Beattock failed to appear. Cox (Forward) retired at Lanark through the magneto shaking loose. The competitors who arrived at Perth one minute either side of schedule time were Taylor (Veloce), Newey (Ariel), Rollason (Rudge), Duke (Zenith), Jones (Zenith), Sangster (Ariel), Seymour Smith (Norton), Steeley (Triumph), Busby (Twin Humber), Peck (Rudge), Ball (Triumph), Brook (water-cooled Precision), Backwell (Zenith), and Pollock (James).

At Perth the competitors stayed at the Royal George Hotel, where excellent accommodation was provided, and all arrangements were carried out by the Perth and District M.C.C., whose officials acted as checkers. The return journey was commenced at 3 a.m. on Monday.

Soon after leaving Perth it commenced to rain, and later on, when getting near Stirling, a gale sprang up and the machines could hardly move. Driving over the moors near Abington the gale caused it to be most dangerous as it tended to blow the machine over sideways.

Checking at the Racecourse Garage, Doncaster in the inter-club reliability trial for the Service Cup.

BRIGSTEER BROW HILL-CLIMB.

A LARGE ENTRY FOR THE WESTMORLAND CLUB'S EASTER MONDAY EVENT.

E. W. Cheshire (3½ Triumph) after successfully rounding the bend on Brigsteer Brow.

WITH a programme containing competitors' numbers up to 179, there was promise that the Westmorland Motor Cycle Club's second open hill-climb on Easter Monday would prove a most important event. It was not surprising, therefore, to find hundreds of spectators at the hill, which is situated four miles west of Kendal. Weighing operations took place at the public scales, Kendal, in the morning. No practising was permitted on the day of the contest, and a start was made with Class I. at noon. A telephone apparatus was installed on the hill, and altogether the arrangements were exceedingly good. Makers had been very liberal in the matter of prizes, which enabled the club to present first, second, and third awards in each class. The weather was rough and the sky overcast when racing commenced. The results are given hereunder:

Results of Nine Classes.

CLASS I.—Single-cylinder lightweights, 360 c.c., on formula.
1. F. W Barnes (2¾ Zenith) | 3. F. C. Jones (2½ Singer)
2. G. Cocker (2½ Singer).

CLASS II.—Single-cylinders, 480 c.c. to 580 c.c., touring machines only, on formula.
1. G. W. Braithwaite (3½ Zenith) | 3. B. Jefferys (3½ Triumph)
2. F. W. Barnes (3½ Zenith) | 4. Miss Ida Pickles (3½ Rudge)

Fastest time, S. Crawley (3½ Triumph).

F. W. Barnes (Zenith) starting in the Variable Gear Class—which he won—followed by C. Murdoch (Singer).

CLASS III.—Single-cylinders, any capacity, on time.
1. P. Weatherilt (3½ Zenith) | 4. W. F. Newsome (3½ Triumph)
2. R. Bowness (3½ Matchless)
3. G. Braithwaite (3½ Zenith)

CLASS IV.—Lightweight twins, 480 c.c., on formula.
1. S. W. Phillpott (2¾ Humber) | 3. H. L. Slingsby (2¾ Douglas)
2. A. H. Alexander (2¾ Douglas).

CLASS V.—Twin-cylinders, any capacity, on formula.
1. F. W. Barnes (6 Zenith) | 3. N. H. Brown (7 Indian)
2. J. R. Alexander (5 Indian)

CLASS VI.—Variably-geared machines, on formula.
1. G. W. Braithwaite (3½ Zenith) | 2. F. W. Barnes (3½ Zenith) | 3. A. J. Moffatt (3½ Zenith)

CLASS VII.—Any power with sidecar, on formula.
1. H. Dixon (3½ N. Hudson) | 3. R. P. Montgomery (3½ Rudge multi)
2. F. W. Barnes (6 Zenith)

CLASS VIII.—Any capacity machine, on time.
1. F. W. Barnes (8 Zenith) | 3. A. J. Moorhouse (7 Indian)
2. A. Alexander (7 Indian)

CLASS IX.—Novice class.
1. G. Steele (7 Indian) | 2. E. F. Baxter (6 Rex)

R. P. Montgomery (3½ Rudge and sidecar) rounding the second bend.

CLUB NEWS.

Motor Cycle Union of Ireland (Ulster Centre).

The opening reliability run of this centre was held on the 6th inst., the course being from Belfast to Londonderry. The event was down for decision on the previous week-end, but was postponed, and the change had a beneficial result on the entry. The roads were in fairly good condition, and the weather exceptionally fine. Four open controls and several secret checks were established *en route*, whilst in addition observers were stationed on one of the hills on the road between Coleraine and Limavady.

The result was as follows: 1, J. Stewart (2¾ h.p. Douglas); 2, J. R. Thompson (3½ h.p. T.T. B.S.A.); 3, J. Lavery (3½ h.p. Ariel); 4, C. R. Martin (3½ h.p. Triumph).

Manchester M.C.

A one-day reliability trial to North Wales was successfully carried through in connection with the annual Easter tour. It took the form of a non-stop run from Manchester to Beddgelert, and the time allowed (including one and a half hours for lunch) was six hours and forty and a half minutes, which made the average speed twenty miles per hour. Competitors were checked outside Beddgelert, the competitor losing the least number of marks and passing the check in the nearest time to the schedule to be the winner. The route lay by the way of Chester, Mold, Ruthin to Cerrig-y-Druidion (lunch), then to Bettws-y-Coed, Capel Curig, Pen-y-gwryd to Beddgelert, 103½ miles. The weather conditions were anything but perfect, a strong gale facing the competitors all the way. W. Heaton (2½ A.J.S.) proved to be the winner, beating J. Tytler by one minute and forty seconds.

Cumberland County M.C.C.

The opening hill-climb took place on the 5th inst. The hill chosen this year was Underwood hill, Watermillock, on a by-road leading from the road along the side of Ullswater Lake from Pooley Bridge to Patterdale and contains three almost right angular corners. Despite the unfavourable conditions, the following riders did well: G. W. Braithwaite (Zenith), R. Bownass (Matchless), W. B. Little (Rudge), L. L. Pierce (Rudge), P. E. Tolfree (Matchless), W. M. Milburn (Triumph), H. B. Harrison (Rudge), E. Jeffrys (Indian), and E. Somervill (Indian).

The results, which were decided on formula, were as follows:

SINGLES (any capacity).

	Rider and machine.	Time.	Fig. of merit.
1.	Geo. W. Braithwaite (3½ Zenith) ...	57s.	74.1
2.	R. Bowness (3½ Matchless) ...	53⅕s.	81.6
3.	W. B. Little (3½ Rudge)	64s.	84.4

TWINS (any capacity).

1.	E. Jefferys (5 Indian)	65⅕s.	106.5
2.	R. Drinkall (2¾ Douglas)	103⅕s.	102.3
3.	A. Somervell (7 Indian)	56s.	139.1

Fastest time: R. Bowness (3½ h.p. Matchless), 53⅕ secs.

Belfast and District M.C.

This club held a most important open hill-climbing competition on Knocksaughey Hill, near Giant's Causeway. The distance of the climb was about 1,550 yards, the gradient averaging 1 in 10. The surface was good, excepting a patch at the final bend. The event was decided to the accompaniment of a furious hurricane, which prevented several from starting. Thirty-four entries were received. The A.C.U. formula was used. Results:

CLASS I.—Not exceeding 500 c.c.

		Fig. of merit.
1.	R. Holloway (3½ Premier)	76.81
2.	James Stewart (2¾ Douglas)	81.9
3.	W. Cameron	83.76

CLASS II.—Unlimited capacity.

		Time.
1.	R. Holloway (3½ Premier)	52⅘s.
2.	J. Thompson (3½ B.S.A.)	53s.
3.	S. Corry (3½ Matchless)	55⅘s.

Holloway's time equals about 61 m.p.h., and is partly accounted for by the favouring gale.

Great interest was taken in the contests by Belfast and Ballymena motorists.

Cork M.C.C.

The open hill-climb took place at Grange Hill Ovens on the 5th inst. Results:

CLASS A.—Under 500 c.c.

		Time.	Fig. of merit.
E.	Harrington (2 h.p. Humber) ...	75s.	... 64
J.	T. O'Callaghan (2 h.p. Humber)...	86s.	... 65
R.	S. Russell (Matchless)	46s.	... 71

CLASS B.—Over 500 c.c.

L.	Dobbin (8 h.p. Matchless) ...	43.6s.	... 106
M.	J. Fitzgerald (6 h.p. Zenith) ...	68.6s.	... 127

Cardiff M.C.

A large number of members met on Good Friday morning at the City Hall (by kind permission of the Lord Mayor) for the opening meet. The weather was, however, dull, and fine rain fell at intervals. A group photograph was taken, after which the members proceeded to Speech House, Forest of Dean, where, after lunch, an impromptu hill-climb was held, with the following results:

CLASS 1.—Motor cycles, any capacity, run on handicap, entrants being paired.

1. A. B. Wade (6 h.p. Zenith).
2. J. C. Moore (3½ h.p. Rudge).

CLASS 2.—Motor cycles, any capacity, with sidecar attachments, run on handicap, entrants being paired.

1. E. Chapman (6 h.p. Zenith).

Torbay and District M.C.C.

The club held a hill-climb near Ashburton on the 5th inst. in splendid weather on a hill two-thirds of a mile long. A strong head wind blowing down the course increased the difficulty of negotiating it, and several machines failed to get up. Hardy's Norton made fastest time in good style, Williamson's Norton of 490 c.c. being only one second slower, and the latter rider being a heavier man makes his run up an excellent one. The climb was run off in three divisions—the first open to all for first on time and formula, the second for those members who had not previously taken prizes, the third lightweights, and an "old crocks" event, which, however, attracted only one entrant—a Quadrant, yclept the "Roebuck"—which got to the top well. Of the lightweights Powell's 2¾ h.p. Enfield was first, making very good time. Results:

	Rider and machine.	Time.
1.	A. C. Hardy (3½ Norton)	57⅖s.
2.	— Williamson (3½ Norton)	58⅖s.
3.	W. Harding (6 Zenith)	1m. 2⅖s.
4.	H. Benny (3½ Rudge)	1m. 7⅖s.
5.	R. Broadbear (3½ Premier)	1m. 8⅖s.
6.	A. Powell (2¾ Enfield)	1m. 16⅖s.

Scene at the start of the Doncaster and District M.C.C. speed judging competition.

Club News.—

H. D. Shaw making his debut on his new 8 h.p. twin Zenith at the Bradford M.C.C. minor hill-climb at Tong. The J.A.P. engine is of the overhead valve type.

Bradford M.C.C.

The club opened its season's programme with a handicap hill-climb at Tong. The surface was treacherous, but some good riding was witnessed. H. D. Shaw (8 Zenith) proved the winner by 0⅘sec. from T. H. Dunston (T.T. Rudge), after a keen struggle. Percy Shaw (T.T. P. and M.) and H. B. Ault (T.T. Triumph) rode well. Result: 1, H. D. Shaw (8 Zenith); 2, T. H. Dunstan (T.T. Rudge); 3, F. Hodgson (Bradbury sc.); 4, H. B. Ault (T.T. Triumph). The annual open hill-climb is fixed for May 18th, and a two days' open reliability trial, Bradford to Edinburgh and back, for Whit Monday and Tuesday.

The Motor Cycling Club.

Copies of the flashlight photograph taken at the opening run dinner at Brighton can be obtained from Mr. B. Mariane, 4, Percy Street, Tottenham Court Road, W., for 2s. each.

Taunton and District M.C.C.

The opening run of this club took place on the 28th ult. to Burnham, when over forty members turned up and a most enjoyable afternoon was spent. The club now numbers just over sixty, and it is hoped this number will be increased to a hundred before the end of the season. Great local interest is being taken in the open hill-climb to be held on Cothelstone Hill on Thursday, May 16th, full particulars of which can be obtained from the hon. secretary, Mr. W. G. Potter, 41, Belvedere Road, Taunton.

Dublin and District M.C.C.

There will be race meetings at Portmarnock on the 13th and 27th inst.; on each day there will be three events.

Flying half-mile competitions will take place on the 25th inst. and the 22nd prox., early in the morning, on a level road.

An open reliability trial will be held on May 4th. Starting from Donnybrook at 2.30 p.m., the route will be *via* Ashford, Laragh, Drumgoff, Aughrim, Ovoca, and Rathdrum. Observers will be stationed on Ballymacroe Hill.

Bristol M.C.C.

A very interesting and instructive lecture was given by Professor W. Morgan, of the Bristol University, before the members of the Bristol Motor Cycle Club on Thursday evening, the 28th ult., at the club's headquarters, relative to valve setting.

The club held its spring competition on the 30th ult., starting at Keynsham and covering a circular course twice. The run was a non-stop, and the result was. 1, F. Davis (3½ Rudge); 2, W. T. Symes (2¾ Douglas); 3, E. Kickham (2¾ Douglas).

Entries for the open hill-climb close on Monday next, the 15th inst., to Mr P. Grout, Warmley, Bristol. There are ten classes

Sheffield and Hallamshire M.C.C.

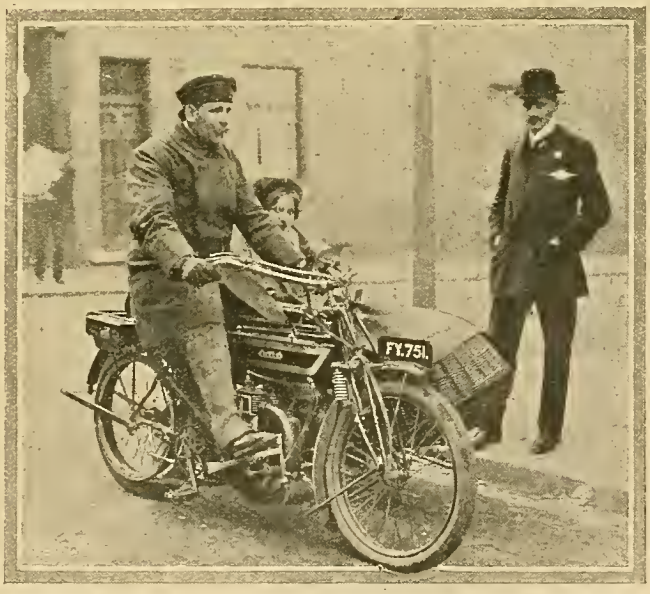
The opening run took place on the 30th ult., on a circular course in Derbyshire. The attendance was good.

Coventry and Warwickshire M.C.

Entries for the members' sidecar trial to be held on Saturday next, the 13th inst., close first post to-day to the hon. sec., Mr. G. Smith, 19, Hertford Street, Coventry. The course must be covered without a stop and includes six ascents of Edge Hill, which will ensure a sporting contest.

Wolverhampton M.C.C.

On the 27th and 28th inst., a two-day reliability trial for the Stevens Cup and medals will be held. This will be over a secret course, which will be made known at headquarters on Friday evening, the 26th inst.



The committee have also arranged for a lecture on "Magnetos," by Mr. Bennett, of the Bosch Magneto Co., Ltd., in the Lecture Hall, Garrick Street, Wolverhampton, on Monday, the 22nd inst. All motorists in Wolverhampton and district will be most welcome. Admission free by ticket, to be obtained of the hon. secretary, George Hill, Temple Road, Willenhall.

The following runs have been fixed for April: 13th, Buxton; 20th, Hereford; 27th and 28th, Stevens Cup reliability trial (secret course).

Will the present hon. secretaries of the following clubs send their names and addresses to the Editor: Amman Valley and District M.C., Halifax and District M.C.C., Hull (Kingston) M.C., Irish Motor Cycle Union (Ulster Centre), Oxfordshire A.C., and Pontefract M.C.

100 Miles per Day on a Sidecar.

Last week we had the pleasure of meeting Harry Long and Miss Long, who have just started on another long-distance record-breaking ride. This time, Mr. Long is riding a 4 h.p. Singer, with Singer two-speed gear and Millford sidecar. His intention was to spend Easter in Wales, and then journey from Land's End to John-o'-Groat's (possibly more than once), touching on the way

Harry Long, who has commenced an attempt to cover 100 miles per day by sidecar.

most important Midland towns, after which he will repeat last year's coast route trip. All the while his object is to cover one hundred miles per day.

Mr. Long is very hopeful, and confident of success. He told us the old tale of doubting Thomases, who describe the coast trip with a sidecar as impossible. We left him going out to finish his daily hundred miles in a very cheerful frame of mind. We wish him all good luck and a successful accomplishment of his plucky venture.

Questions & Replies

A selection of questions of general interest received from readers and our replies thereto. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal queries should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Ignition Control.

I have a 2 h.p. Humber motor cycle with fixed point magneto ignition. (1.) Should I gain any material advantage by fitting a spark control? (2.) What alterations to magneto would be necessary in fitting control?—M.R.E.

(1.) Yes, you would find considerable advantage by fitting a spark control. This would give the engine greater flexibility and prevent knocking if it be used intelligently. (2.) All that would be needed, probably, is a new contact breaker cover.

Baldock (Herts) to Llandudno and Back.

Please give me the best route from Baldock, Herts, to Llandudno, avoiding hills as much as possible and also traffic in towns, with an alternative route home —B.F.

Your best route would be as follows: Baldock, Shefford, Bedford, Northampton, West Haddon, Crick, then straight up Watling Street, following the signposts of the R.A.C. to Wellington; go through Wellington, Shrewsbury, and follow the Holyhead Road through Llangollen to Bettws-y-Coed; here turn right, and go through Llanrwst to Llandudno. You might return *viâ* the coast road through Abergele, Rhyl, Flint, Chester, Tarporley, Nantwich, Stone, Rugeley, Lichfield, and join Watling Street near Weeford a few miles further on.

Long Distances on a Lightweight.

(1.) I purpose riding my 2¾ h.p. twin Enfield from Ashby-de-la-Zouch to Cromer. Please tell me the most direct route (avoiding, if possible, the biggest hills) and distance. (2.) Do you consider I should get so far on such a small machine? (3.) Would it be wise to average twenty-five miles per hour, I mean on account of the low power of the machine?—T.L.D.

(1.) Your best route would be as follows: Ashby, Loughborough, Melton Mowbray, Oakham, Stamford, Peterborough, Wisbech, King's Lynn, Fakenham, Holt, to Cromer. The distance is approximately 144 miles. (2.) There will be no difficulty in travelling this distance in a day. We have ridden from near Gloucester to Newquay (Cornwall) on a similar machine, and the Devonshire hills are far more severe than any you will meet. (3.) The machine is easily capable of averaging 25 m.p.h or more, but we recommend you to average 20 m.p.h.

Exeter to Walthamstow.

Please tell me the best route to London, avoiding the larger towns if possible: also how to get through London to Hoe Street, Walthamstow? I think I had better time myself to reach the outskirts of London early in the evening, and then wait until about 1 a.m., and slip through the City when the streets are clear? Do you think this a good plan? I live eight miles below Exeter, and, supposing I left here at 7 a.m., could I, with good going and ordinary luck (averaging 15 to 20 m.p.h.), get to the outskirts of London the same day? I want to go up to London in a month's time, and if you can advise me on the above points I shall be very grateful. I am only a motorist of a few years' standing, and so do not know much of the roads outside Devon. My machine is a 1911 two-speed Humber.—C.W.M.

Your best route would be as follows: Exeter, Honiton, Chard, Crewkerne, Yeovil, Shaftesbury, Wilton, Salisbury, Andover, Whitchurch, Basingstoke, Hook, Hartley Row, Bagshot, Staines, and Hounslow. The best way to proceed would then be: At the entrance of Hounslow turn left just where the Bath Road joins the Exeter Road, and go through Heston Hounslow, Heston St. Leonards, skirt Osterley Park, cross the main Oxford Road under the railway bridge (dangerous crossing), turn first left and then right at Greenford, and go straight on to Harrow-on-the-Hill. Here turn right, and go straight on until you reach Edgware Road, cross straight over this, and go through Hendon St. Mary to Finchley Station. Here ask your way to Muswell Hill, where, close by Muswell Hill Station, you will find a road which will take you direct through Tottenham High Cross to Walthamstow. At Blackwash Road Station anyone will tell you the way to Hoe Street. The route we have given you avoids as much of the traffic as possible, but it takes you right round London. This route is best seen on Bacon's Map of Twenty Miles Round London (which can be obtained from these offices post free, 1s. 2d.). If you leave Exeter at 7 a.m. you should be able to reach London the same evening. It would be worth your while getting the map we mention and studying the route round; you might find this more convenient than waiting till 1 a.m. From Starcross to the outskirts of London is approximately 175 miles.

RACING IN PAIRS AT OAKAMOOR.

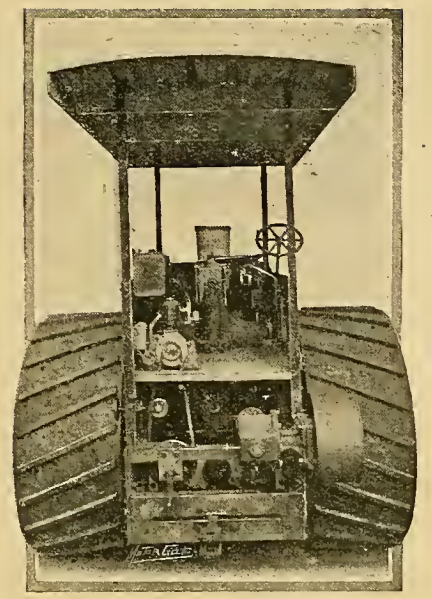
W. E. Cook, on an A.S.L., appears to be taking matters very easily. He was eventually put out by a mysterious stoppage, his engine restarting immediately.

Oil-tight Joints.

What is the best stuff to use for making oil-tight joints in a base chamber on a motor cycle when any sort of paper is too thick? Also, what is the best stuff to use to make oil joint between cylinder and cylinder head and between cylinder and crank case (old M.M.C. engine)?—R.W.

Oil-tight joints in both the places mentioned may be well made by means of Coverol, made by Conrad Schmidt and Co., and sold by the Service Co., Ltd.

Removing Contact Breaker.



I was just going to write to you on the subject of "A.J.W.'s" question, which you answer in *The Motor Cycle* of February 15th. My rocking arm also has stuck owing to the damp. As I am nervous about tampering with my magneto, will you kindly supplement your reply to "A.J.W." by answering these questions: (1.) Cannot the rocking arm be removed without removing the whole contact breaker and nut in the centre? (2.) Does the contact breaker include the rocking arm, and will that be removed with the contact breaker? (3.) Is there any difficulty in replacing the contact breaker in the right position? (4.) Does the rocking arm turn on a fibre pin? If so, is there any danger of breaking it? (5.) My rocking arm appears to be kept in place merely by a spring. Is this so? The magneto is a Bosch.—A.C.R.

(1.) Yes. The rocking arm can be removed without removing the whole contact breaker by simply pushing the spring to one side and unscrewing the spring which controls it. (2.) It does. To take off the whole contact breaker, remove the centre nut, then taking two screwdrivers and placing them behind the contact breaker plate at opposite sides, gently lever this out. It will come away without difficulty. (3.) There is a small projection on the contact breaker plate extension which ensures the latter always going back in the right position, so that it cannot possibly be put back wrongly. (4.) There is no danger of breaking the pin on which the rocking arm moves if care be used, as it is steel not fibre; the latter material is used for the bush. (5.) Yes.

Sparking at Contact Breaker.

(1.) I have a 1909 Triumph, and, on removing the cap of the magneto, I found that it sparks at the points of the contact breaker. Is this serious, and does it in any way affect the running of the machine? If so, how can it be remedied? (2.) I also find that oil leaks between the cylinder and the crank case, so that the latter gets covered with this black, gritty slime, making it very difficult to clean. What is the best method of cleaning the crank case, valves, etc., when in this condition?. (3.) What is the most suitable washer to have between the cylinder and crank case? (4.) What is the best route from Andover to Leeds for above machine?—W.R.V.W.

(1.) When you remove the contact breaker cap from this particular type of magneto, you interrupt the condenser connections, consequently you see a fairly violent spark at the contact breaker. It does not affect the running of the machine, except that it burns up the platinum points. (2.) Wash the crank case down with a stiff brush soaked in petrol. (3.) Brown paper soaked in boiled linseed oil is the best washer. (4.) Your best route would be as follows: Andover, Newbury, Abingdon, Oxford, Bicester, Buckingham, Towcester, Northampton, Kettering, Oakham, then on to the Great North Road, and through Colsterworth, Grantham, Newark, Tuxford, Retford, Doncaster to Leeds.

3½ H.P. TO START 120 H.P.

The Daimler Agricultural Tractor, designed for drawing a 25 disc plough for Canada, is fitted with a six-cylinder engine of 150 mm. bore and equal stroke. To start this 120 h.p. engine, use has been made of a separate 3½ h.p. B.S.A. motor cycle engine. The engine is started in the usual way, and by means of a clutch the power is utilised to drive a shaft, which in turn starts the big engine by means of a friction wheel on the end of the small shaft pressing against the big flywheel.

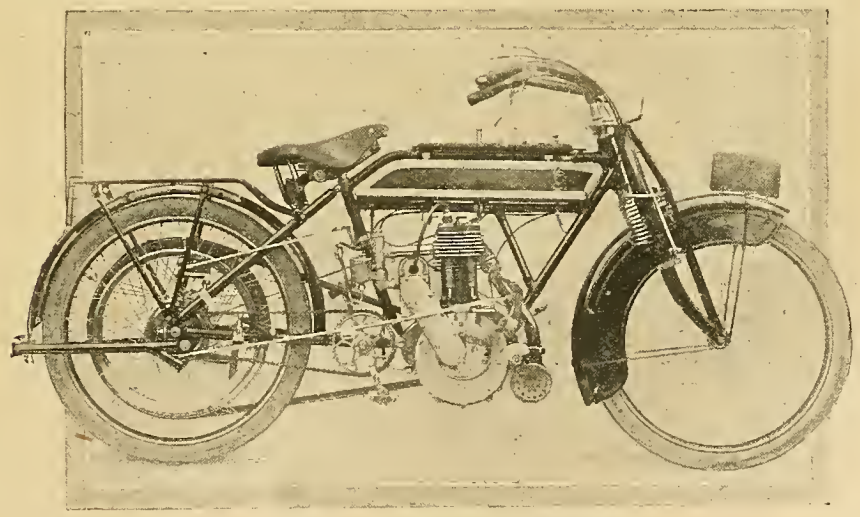
Leeds to Folkestone.

Please inform me which is the best and most direct route from Leeds to Folkestone *via* Shepherd's Bush, London, giving principal towns, also mileage. —H.R.M.

Your best route would be as follows: Leeds, Doncaster, straight down the Great North Road through Retford, Newark, Grantham, Stamford, Stilton, Eaton Socon, Biggleswade, Baldock, Stevenage, Regent's Park, down Lancaster Gate to Shepherd's Bush. From here cross over Wandsworth Bridge, and when over the river turn right, and then immediately after the railway bridge, ascending a steep hill, go straight on and bear to your left till you see Wandsworth Common. Turn to your right and follow the Trinity Road right to Tooting; here ask your way to Mitcham, and follow the road through Mitcham, Croydon, West Wickham, Farnborough, Riverhead (left), Wrotham, Maidstone, Ashford, Hythe, Folkestone. The distance is approximately 270 miles. We should not advise you to go by Shepherd's Bush if you can help it. It would be better to avoid London, and go through Stevenage, Hertford, Ware, Harlow, Ongar, Brentwood, Tilbury, Gravesend, to Wrotham.

EXPERIENCES WANTED.

Readers desirous of obtaining the experiences of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries below should be addressed c/o The Editor.



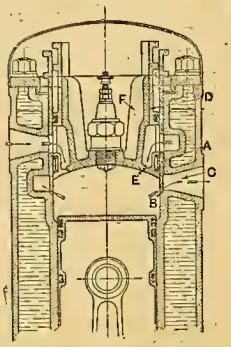
"P.A.L." (Chatham).—Mabon variable gear.

"G.S.W." (Battersea Park).—Bedelia cyclecar.

"W.A.E." (Weston-super-Mare).—Mabon, Zenith-Gradua, and N.S.U. gears, all with 1911 free engine Triumph, with and without sidecar.

"T.B." (Durham).—B. and B., Lukin, and Binks carburetters; also Bowden counter-shaft gear for 3½ h.p. machine.

"Y 899" (Sandford).—A.C. sociable.



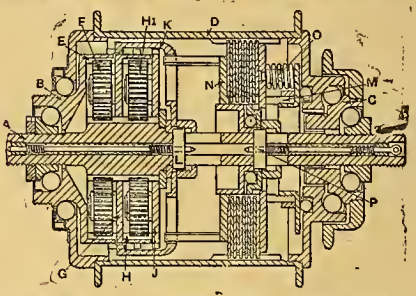
NEW MODEL WULFRUNA MOTOR CYCLE.

This machine is fitted with an Arno engine and Thoroton two-speed gear. Other fittings used include Druid forks, Lycett saddle, Hutchinson tyres, and Bosch magneto carried at rear of engine.

A Highly Efficient Valve System.

One of the chief objections to using mushroom valves of large diameter is due to the big resistance offered to the exhaust valve when opening, as it lifts against the pressure existing in the cylinder which may be 50 lbs. or more per square inch. In this construction the valves are of considerable port opening. The exhaust valve takes the form of a sleeve A which seats at B, and when raised allows the gas to pass through the outlet C. It will be seen that the exhaust valve is not held on its seat by the pressure in the cylinder, so requires practically no effort to raise it. The inlet valve takes the form of a sleeve D with packing rings interposed between it and the exhaust valve sleeve A. The inlet valve sleeve has a conical seating at E on the cylinder head F. The whole of the combustion chamber is machined.—A. W. Reeves, No. 41, 1912.

Sturmey-Archer Three-speed Hub.



This is a construction of three-speed hub gear having a direct drive on top speed, and incorporating a plate clutch.

PATENTS

BY

ERIC W WALFORD. F.C.I.P.A.

Upon the usual fixed spindle A are mounted driving members B C, the former receiving motion from the engine, and the latter having a free wheel connection with the hub shell D, which is mounted upon ball bearings on the members B C. The driving member B is flanged over to form an internally toothed ring E, engaging planet pinions F, which revolve on studs on a carrier G. This carrier G, like the member B, is also flanged to form an internally toothed ring H, which engages planet pinions H^1 on a second carrier J. Both trains of planet pinions engage a sun pinion fixed on the spindle A. The outer peripheries of the driving member B and planet pinion carriers H and J are formed with clutch teeth engaging corresponding teeth on a clutch ring K free to slide on the spindle A, and engaged at its boss by an operating key and rod L. At the other end of the hub is arranged a plate clutch comprising a sleeve M and a disc N, the latter having a sliding connection with the clutch ring K, which provides a positive drive, but allows of the necessary movement of the clutch ring K for operation of the gears. With the sleeve M and disc N co-operate friction plates, alternately engaging the sleeve M and the hub shell, the plates being normally pressed into engagement by springs O, but being capable of disengagement by the operation of a draw-rod and key device P. In operation, assuming the plate clutch to be in engagement, when the clutch teeth on the driving member E are in engagement with the clutch ring K the drive is "direct" to the hub shell *via* the plate clutch. If now the clutch ring be moved to release the member A and engage the planet pinion carrier G, the drive is from

the member A through the planet pinions F to the carrier G, and so to the hub shell. When the clutch ring engages the carrier J, both sets of planet pinions F are in operation and a doubly reduced speed is transmitted. The provision of the pedalling sprocket C enables the hub to be rotated to start the engine.—Sturmey-Archer Gears, Ltd., and J. Cohen, No. 2,013, 1911.

Motor Cycle Thefts.

Owing to the number of thefts of motor cycles from various London depots, Messrs. R. G. Nye and Co., Hampstead Road, Tottenham Court Road, have been enterprising enough to insure clients' machines entrusted to their care against both fire and burglary.

Insurance.

Under the new A.C.U. insurance scheme full particulars of which can be obtained from the A.C.U. Insurance Department, 199, Piccadilly, W., damage to lamps is included without extra charge in the motor bicycle premium, and also sidecars without extra charge, provided the full value of the combination be insured.

Preventing Rust.

The Bancroftian Co., Bishopsgate Street, E.C., have introduced a new lacquer for preserving plated and other bright parts from rust. To apply it the part is first polished, then rubbed over with cotton wool soaked in methylated spirit, and afterwards the lacquer is applied with the same piece of wool. From samples we have seen, the preparation appears to be quite successful.

"The Autocars of 1912."

The above title is that of a new book which has just been published by Iliffe and Sons, Ltd., 20, Tudor Street, E.C., price 1s. 6d. net, or 1s. 9d. post free. In it is an alphabetically arranged table of cars on the British market; also drawings of their bonnets and radiators. Motor cyclists who are keen on picking out and recognising the various makes of cars they meet on the road will be interested to examine these drawings of distinctive bonnets and radiators with which the book is illustrated

SPARKLETS

Upkeep and Management.

Quite a good little booklet on the management of the Rover motor bicycle is that entitled "Instructions for the Upkeep and Management." It is full of lucid illustrations and well-written reading matter, and is quite one of the best books of the kind we have seen.

For the Good of the Cause.

The Hendee Manufacturing Co., 178, Great Portland Street, W., have had some special notices printed on cards which will be sent to any *bonâ fide* motor cycle agent on receipt of 3d. to cover the cost of production and postage. The notice reads.

"Do not run your machine on the stand longer than 30 secs. at one time.

Never run it at full speed on the stand at any time.

No air-cooled motor ever built will stand such treatment. It burns out rings and injures bearings.

More motors have been ruined on the stand than on the road."

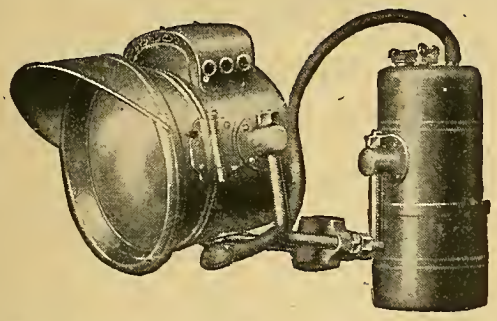
The advice is excellent, and one of the cards should be prominently placed in every garage. The card bears no name or advertising matter in connection with the Hendee Co or the Indian machines, so that the distribution of the cards can be said to be a disinterested action

Folding Clothes Brush.

The sale of the neat and handy folding clothes brush which we illustrated in the issue of January 4th, page 20, has been taken up by Brown Bros., Ltd., Newman Street, Oxford Street, W., who are retailing it at a very moderate figure.

A New Tyre.

The Liga Rubber Works, Frankfurt a/M., whose London business is controlled by Mr. Clifford Wilson, have just introduced a new tyre, to be known as the "Ligatire." The tyre cover is black in colour and built up on Tripolitan fabric, woven in such a manner that even when the tyre is board hard its resiliency is said to be unimpaired.



Tyre Sizes.

J. Pedley and Son, Ltd., Oxford Works, Great Charles Street, Birmingham, inform us that they are now able to supply a 26in. × 2½in. cover which will fit a 2¼in. rim; also a 26in. × 2¼in. cover to fit 2¼in. rims. Readers who are interested can obtain sections of the tyre covers mentioned from the above address.

Catalogues Received.

The Corah models for 1912 are the touring model 3½ or 4½ h.p. and the T.T. model with overhead valve engine; the last-named is also made with a side-valve engine if desired. Catalogues of these machines can be obtained from the Corah Motor Manufacturing Co., King's Norton, Birmingham.

We are in receipt of a leaflet from Messrs. Edmund Wadden and Co., The Quadrant, Weybridge, Surrey, descriptive of the Autotrix cyclecar, a racy looking little vehicle with low-built seats, sloping bonnet, and wheel steering.

Buy this Lamp —in preference.

BECAUSE IT IS THE WELL-KNOWN

Powell & Hanmer Motor Cycle Lamp

—the make with the biggest "QUALITY" reputation—the biggest sale—and the biggest benefits for users.

"MARTIN-JAP" MOTOR CYCLES

for SPEED and RELIABILITY.

Arrangements have now been completed whereby prompt delivery of these world-famous machines can be given. There is not sufficient space in this advertisement to detail the various records, etc., standing to the credit of these motor cycles—indeed, it is scarcely necessary, as the name of Harry Martin is world-famous. Enough if we state that over **250 Firsts** and over **200 World's Records** have been secured by the Martin-Jap.

AN IMPORTANT POINT.

Every machine is tested and personally supervised during construction by Mr. Harry Martin, **and no machine will leave the works until it has perfectly fulfilled the stringent test to which it will be subjected.** That the Martin-Jap is the most efficient machine made is no idle boast. This is proved by the consistent Record of Successes in all Open Competitions. In 1911 the Martin-Jap competed in **20 Races,** winning **17 Firsts, 2 Seconds.** Also **10 World's Records** were made, and are still standing, no other machine in the world being able to beat them despite repeated efforts.

"BURNETT"

PATENT SUCTION-CUP

TYRE.

TESTIMONIAL.

Colliery Inn, Brandon Colliery, Co. Durham,
March 6th, 1912.

Dear Sirs,

I have great pleasure in saying that the BURNETT Suction Motor Cycle Tyres have turned out most satisfactory in use.

I am particularly pleased with their excellent wearing qualities, and further, I find them to be good Non-Skids.

I travelled for my holidays with Pillion passenger, and luggage making a total weight of 30 stones on back cover, without machine, doing 550 miles in four days, over some of the roughest road in Scotland, without the slightest trouble.

I am a satisfied user of Burnett Covers, and intend using no other.

Believe me to be, yours truly,
(Signed), CHAS. F. CHRISTON.

Tel.: 33, Melksham. Tel. Address: "VACUUM, MELKSHAM."

Be Independent

of collier strikes, railway strikes, and industrial upheavals generally. You can do this if you BUY A MOTOR CYCLE. We are wanting to sell some. Please note.

Whether you are a man with little money or much money we can still find you a machine. If you have PLENTY OF MONEY, we shall be pleased to have your order for any of the high-class machines on the market. We are agents for them all. If you are a man with a settled income, and do not feel interested in paying the whole amount down, you will find us prepared to accommodate you on the deferred payment system. If you are a Sunny Jim with a wage, and can pay from £3 down and from 5/- per week, you can have a motor cycle. We can do everything for everybody, excepting those interesting innocents who write to ask if they can have a motor cycle for 5/- down. We would draw their attention to the fact that we are not selling gramaphones, push cycles, or watches; 5/- down is no use to us. We must have at least £3 down and the remainder as we might arrange.

You will find us always perfectly straightforward. We do not tell you one "fairy tale" and mean another. Probably we lose a lot of business through our straightforward, blunt way of dealing. However, we cannot help that, knowing that we gain a lot we should not otherwise get, and the man who wants all is likely to get little. WE are out to get as much as we can, and believe in the principle of giving and taking.

Probably some of you will think our advertising is rot. Neither do we worry about that, so long as you read it, and we feel quite sure that everybody who buys "The Motor Cycle" does read it, even if it is only to see what that silly kid Hitchen has to say this week. The trade all read it to see what ideas they can pick up. We do not mind this in the least, and would take this opportunity of saying that we shall be pleased to have the traders' orders for any machines they want to buy. We are the largest contractors in the world, and are not troubled with trade jealousy, but respectfully solicit their orders for any motor cycles they are wanting. Being, as we are, large buyers, we can treat them well, and better than other people, and, what is more to the point, we can give prompt delivery of the machines, where, of course, our contracts do not probibit.

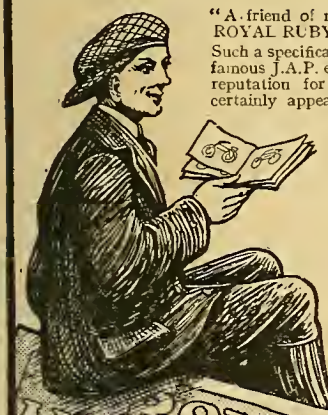
We are out on the jump, and have been "on" for some time. The fact that we are able to purchase from the makers £50,000 worth of motor cycles should prove conclusively that Hitchen's have confidence in themselves, and that they have created such a trade that they feel quite sure they will dispose of these machines, and, long before the season is over, be live Oliver Twist, "asking for more."

At the present moment we are buying from traders what we want, and with the same willingness we sell to them. If you are in the trade, and have Scotts, P. and M., Triumph, Matchless (No. 7 model), Jap-Bat (chain drive model), Douglas (any model), Clyno, or Morgan Runabouts, we shall be pleased to purchase from you. Cash down. No waiting. Money always ready. You need not pay any carriage. We will take them from the works. When you write us, state what you want net cash, and we will wire at once, accepting or declining.

By the by, it is almost time you wanted something in the way of tyres, belts, and accessories If so, you cannot do better than get on the jump with us. We are clearing out of the accessory trade, and are wanting your assistance in this direction. We can supply anything you may want AT A RIGHT PRICE; and if you have not had a list, it is time you had one; a halfpenny stamp will do the trick, and you will have one through by return post. Let us have your enquiries without delay. We are wanting to shift an enormous amount of stuff, so that we shall be in a position to deal with the heavy consignments of new machines which will be coming in each week. As the season advances our commitments increase, and we are very short of room to begin with.

We have an enormous amount of second-hand tackle which we should like you to come to see. This applies to both motor cycles and accessories, and we feel quite sure it will be worth the railway fare to see the stuff. The bargains you will get will more than compensate you for the fare paid. We are really determined on shifting it. Necessity is the mother of invention. We have no other place in which to put our new machines, therefore there is nothing else but to shift the old. If you are a cash buyer YOU CAN TAKE FROM 10% to 15% OFF OUR LIST PRICE for second-hand motor cycles. All we ask is that you make us a reasonable offer, and you will get a bike.

Believe us, we are not talking through our hat, but intend to shift the lot between now and the end of April. It is the time of the year when "the b'hoys" want motor cycles, and we are making this exceptional offer to clear them out. If you come with some money in your pocket, and you cannot buy a motor cycle, then you do not want one, as if you show the least sign of buying, we will guarantee to sell you one. We have no objection to doing trade with you in any way which will suit you best, and shall be glad to have a visit or a line from you.



Before closing we will enumerate some of the machines we have in stock and have coming in: Phelon and Moore's, Scott, Jap-Bat (chain drive and belt drive), single and 2-speed gear; Matchless, all numbers of 2-speed gear models; Clyno, Douglas, Zenith, Bradbury, 2-speed gear, belt drive (chain drive by and by); Premier, single and 2-speed gear, lightweight 3-speed gear; Humber, 3½ h.p. 2-speed, lightweight 3-speed; Lincoln Elk, single and 2-speed; Motosacoche, 2-speed gear; Triumph, ordinary and free engine; A.C. tricar, and Morgan runabout. Many of these you can have on the nod, and any you can have for cash. Remember, the great thing in motor cycle dealing to-day is delivery. It is no use your hanging about for weeks for the sake of a shilling or two discount, and losing the season. We can do as well as anybody in the way of discount, and better than anybody in delivery. Remember these things. We have practically nothing booked up, and are ready for your orders any time. We do not appreciate the system of booking up, preferring to be able to say, WE HAVE THE STUFF, READY FOR SELLING.

Come and see the canaries. Note Address:

Hitchen's, Ltd., Morecambe.

'Phone: 112 Wires: "Motor, Morecambe."

"I'm glad I got it"

"A friend of mine told me to write for the ROYAL RUBY catalogue and I'm glad I got it. Such a specification as yours combined with the famous J.A.P. engine, and the ROYAL RUBY reputation for first-class workmanship, must certainly appeal to the most fastidious motor cyclist."

GET THE CATALOGUE TO-DAY.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 14 words or less 1/6, and 1d. per word after. Each paragraph is charged separately. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor Street, E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should state distinctly under what heading and in what issue the announcement appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

CLASSIFICATION BY LOCALITY.

For the convenience of purchasers of second-hand motor cycles, the advertisements are classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Plan showing division of England into Sections.

SECTION I.
Northumberland, Cumberland, Durham, and Westmoreland.

SECTION II.
York and Lancashire.

SECTION III.
Carnarvon, Denbigh, Flint, Cheshire, Derby, Stafford, Shropshire, Montgomery, and Merioneth.

NEW MOTOR CYCLES IN EXCHANGE FOR USED ONES. SQUARE DEALS ALWAYS.

WAUCHOPE'S,
9, SHOE LANE, FLEET STREET, LONDON, E.C.
Wires: Opificer, London. 'Phone: Holborn 5777.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

TEE BEE LOW SEAT-PILLAR, 5/- each.

GREAT CLEARANCE LINE.

New Dunlops, 28 × 2 and 2¼, wired edges	10/6
26 × 2¼in. Genuine Hutchinson Tubes	6/11
2¼ × 2 and 2¼ Beaded Clipper Covers, new	8/6
Best Quality Butt-ended Tubes	7/9
150 New Tubes, 26 × 2¼	5/11
Rubber-studded Covers, best make	25/-

ENGINES.

4¼ h.p. PRECISION Engines, new 1912 models. Your present engine taken in exchange. Delivery from stock.

MILLENNIUM 2-SPEED GEARS.

Delivery from stock, 1912 models. Machine can be started with wheel at rest on ground.

Cash or exchange.

MISCELLANEOUS.

B. & B. and Amac Carburetters	5/6
Wire Car Wheels, with good Goodrich Tyre, each	10/-
New Amac Variable Jet and h.-b. control	18/6
New B. & B. Carburetter, h.-b. control	21/6
Longuemare, Minerva, F.N. Carburetters	4/6
Long Handle-bars, dropped ends	5/6 and 6/6
Coronet Silencers, up to 5 h.p.	3/3 and 4/6
New Handle-bar Mirrors	2/3
Gripskin Belting: ¾in. 10d., ⅞in. 11d., 1in.	1/-
Wide Mudguards, 4in. pair	2/11
New Sidecar Frame, Wheel Fittings, and Guard	35/-
Minerva Twin Plain Coil	6/-
Powell & Hanmer 51 Lamp	11/6
16 Guinea Lowen Sidecar	£4 4
Nearly New Coronet Sidecar	£3 10
New Wheel built with 1912 Millennium 2-speed hub, belt rim	£9 0
New Footrests	2/6
New Mirror Lens Lamp with generator	12/6
New Coronet Pistons, 81 mm. bore	2/6

Booth's Motories,

Keighley Mills, Bedford Street North, Halifax.

Let us do the

SPADE WORK.

Buy your new machine at "THE SPOT for Bargains" and we will tune it up and get it into thorough going order and deliver it ***ready to ride***. We do the spade work and don't expect our clients to after they get delivery of the machine. But that is only one advantage of buying from Maude's. The fact is, there are so many advantages that we have only space to dwell upon ONE each week. We take your old mount in part payment for a new 1912 model. Cash, Easy Payments, or Exchange.

LONDON, ——— W.

MOTOR BICYCLES FOR SALE.

1911 Premier, £34; 1911 Bradbury, £35; 1910 Triumph, £35; 1910 P. and M., £38; 1912 Triumphs, P. and M's, Bradburys, Ivy motor cycles.—T. Reed, Nettlesworth.

7h.p. Twin Peugeot, with best Montgomery sidecar, Albion plate clutch, back hub, Whittle belt, 6in. adjustable pulley, lamp, horn; £40; trial. — Hardy, Teviot Dale, Stockport.

HUMBER, 1911, 3½h.p., 2-speed, free engine, takes sidecar anywhere, lamp, horn, new valve, tools, new Watawata belt, Dunlops, in fine condition; any trial; £38.—227, Crookes, Sheffield.

ONE New 1911 Enfield, 2-speed, free engine, chain drive, slightly soiled, sell cheap; one Imperial Triumph, 3½h.p., with magneto, sound condition, sell cheap.—Parkinson and Co., Rawtenstall.

CLYNO 1912 Motor Cycle and Sidecar, ridden 250 miles, just received delivery, absolutely new; cost £85; financial reasons for selling; accept £80.—Apply, Laughton, Cycle Dealer, Leopold St., Sheffield.

PREMIER Motor Cycle for sale, Millennium 2-speed, free engine, new June, 1911; cash offers, or exchange for new machine of approved make, pay cash difference.—J. Langton, 26, High St., Chorley.

ORIENT Motor Cycle, 3½h.p. Norton engine, B.B. carburetter, h.b.c., Druid forks, Bosch magneto, just overhauled, perfect condition, tools, lamp, horn; nearest £17.—Cole, 77, Barlow Moor Rd., Didsbury, Manchester.

READY for Delivery.—2¾h.p. lightweight, in excellent order, magneto, free engine, B. and B. carburetter, h.b.c., heavy rubber studded tyres, almost new; trial by appointment; £12 cash.—T. Patrick, 34, Byelands St., Middlesbrough.

TRIUMPH, 1912, clutch, new Feb., £50; Triumph, 1910, in sound order, complete with F.R.S. lamp, £27; 1912 Quadrant, 3-speed, and F.E., as new, £47; T.T. Rudge, 1911, new Oct., £39; 1912 6h.p. Zenith, £62.—Barker and Stacey, Dronfield.

PHŒNIX Forecar, 2-speed, free, handle starting, magneto, new carburetter, tyre, and tube, recently painted and overhauled, £15; also Bradbury motor cycle (1911¾), 2-speed, free, not ridden 50 miles, £45, or near offer.—16, Chelsham Rd., Bury, Lancashire.

PREMIER 1912 Motor Cycles.—In stock for immediate delivery, 2¾h.p. lightweight, standard model, £36; 3½h.p. standard model, last of 1911 contract, new, reduced price £39, genuine bargain; 2¾h.p. lightweight, 3-speed, free engine, £46.—Official agents, Robinson and Price, 39, Whitechapel, Liverpool.

NORTHERN Depot, Ltd., everything motorish, Leece St., Liverpool.—In stock for Easter, all new 1912 models, finest assortment in Liverpool, clutch Triumph, clutch Kerry-Abingdon, 2-speed Kerry-Abingdon, Humber 2h.p. lightweight, 8h.p. 2-speed Rex-Jap, Clyno; another Clyno for April 27th; Northern special sidecars, 5gns., complete; de luxe torpedo body sidecars, 12gns., equal to the finest made; Millfords in stock; foot muffs, luggage carriers, and every requisite for the Easter tour; showrooms not quite out of builders' hands, but all above goods in stock.

GREAT Sale of motor cycles.—3½h.p. Rex, £7/10; 4h.p. Chater-Lea, magneto, spring forks, B. and B., £12; 3h.p. Triumph, £9; 1909 Douglas, £18/10; 1911 Kerry-Abingdon, £28; 5-6h.p. Rex, 1909, twin-cyl., free engine, and sidecar, £25, worth £40; 1908 Triumph, new condition, £25; P. and M., nearly new, 2-speed, free engine, £37/10; we have about 60 second-hand motor bikes in stock, consisting of 1907, 1908, 1909, 1910 Triumphs, prices from £15; several Bradburys, Siagers, Moto-Reves; all machines sold are warranted in good order; sidecars from 50/-.—The Motor Cycle Exchange, 160, Young St., Sheffield.

SECTION III.

Carnarvon, Denbigh, Flint, Cheshire, Derby, Stafford, Shropshire, Montgomery, and Merioneth.

3½h.p. Rover free engine motor cycle, new, with sidecar.—J. Cooke, Sandbach.

BRADBURY, 1912, brand new, unridden; what offers?—Braaden, 151, Welsh Row, Nantwich.

RUDGE, T.T., bought last autumn, new tyres; any examination; £37/10. — Parry, Gayton, Heswall, Cheshire.

2½h.p. Magneto Ariel, excellent condition; £16/16; trial; photo.—Hill, photographer, Abbot's Bromley, Rugeley, Staffs.

TRIUMPH, standard, 1908, everything in splendid condition; £27, or near offer.—Speed, Watergate St., Whitchurch, Salop.

£7.—Rex, m.o. valves, low, long, new tyres, engine wants cleaning, and new coil.—Particulars, T.S.A., 20, Wellington Rd., Rhyl.

3½h.p. A.S.L.-J.A.P., new last April, excellent condition, accessories; £36, or offer, bargain.—Greenhalgh, Dawley, Shropshire.

B.S.A., late 1911, 3½h.p., standard model, with or without Montgomery sidecar, perfect condition; what offers?—Lowe, Old Mill, Congleton.

BAT 4h.p. Motor Cycle, only used few times, splendid hill-climber; sacrifice for £28 if sold at once.—81, Spring Bank, New Mills, Derbyshire.

TRIUMPHS, free engine models, B.S.A. 2-speed and free engine models in stock; no waiting.—Motor Depot, 49, High St., Black Heath, Staffs.

We afford special facilities to

CLUBS

who wish to appoint us their Official Repairers and in buying generally **SECOND-HAND MOTOR CYCLES OF ALL KINDS.** We always have a large stock at bargain prices for Cash, Exchange, or Gradual Payments. Every machine thoroughly overhauled and ready for riding. Write for List now and get fixed up before the season is further advanced. The following are a few specimens. All fully guaranteed:

Stock No. **SECOND-HANDS.**

210.	**REX DE LUXE** 7 h.p., 1911 model..	£44
277.	**TRIUMPH** 3½ h.p., 1909 model, tourist	£28
228.	**F.N.** 4½ h.p., 4-cylinder model	£22

Unofficial Records.

THE present is an era of record breaking, and the motor cycle pastime is quite as much to the front in this connection as any other form of sport; in fact, it is more so, and we have so many records on the carpet that they are becoming well nigh bewildering. We have no fault to find with properly authenticated record attempts, but we think it is time to suggest that in future all records, no matter in what direction, should receive the hall mark of the governing body of the pastime before they be accepted. We are often asked to assist riders by sealing their machines and to receive at our offices proof of their visits to various towns and villages on the lines of their route by the posting of signed cards. This we have willingly undertaken, because it is our duty to record all important events in the history of the sport and pastime, but in our opinion it would be very much better for all concerned if all test rides and record attempts, of no matter what description, were done under the ægis of the Union. The difficulty is that the A.C.U. cannot recognise any performance on the highway where the legal limit of speed is exceeded. However, there are many methods of demonstrating the capabilities of a machine and its rider without resorting to excessive speeds, and such performances might quite reasonably be observed by A.C.U. officials and proper fees be charged for the checking and certifying.

Last year a well-known rider did set out to establish a record under proper A.C.U. surveillance, but, unfortunately, met with an accident, over which he had no control, and was compelled to relinquish his attempt. This alone proves that the A.C.U. is quite willing to undertake the checking of long distance rides.

A good deal of what we look upon as unnecessary exploits in this direction would be suppressed if the Auto Cycle Union were to issue certificates of reliability, hill-climbing, etc., on the lines of the certified performances which the Royal Automobile Club undertakes in connection with motor cars and accessories. This method has always appeared to us to be such an excellent one in every way for hall-marking a performance that we recommend its consideration to the Auto Cycle Union Committee, not only as a means whereby the pastime may be benefited generally, but also as a remedy for depleted coffers. It would be, we think, useless to argue that the expense of such checking and certifying would hinder riders from undertaking the trials or record attempts, or that the A.C.U. could not make a profit out of the fees. The suggestion we make is one that should receive the attention of the A.C.U. and the Manufacturers' Union; the former in the interests of sport, the latter as a business proposition. If both bodies were to set their faces against unregistered performances they would die a natural death; the time is opportune to kill them.

Last year, at the commencement of the record breaking season, we made another suggestion, viz., that as the A.C.U. could not recognise certain records it might be advisable to form a special body which would hall mark these performances on the lines of the Roads Records Association which controls cycling feats which the N.C.U. cannot recognise. Our suggestion bore no fruit, but it would be better for the pastime if this were done than to allow the question of unofficial records to drift.

Gathering of members of the Taunton and District M.C.C.

Marseilles to Nice Road Race.

THE most important road race of the season in the South of France was held on the 7th inst. from Marseilles to Nice—a distance of 122 miles—and was won by Berlié on a twin Moto-Rêve of 63 × 80 mm. bore and stroke, at an average speed of practically 39 m.p.h. The race, which was held for the second time by the Moto Club de Marseilles, and elicited forty entrants, was distinctive by reason of the remarkably fine country to be traversed. Starting from the suburbs of the great seaport at 6 a.m. at intervals of one minute, the competitors ran through the smiling Provence country to Trets and Brignoles, touching the shores of the Mediterranean again at Fréjus. From this point they had to climb into the Esterel, comprising twenty miles of magnificent mountain country with only one house on the entire route. Starting from the sea level at Fréjus, they rose to an altitude of more than 1,000ft., then dropped down to the sea level again at Cannes. Practically half the distance through the Esterel was up beautifully surfaced roads cut out of the face of the mountain, and the other half was a dangerous winding descent. From Cannes to Nice the road ran close to the sea shore, and was perfectly level. Owing to the dangerous nature of the road, however, by reason of the presence of tramways and vehicular traffic, the competitors were given one hour in which to cover the twenty miles. The finish took place on the famous Promenade des Anglais at Nice. Results:

MOTOR CYCLES OF MORE THAN 500 C.C.

	h.	m.	s.

MOTOR CYCLE ROAD RACE IN THE RIVIERA.

Desister (N.S.U.) negotiating one of the numerous bends.

Aler (Magnat-Debon) on the Esterel Pass. A. Berlie (Moto-Reve), the winner, rounding one of the difficult S bends of the Esterel. The photographs were taken between Frejus and Cannes.

OCCASIONAL COMMENTS.

BY IXION.

The Novice's First Machine.

At this period a number of novices are busy wrestling with their first machines, and a few hints may prove useful in acquiring that centaur-like understanding of the jigger which is essential to enjoyable riding.

The first necessity is to acquire the art of mounting, and I recommend taking the machine to a dip in a lonely road, and after removing the belt, to practise mounting and dismounting and braking, until perfect confidence is attained—a process that need only occupy half an hour. In practising mounting with the engine firing, one hand should be kept on the valve lifter lever, and the other on the throttle lever. The engine can then be instantaneously stopped by a twitch of either forefinger, and mounting is as easy as with a push bicycle. Starting troubles are avoided by warming the engine up on the stand; a novice should never essay starting the engine unless it has first been warmed up for a few seconds, or at least freed by injections of petrol or paraffin.

Finally, it is a great tip for the novice to use a low gear. The tremors of learning are greatly enhanced by a 4 to 1 gear, with which many machines are delivered. The machine needs running along at a far greater speed to ensure an instant explosion when the valve drops, and it bounds away too quickly. I always instruct a timorous novice with a 5½ gear, and teach him to keep the throttle as nearly closed as possible until confidence is attained. Before the first traffic run, do not be ashamed to spend ten minutes with the machine on the stand, practising with the foot brake until the requisite toe movements become automatic. Theoretical knowledge scoots out of the brain at the first genuine emergency, and the muscular movements essential to rear braking should be made automatic, instinctive, and subconscious as soon as possible. Many novices rely on their front brakes in emergencies, and modern front brakes are usually fairly powerful; but sudden and violent front braking is the worst thing imaginable in a particular emergency rather frequent in the earlier rides, viz., approaching a corner at too high a speed, the rider being deceived by the smooth running of his mount.

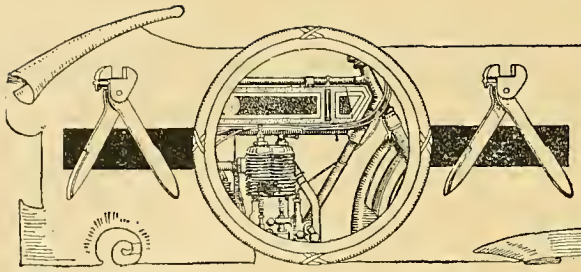
Inferior Tyre Repair Outfits.

I am rather sorry to notice that some makers continue to supply old-fashioned tyre repair outfits, containing patches and solutions of the very partially adhesive type, which became unsaleable on the ordinary market three or four years ago. Everybody knows that to-day several specialised brands of solution and patch are streets ahead of the normal types produced a few years back.

The old-fashioned types were efficient in the hands of a tyre expert. With the newer patented outfits the rawest novice can hardly botch a repair. Yet some motor cycle manufacturers are so penny wise and pound foolish as to send out kits which no up-to-date rider would ever dream of buying, or even of using. I hope the erring manufacturers will be persuaded to include really good stuff in the near future. They might just as well give nothing away as these inferior outfits which are barely suitable for repairing push-bicycle tyres, and are not always suitable for those.

Starting Engine by pulling up Rear Wheel.

Those ardent spirits who have bought T.T. machines devoid of pedals should not rest content until they can rely on their engine starting easily and surely when the rear wheel is pulled up. This is not always easy—and sometimes even impossible—when the engine is tuned to the adjustments which win hill-climbs. But it is desirable for a machine not intended for competition. The adjustments include a narrowish spark gap, some choking of the bottom air, not too large a jet, knowledge of the most suitable setting of the carburetter levers, and an ignition not unduly advanced. These adjustments are compatible with the attaining of fifty miles an hour on the road, which is amply sufficient for fast road work.



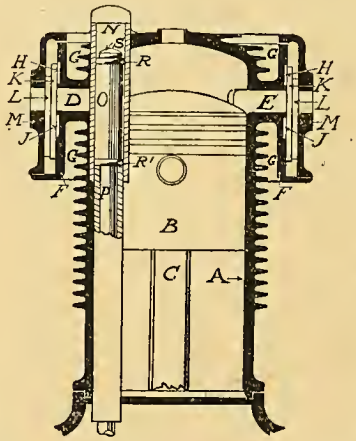
I am just busy performing these settings on my own brand new T.T., which as delivered was a shockingly bad starter. I have inserted a choke tube, and considerably retarded the ignition, which caused bad back-firing when the machine reached me.

If the rear wheel were pulled up, engine refused to fire at all on the stand if the ignition were retarded, as the spark was not hot enough with the armature out of maximum position. I have not yet got things quite to my liking, and fancy I shall have to raise the petrol level a shade, before a gentle pull-up of the wheel starts the engine-song with certainty.

I notice some makers who retain a rear brake *inside* the belt rim are arranging for the rear wheel to be withdrawn without unshipping the brake, by splaying their rear forks sufficiently for the wheel to be edged past the brake shoe. This is all to the good, and is quite as efficient as fitting the brake outside the periphery of the belt drum. I doubt if these outside brakes are quite as powerful as the inside patterns.

In the winding Devonshire lanes during the progress of the M.C.C. Jarrott Cup Competition. The rider is Geo. Brough (6 h.p. Brough) nearing Holne Chase.

A NOVEL SLIDE VALVE ENGINE.



BY AN ENGINEER.

THE successful application of the slide valve principle to engines for motor cars has undoubtedly whetted the appetite of many motor cyclists, and, accordingly, not a few among them look forward to the advent of a slide valve-engined cycle with considerable interest. On this subject there can be no question, however, that it is mainly by the aid of water-jacketing that this sort of motor has been rendered practicable, and few types of the slide valve would be of use without provision for water-cooling the cylinder. But a general objection appears to prevail against water-cooled motor cycle engines.

The modern air-cooled motor cycle engine is, without doubt, a very efficient prime mover, achieving quite remarkable performances. That it turns at high speeds, propelling a machine for mile after mile under adverse conditions, yet with great regularity and precision, is striking proof of its efficacy. The excellence of workmanship and material also has a great deal to do with this service that the motor cyclist receives from his mount. On the other hand, it will be admitted by experienced persons that the valve mechanism—the mushroom valves of the motor—is not free from defects, inasmuch as the heat generated by the engine renders the valves liable to warping and fractures, and their springs to loss of their temper. If it were not for these deficiencies the motor cycle engine would be almost perfect: they constitute the rift within the lute which is ever prone to annoy the motor cyclist *en route*. For some time past much ingenuity has been expended upon improving the mushroom valve; nevertheless it does not appear at all easy to overcome the difficulties mentioned.

In view of such facts, together with recent developments in engine construction, one turns, naturally enough, to a consideration of the possibilities of the sliding valve system. Valves of this kind demand extremely thorough means for lubrication, which when achieved is a great advantage in itself, but usually a water jacket is an essential feature in order to prevent the oil from being dried or burnt up. Once we come to the application of ordinary slide valves, whether reciprocating or rotary, to an unjacketed, *i.e.*, air-cooled, engine we are likely to be disappointed, for they cannot well be oiled, and are, *ipso facto*, of little or no use. At any rate, they are almost certain to prove poor substitutes for the familiar mushroom pattern. And, although valves of the last mentioned category work in an unlubricated state in direct contact with the heated cylinder, I think—nay, I know—that most experimenters who have attempted to utilise sliding valves in a similar way have experienced failure. Hence I am particularly interested in the design now before me of a forthcoming new engine for motor cycles, because it would seem to approximate closely to the ideal

The figure reproduced is a sectional side elevation of the vertical single-cylinder, having a diameter of 82 mm. (3¼in.), with a piston stroke of 101 mm. (4in.), and it shows the special construction clearly. Within the unjacketed cylinder A are the usual piston B and connecting rod C, but it will be observed that, though the cylinder is provided with the customary radiating ribs or fins, there are two large slot ports D and E for admission and exhaust respectively. These ports form two junctions with the cylindrical flange F surrounding the cylinder head (at a distance of about half an inch therefrom), and the whole is an integral casting. With the exception, therefore, of these port junctions between the cylinder and flange, there is an annular air-cooled space G around the cylinder head. This ventilated space is for the purpose of carrying off the heat from the cylinder and insulating the hot cylinder from the chest in which the valves are arranged to work. This is a decidedly ingenious departure, and, no doubt, its utility, quite apart from the novelty, will readily be perceived.

Above and below the ports (D and E) is a pair of packing rings H and J, and embracing the flange F concentrically are a pair of thin, narrow valve rings K and L, provided with slot ports (not shown) corresponding to those at D and E. A second removable flange M, adapted to be bolted to the out-turned lower rim of the flange F, forms a circular cover comprising the valve chest. It has inlet and exhaust port holes as indicated, and a pair of integral slide-ways for the valve guides, one of which is seen in section at N. Within this slide-way N is the hollow circular valve guide O, and the slide rod P passes through it, holding the upper and lower edges of each valve ring by means of clips R and R1, which are secured together by the bolt S. The valve rings are reciprocated in proper sequence through their slide rods that are moved in the usual manner by a pair of half speed gear wheels, having attached to them two small cranks and connecting rods, in lieu of cams. In the position illustrated the piston B is at the completion of the compression stroke, when the inner pressure-holding valve K has descended to its lowest point, its ports being covered by the packing ring J.

A Novel Slide Valve Engine.—

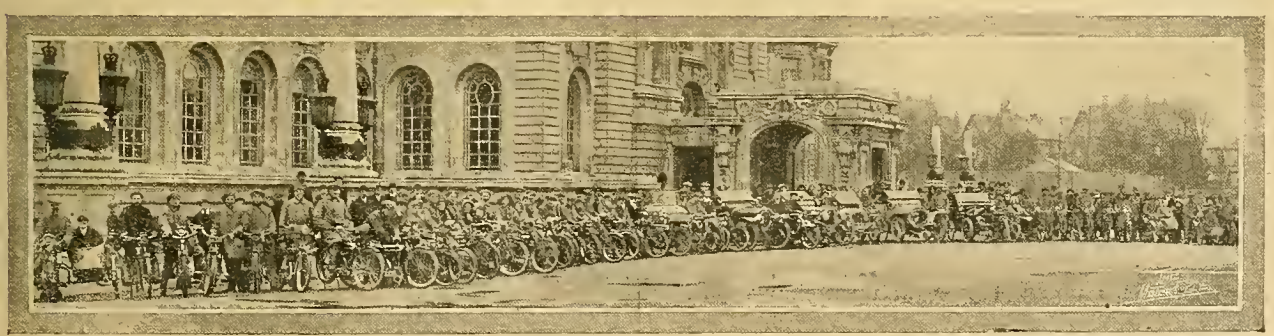
The working piston B is lubricated by crank splash, but the valves are oiled mechanically by forced feed apparatus, which, for the present, I am not at liberty to describe. It may be said, however, that the lubricant is forced in regulated quantities to the top of the valve chest, while the lower edges of the valves dip into the constant level of an annular oil well. The oil is pumped from the crank chamber, and the surplus finds its way back thereto by an appropriate conduit. The reader will, perhaps, understand the importance of the annular air-cooled space G, for thereby practically nothing exists to cause overheating of the valves. Through this air way the draught affords ample insulation from cylinder heat, and I am of opinion that it assists rather than retards the cooling of the main cylinder. As for the valves themselves, it is clear that they are extremely light and well guided, and also that they are easy of approach for cleaning or renewal. I should say that valves of this sort so arranged ought actually to wear longer than the working piston, for the reason that they are balanced, have no side thrust, and are subjected to but little heating effect. One cannot expect more than this from any type of valvular mechanism, and one does not usually get so much.

A Convert: A Coal Strike Episode.

IT was the second week of the coal strike, and railways were practically useless as far as passenger traffic was concerned, when a Birmingham clergyman had to speak at a meeting at Malvern at 3 p.m. and return to Birmingham in time for another meeting at 8 p.m. Trains were so scarce that in order to reach Malvern by three o'clock it was necessary to leave Birmingham at a few minutes after nine.

The question was how to reach Birmingham before 8 p.m., when the only train certain to run would not arrive till close on midnight, although a train might possibly be leaving Malvern at 6 p.m., arriving in Birmingham some time after eight o'clock. Obviously the only alternatives to trains were to motor by road or travel by air. The first alternative was chosen, so accordingly a 3½ h.p. Zenith and sidecar were generously placed at my disposal by a friend, and it was arranged that I should meet the reverend gentleman at Malvern at 5 p.m.

Leaving Birmingham at 3 p.m., I made very good running with the empty sidecar, although hindered by a strong head wind, and, reaching Droitwich, I stopped to take oil and petrol aboard. This and a few minutes' conversation on the evergreen topic of carburation occupied some twenty minutes. Proceeding on my way, Worcester was reached without incident, and I crawled through the traffic, turned to the right at the Cross, and headed straight for the Malvern Hills.



Easily overhauling two motor cars, I reached Malvern some minutes before five, but having to enquire and find my final destination, I finally reached it dead on time. The keen wind had sharpened my appetite, and half an hour was allowed for tea. At five minutes after the half hour the Zenith was headed back for home with the passenger on board. With the same strong wind now helping us, I appreciated the Zenith gear, as it was possible to speed easily along on a high gear without the engine labouring in the least.

On Worcester tram setts my passenger appreciated the luxurious springing of the sidecar; he had already expressed surprise at the speed and hill-climbing power of the turnout. Droitwich was passed, and Bromsgrove saw us make our first stop to light up. The sky had got very overcast, and we anticipated a return to the rough weather of the morning.

As we passed through Rubery a few flakes of snow fell, and before we reached Longbridge we were in the thick of a blinding snowstorm. Goggles were useless and were discarded. I could then see better, but had to be constantly mopping my eyes, as the soft snow plastered on my forehead and, melting, literally filled my eyes with water. Twice we nearly crashed into vehicles as we overtook them, although I had reduced speed to a mere twelve miles an hour.

Eventually we ran clear of it at Selly Oak, but time had flown considerably, and it was nearly eight o'clock. Through Birmingham, we dodged the traffic, and I eventually landed my passenger only two minutes late.

We had both managed to keep dry, thanks to waterproofs and oilskins, but the last thirteen miles had been extremely severe, and had occupied an hour and five minutes. Despite the discomfort of the last stage, my passenger was converted; he had to confess that the sidecar was quite as comfortable as a car, and, as for convenience, if he had waited for the possible train at six o'clock he would not have reached the second meeting till nearly an hour late. However, he now no longer looks down on motor bicycles as noisy, nasty nuisances. A.G.D.C.

A long line of members of the Cardiff M.C. assembled outside the City Hall, Cardiff, on the occasion of the club's opening run to the Speech House, Forest of Dean.

How to Cheapen Running Expenses.

By "IXION."

NO motor cyclist who keeps strict and accurate accounts ever found motor cycling an expensive hobby. Not one rider in a thousand can point to any large compulsory expenses, except the first cost of his machine, and the loss due to depreciation when he comes to sell it. The faint rumours of the costliness of the hobby arise in the following way. Unbusiness-like persons of a self-indulgent temperament buy a machine, and, though they keep no accounts, they discover at the end of the year that quite a number of tradesmen's accounts remain unsettled. As the motor cycle has been their sole new cause of expenditure, they pull a wry face, and remark to themselves and to their acquaintances: "Hang it all; hadn't an idea motor cycling made such a hole in your purse. Those silly papers say it's cheap. All I know is, I've got to sell my jigger, and sell it quick, or the butcher, the baker, and the candlestick maker will be sending along a bit of blue paper!" The tale of woe sounds extremely plausible, and Smith, Brown, and Robinson, whose dens were littered with motor cycle catalogues, take fright and postpone the happy day indefinitely.

A Half Truth is often More Dangerous than a Lie.

In such cases the motor cycle is concerned in the temporary insolvency, though it is a gross libel to pretend it is the real cause. Before the now harassed and impecunious Wiggins got his motor bicycle he was leading a fairly simple life. He spent a shilling or two weekly on theatre tickets, tobacco, billiards, and the like, without feeling the strain. After he got his bicycle he remained a victim to these amiable weaknesses, because the motor bicycle did not occupy all his spare time by any means. *Moral No. 1:* Many a man can afford to motor cycle as his sole hobby, though not everybody can be a regular theatre-goer, local billiard champion, *cavalier des dames*, etc., etc.

The Cost of a Holiday.

Wiggins's annual holiday in his pre-motor cycle era probably consisted of a week or a fortnight at Scarborough or Yarmouth with two or three of the boys or one of the girls. He puts up in a cheap boarding house, and lavished half-crowns tolerably freely at various evening resorts. This cheap pastime disappeared when he bought his motor bicycle. He now "tours" the country, and spends each night of his fourteen days' holiday at a different hotel—often the best hotel in the towns he visits, partly because these are usually motoring houses, partly because his riding companions are often wealthier than he is.

The result is that two nights at hotels, coupled with two lunches at other hotels *en route*, various dust-layers in the form of roadside tipple, and two teas at a confectioner's, cost him more than a whole week's bill at the Yarmouth boarding house in ancient days. Moreover, he still paints the town red each evening of his holiday—he trots round to give the girls a treat, and ends up in the local theatre or billiard saloon.

Apart from his strictly motor cycle expenses, he is spending much more than he used to do; and if he rides 200 or 300 miles a day as well, uses up one cover, one belt, one valve, two plugs, a belt-fastener, has to pay a police fine, loses a generator and toolbag, purchases fresh wearing apparel because he forgot to pack sufficient collars and socks on his carrier, it is evident that the total bill for his annual outing may be double, treble, and quadruple what it once was, though perhaps not a quarter of the increase has been spent on the machine and its needs. *Moral No. 2:* Many a man can afford a motor cycle who cannot afford a fortnight's tour with meals and residence at swagger hostelries; and many a rider can afford a fortnight's tour, provided he be content with a stroll and a pipe after arrival at his destination for the night.

Different Methods of following the Pastime.

Once again, the careless type of petrol financier is usually rather a lazy bird. He knows how to mend a tyre; but it is a dull job, and when he has done it once, he prefers to employ the nearest cycle shop as his deputy, while he strolls up the street to invest in some fags or picture postcards. He knows how to grind a valve, doncherknow, but when he's been sitting on the beastly jigger all day a feller gets rather sick of it, and—why, here's a garage still open! Any fool can scrape the dirt off a machine, but one only carries a single suit on tour, and it would be a pity to spoil it; so he tells the ostler to polish it up a bit before morning. In the morning, honest Joe of the stable puts on a coaxing expression, and says: "There ain't just a few nicks abaht these 'ere blessed motor sisickles: took me two mortial howers, s'welp me, to get it like a new pin!" Wiggins looks a thought rueful, but realises that he must rise to the occasion, and bang goes another half-crown.

Temptation to Buy Superfluous Accessories.

Again, at one of the places where Wiggins stops to take in petrol there is a tempting display of the latest accessories. Wiggins feels a trifle ashamed of his perfumed oilies as he surveys the neatly-cut fawn gaiters with shaped calves ("14s. 6d., sir—thank you!"), and as he eyes the tool tray enviously, the astute salesman unloads a patent ratchet spanner, and a positively inspired belt-drill and cutter (which before evening has worn a huge hole in the unfortunate Wiggins's pocket, and also banged all the cuticle off his slender hip). Such is the progress of the amiable and thoughtless Wiggins along the primrose path of the unpractical motor cyclist. *Moral No. 3:* If you wish to motor cycle with economy, do all your own repairs and adjustments, and remember that clothes and accessories are not of such vital importance as to keep your jigger going.

So my advice to the would-be motor cyclist who desires to exhaust the thrilling joys of our fine hobby on 3½d. a day, and still to save enough to furnish a bijou villa for Belinda before the 1913 T.T., is fairly simple.

Making Up One's Mind.

He must first decide whether motor cycling is to be a substitute for three or four modest hobbies,

A perfect saddle service is the first essential to a successful Tour—

The luggage you leave at home will never minister to your convenience—

Touring Talks

for, nothing will weary you more rapidly than the saddle of inferiority. On the other hand the

BROOKS

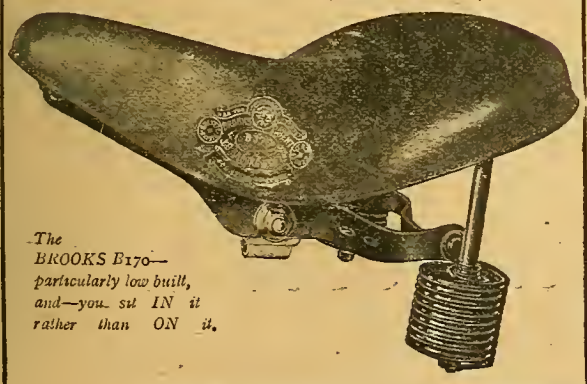
will make the longest ride—the roughest road—vibrationless!

It will ensure your perfect comfort under all conditions, and—

With it fitted you will reel off mile on mile, and, at the journey's end, feel fit to cover many more.

Below we illustrate the latest model—

It is the B170—the seat part of which consists of a steel base, carefully moulded on anatomical lines, comfortably cushioned and covered with substantial leather—



And test will prove its absolute superiority. Others are illustrated and described in detail in the Motor Cyclist's edition of the BROOKS BOOK, and—

That is free!

How to Cheapen Running Expenses.—

which at present provide him with recreation, or whether he can afford to indulge in it as an extra, and retain all the amiable outlets for expenditure which now grip him from 8 p.m. to 11 p.m. six days a week. He must next consider whether he can afford to expend more than £5 a week on his annual holiday; if he cannot, he must surrender the idea of a round-the-coast tour, or else scheme the route out very shrewdly, and cadge beds from wealthy aunts. He must make an invariable rule of eschewing garages except on those sad occasions when the best made piston shivers into shapeless fragments. Professional puncture repairs are the mark of the gilded youth or the early bankrupt

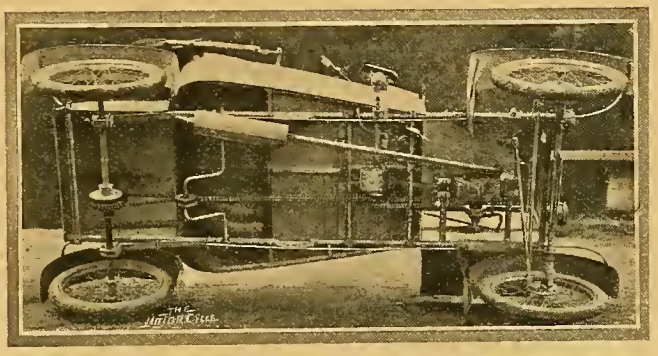
The Real Enthusiast.

He must finally remember that it is more imposing to ride up Birdlip in oilies with a prehistoric gas lamp, a small tool bag containing two rusty cycle wrenches, and a phthisical hooter, than to push up Sutton with a machine which bristles with nickel-plated accessories, and boasts a picturesque knot of expensive overalls tied round the handle-bars.

In fact, the wisdom of the sages records that the expenses into which a motor bicycle forces us total an annual sum at which the tip-expecting gamekeeper on a Scotch grouse moor would wrinkle his freckled nose heavenward, but that the outlay into which a motor bicycle can tempt a thoughtless youth with a 1 in 17 forehead would equip a Dreadnought.

AN 8 h.p. GORDON CYCLECAR.

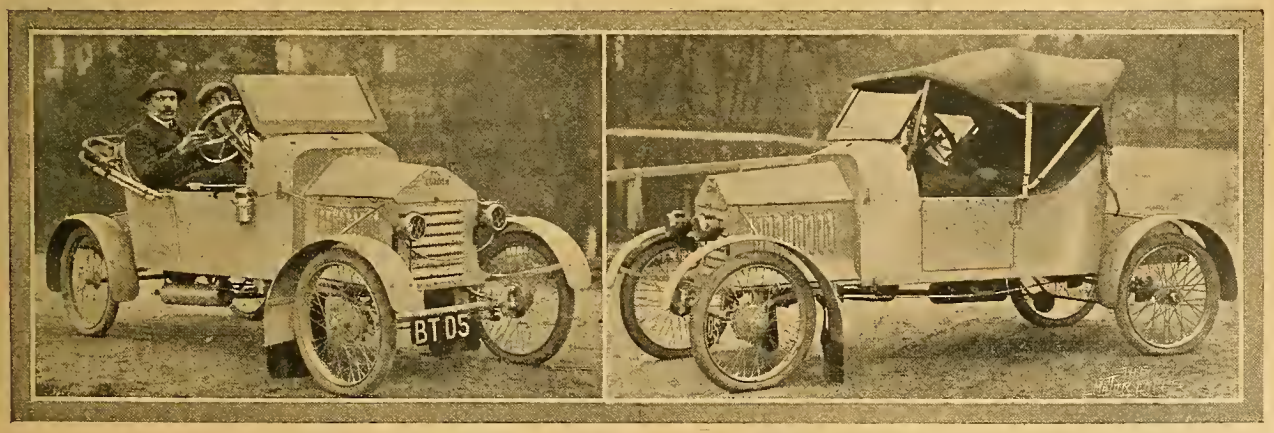
AFTER many months of hard testing, Mr. Gordon Armstrong, of the East Riding Garage and Engineering Works, Beverley, East Yorkshire, has perfected the Gordon cyclecar (which we first illustrated about a year ago) with a patent variable gear and differential. Great improvements have been effected on the latest model, which is far superior to the first one.



The engine, an 8 h.p. J.A.P., is air cooled by a very powerful fan, belt-driven from the outside of the clutch; the latter is of the multi-plate type.

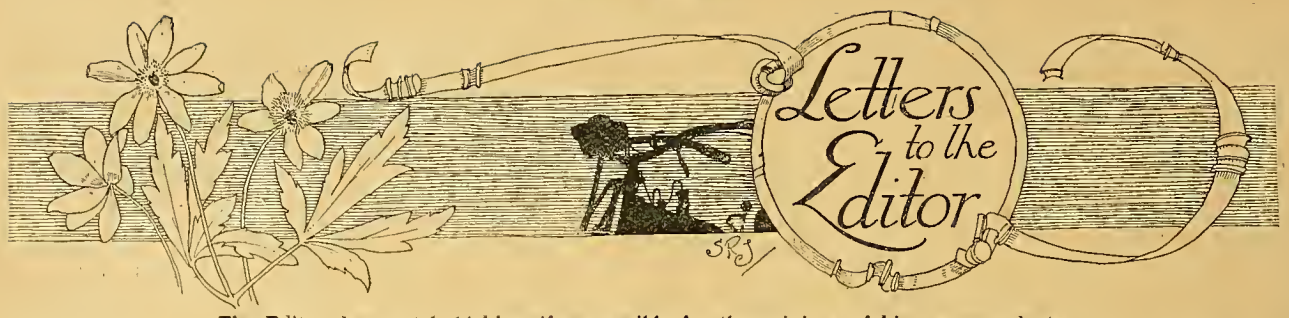
Mr. Armstrong having found that belt drive is not suitable for such heavy work, has changed the transmission from a variable gear and belt drive to a two speed, or three speed, and reverse gear box with chain drive. The tension of the long chain from gear box to rear axle is sustained at the correct adjustment by means of a jockey pulley carried on a cranked arm, which is clearly discernible in the first illustration.

The chassis and body framework is built entirely of steel tubing. The seat is slung from the top tube of the body frame to the cross tube, and is upholstered like an ordinary car body.



The panels are all aluminium screwed to the tubes; this system saves a great deal of weight, the complete car coming out at under 5 cwts. This we can quite believe, as Mr. Armstrong easily turned the car on its side to enable a photograph to be taken.

The engine is started from the side, and the second pull of the handle was sufficient to start it from cold without injecting petrol. During a short run, the car started very smoothly with the plate clutch, and was soon in top gear, climbing a fairly stiff hill without the least trouble at about 25 m.p.h.



Under side view of the chassis of the Gordon cyclecar showing chain transmission throughout, silencer, engine position, etc.

The car is fast, quiet, and comfortable, proving that the springing, which is of the Lanchester type, is ideal for light work. The fans do their work most efficiently. The clean, simple design gives one the impression that there has been care and forethought in the production of this cyclecar.

Threequarter side views of the Gordon cyclecar shown with hood down and up.

Three and Four-wheeled Cyclecars.

Sir,—Theory is not of much use in dealing with a practical question which must be decided by practical tests. Of course, anyone who has driven both a three-wheeler and a four-wheeler (and the best of each kind) is entitled to give his opinion—which will differ from the opinions of some other riders. But, for those who have not that practical experience, the following facts may be more useful than theories: (1.) A three-wheeler won very easily the only cyclecar race yet held, at a speed of about 59 m.p.h. The three-wheeler was, in fact, "first, and the rest nowhere." (2.) At this speed the three-wheeler was absolutely steady, whereas the only four-wheeler which approached it "snaked" badly and finally turned turtle. (3.) No four-wheeler has, as yet, got through an official long distance reliability trial, open to both three and four-wheelers, whereas a three-wheeler has been consistently successful in these trials. (4.) So far no three-wheeler with single front steering wheel has entered for any official trial. I may add that I was all in favour of four wheels until I was converted by experience. H. GEORGE MORGAN.

Proposed Hill-climb on Snaefell.

Sir,—Last year the Mersey Motor Club entertained the Dutch Club, and also accompanied them in the Isle of Man. Whilst there it was remarked what a pity it was that an event was not organised to entertain the visitors on the Saturday. In view of these facts, my committee instructed me to ascertain from the island authorities as to whether they would be willing to grant us permission so to cater for visitors, and this permission has now been granted. In the meantime, my committee applied to the A.C.U. for a permit for an open hill-climb, arranging that as soon as the permission was granted by the island authorities so soon would they notify the A.C.U. that the aforesaid permit was for Snaefell. My committee has no intention of interfering with the A.C.U. events or in any way robbing them of their just dues.

As I have not been able to summon my committee in order to ascertain its wishes, I cannot say more, except that personally I would be pleased to assist or act in co-operation with the A.C.U. if it would like to partner us in the concern, in a similar manner to the way in which it partnered my old club, the Newcastle and District M.C., at the first Sutton Bank hill-climb, of which I was hon. secretary. The event is being organised primarily for visitors, and the classes are so arranged not to cater unduly for T.T. riders; in fact, special prizes are being offered for novices.

In conclusion, this club has applied to the A.C.U. for re-affiliation. S. W. CARTY, Hon. Sec.

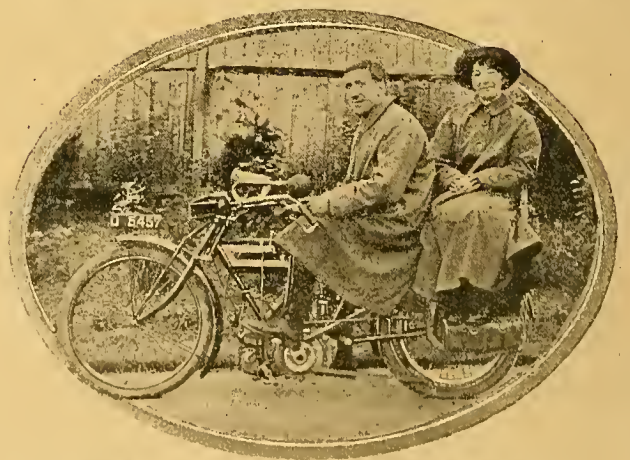
The A.C.U. Formula and Two-stroke Engines.

Sir,—Having followed keenly the correspondence regarding the A.C.U. formula as applied to two-stroke engines, I feel prompted to write in reply to your correspondent "A Believer in Four-stroke Efficiency," and for his enlightenment quote a few facts.

Firstly, that Scott riders quite understand and do not overlook the important fact that the A.C.U. formula is an "attempt" to compare the performances of machines on the point of efficiency. This is just our grumble, the "attempt," and what a miserable one it is.

Secondly, the handicap is not on petrol consumption, but on the type of engine. And I would here like to mention, for your correspondent's edification, that I know several Scotts doing eighty miles per gallon, which is not by any means extravagant, and necessary to handicap.

Lastly, the A.C.U. formula to your correspondent may not seem a great one, but probably he is looking on things with a jaundiced eye, and is not up against it like the Scott riders are.



Now in answer to his last letter, where he compares the P. and M. and Scott sidecar performances, I should like to know if he possesses a P. and M. sidecar, as, if so, I would not mind taking him on for speed up any of his pet hills . . . .

Anyhow I think in fairness to a big number of the A.C.U. members, who are Scott riders, the handicap ought to be removed or modified to give us, at least, a sporting chance, and not put us up against 5-6 h.p. twins.

REKALB, Jun.

Pillion Seats.

Sir,—May I beg a little space in your excellent paper for a reply to the numerous critics of pillion riding? On my 1910-11 3½ h.p. fixed gear (5¼ to 1) Ivy-Precision, my wife and I (total weight, 22 stones) have ridden some 3,000 miles, including two tours—North Wales (800 miles) and Somerset and district (500 miles). Personally, I find the running steadier and no increased difficulty whatever in taking corners. I use the machine a great deal solo, and have taken friends numerous spins. The back wheel, stays, and, in fact, the whole machine, are apparently none the worse for the increased strain. The tyres (ordinary Dunlop studded) stand up to the work splendidly. My only trouble has been belts, but since fitting a Whittle that has disappeared.

Mr. and Mrs. Turner (Ivy-Precision), who favour the pillion seat.

My method of mounting is, after my wife has taken her seat, to start in the usual manner, and then vault on sideways, throwing the right leg over afterwards.

I can personally recommend this mode of passenger carrying as absolutely safe, provided machine is sound, passenger weighs no more than 10 stones, and one drives carefully and at a moderate pace. W. B. TURNER.

Private Owners and Trade Riders. Three Classes Suggested.

Sir,—For some time there has been some discussion with respect to the definition of a private owner as laid down by the Auto Cycle Union. We all know that many men who sign a declaration that they are not in any way assisted by the trade are actually so assisted in various ways, whilst there are many competition riders who would undoubtedly compete more were it not for the fact that under the very comprehensive rule regarding trade riders they are classed as such.

I would like to have the views of your readers through your columns on this matter, and would suggest for their consideration—and if there be sufficient interest taken in the matter—that the question be brought before the Council of the Auto Cycle Union, and that there be in future three classes.

(1.) Amateurs *bona fide* pure and simple, who do not receive assistance in kind or cash of any sort from the makers of motor cycles and accessories.

(2.) Riders who are not connected with the trade, but who may be riding for a trade firm; also competitors who are in some way connected with the trade, such, for instance, as being employed by firms having retail businesses or connected with the industry in the sale of accessories or fittings, but who do not ride for the manufacturing firms.

(3.) Riders who are openly employed by large firms for competition purposes.

I would suggest that the Auto Cycle Union Council should make every competitor sign a declaration form when applying for a licence, and it should be at the council's discretion whether a man be transferred from 1 to 2 or from 2 to 3, or *vice versa*. There should be no argument on the matter, for if the council were satisfied that a certain man who had signed the amateur form was going about too much in a way that was not reasonable to expect, he should be transferred to class 2. The hardship and trouble in these matters lie in the fact that clubs promoting open competitions generally charge double fees for trade entries. Manufacturing firms have no reason to grumble at this; they can afford to pay. Amateurs only pay half; this is all right, as they are only out for sport, but why should the middle-class be penalised? In the majority of cases they only ride for sport, but in some slight way are assisted by the manufacturers.

S. W. PHILLPOTT.

Another Exceptional Hill.

Sir,—I notice in your correspondence columns, under the heading of "Another Exceptional Hill," the climb from Langdale Valley to Little Langdale is recommended as a test for hill-climbing enthusiasts. There is no doubt about it being a test, and I doubt whether any motor cycle would climb it, however skilful the driver. I have seen an expensive motor car defeated before the real ascent had commenced. I have often wondered if it could be climbed.

There is another climb which it would be interesting to know if anyone had done, and that is between Wrynose Pass and Eskdale, Hard Knot Pass (to ascend either way up, from Eskdale or Wrynose Pass). Hard Knot Pass is between four and five miles from Little Langdale—towards Eskdale.

J.H.W.

STAXTON HILL-CLIMB. The curious position of the rider will be noted; he appears to be lying along the carrier and seat.

Brooklands Easter Meeting.

Sir,—On page 405 of last week's issue your remarks as to the handicapping in the two motor cycle races at Brooklands are somewhat at variance with the facts.

We would remind you that in the Short Motor Cycle Race Mr. G. E. Stanley was riding a 2½ h.p. Singer, with a bore and stroke of 69 × 80 mm. = 299 c.c.

With this machine he was given the same start as other well-known riders who were mounted on 3½ h.p. machines, 499 c.c. It reflects great credit on his riding in being able to obtain second place under these conditions.

In the second race, which he won easily, Mr. Stanley rode a 3½ h.p. 499 c.c. machine, and, of course, started from the same mark as other 3½ h.p. riders.

SINGER AND CO. (1909), LTD.
W. E. BULLOCK, Works Manager.

The Speed of Motor Cycles in Leamington. A Warning from the Chief Constable.

Sir,—I respectfully wish to bring to your notice the fact of motor cyclists riding at excessive and dangerous speeds through this borough. No doubt you are aware the roads in and about Leamington are wide, well laid, and offer every inducement for motorists' comfortable travelling.

In addition to this, the local police authorities have laid themselves out to induce motorists to visit this town, without fear of running into any specially laid traps (a practice which I consider totally unworthy of any police authority to recognise). Notwithstanding this, I am sorry to say that a great many motor cyclists who visit this town have no regard for the safety of other people, but go racing through some of our principal streets at speeds varying from 18 to 30 m.p.h. My Watch Committee have had the matter under consideration, and have been forced to the conclusion that the police must take more drastic action with a view of bringing some of the offenders before the justices. I do not know how far you can help me in this matter, but I should be glad if you could intimate through *The Motor Cycle* in a friendly way a caution to motor cyclists to exercise a little more care with regard to excessive speed when passing through this town, and to take this warning in the spirit in which it is given, and so obviate the necessity of any police proceedings.

T. T. EARNSHAW, Chief Constable.

The scene in the market place at Richmond (Yorks.) on the occasion of the annual meet of motor cyclists, which has always been well supported by North Country riders.

Cold Vulcanising.

Sir,—I was interested in your reply to a correspondent in a recent issue on "Cold Vulcanising."

I notice you recommend the "Ara" outfit, and can testify to its excellence for outer cover repairs, but, like your correspondent, I cannot get patches to stick on tubes, and can get no assistance from the makers, who simply tell me I am not following instructions. I follow them to the letter, but can still pull the patches off easily. A motor cycle tube does not seem suitable to the process, but I write this letter in the hope that some reader may have found a way of overcoming the difficulty. If the "Ara" process was as good for inner tubes as it is for burst covers, it would be a blessing. CLARENCE PONTING.

A copy of the above letter was submitted to Ara Ltd., who reply as follows:

Sir,—We beg to thank you for kindly forwarding to us a copy of your correspondent's letter, and we are pleased to give all the assistance we can to those readers who are using the "Ara" vulcanising process.

Your correspondent says he has a tube which he cannot repair by it, and, considering the thousands of "Ara" vulcanisers that have been sold, and the large number of testimonials we are receiving from motor owners who use the "Ara" vulcanising process for this work only, it is, to say the least, somewhat extraordinary.

We think, in view of what the letter says, one of the best possible means of testing the difficulty would be to send the inner tube on to us, and we will place the same in hand for repair free of charge.

It is a fact, however, with which you may be acquainted, that some rubber articles, inner tubes and outer covers, etc., cannot be repaired by any known process satisfactorily, but these cases are so rare that we shall be surprised to find in these days a firm manufacturing worthless rubbish of this kind, as, of course, the value to the consumer is quite as much represented by good repairing possibilities as other good points. ARA, LTD.

Consumption Comparisons.

Sir,—With reference to the correspondence on the above taking place in your columns, it has always appeared to me as a man engaged on fairly heavy engineering work, and as one with about ten years' actual experience in this line, that motor cycle designers, or the buying public, do not take efficiency into consideration when designing, or buying their machines.

It is a well-known fact that any engine, especially internal combustion ones, are extremely inefficient, working on light loads. After a riding experience with an old pattern 2¾ h.p. a.o.i.v. motor cycle, geared 4½ to 1, I am firmly convinced that carrying the extra weight and having a larger engine, running most of the time on a very light load, is not efficient by a very long way. With my "old crock," with the engine showing plain signs of wear and the compression doubtful, I can tow a person on a push bicycle at a speed exceeding the limit anywhere and up anything it is possible to ride a push bicycle up without very great exertion. Riding alone the difficulty is to find the engine something to do. Of course, I get stuck on very steep hills, but a two-speed gear would overcome that, therefore, why heavy machines with large engines running most of the time inefficiently? This, I think, is where the car wins, as most cars seem to have efficient change gear arrangements, which allow a smaller engine to be worked at a better load factor.

Referring to your correspondent who says the water-cooled engine takes up heat at the commencement of the stroke, part of which it gives up again as useful work at the end, or near the end, of the same stroke, is not clear to me. I am not "learned" in this, but, judging the effect of the heat at exhaust (sufficient in some cases to make the connections nearly red-hot), I rather think the taking up game would go on through the whole stroke. He must be thinking of steam engines; something of this sort takes place in those, I believe. Cannot motor cycle and car makers be induced to rate their engines in b.h.p., and give us the consumption per b.h.p. hour at full and part loads? M.A.P.

"BELT" RELIABILITY

If you have a doubt as to which is the Belt for "Reliability" the following Record will surely help to dispel it.

At the great M.C.C. LONDON-LAND'S END 550 miles Run on April 6th, 1912—one of the "classic" events of the season—

The JARROTT Cup was won by H. Karslake

riding a standard 3½ h.p. Rover Motor Cycle fitted

with a 'LYSO' BELT

winning premier place against 46 competitors.

As you are probably aware, this Race was run under the most adverse conditions—against half a gale of wind, dust, and parts in pouring rain and fog; various difficult hills with steep gradients, hairpin bends, right-angle turns, etc., and described by the Press as "the stiffest and most severe course."

At Holne Chase Hill, the most difficult part of the course, the scene of many spills, and on which 75% of the riders had to make two attempts to get up, Mr. Karslake made a clean ascent of the hill FIRST TIME—the Press description of his ascent being "a very good climb"—and at one point on the hill he had to ride around a competitor who was falling, on a gradient of 1 in 4!

The above facts but serve to again emphasise the "Reliability" of the "LYSO" Belt and mark its supreme efficiency as a dependable "power-transmitter."

For ordinary work, and extra-ordinary work—and particularly for machines with Sidecars—"LYSO" is the Belt you should use, always.

Obtainable of all Agents. Prices: Size ⅝in. 1/5; ¾in. 1/9; ⅞in. 2/1; 1in. 2/4; and 1¼in. 2/9 per foot.

LYCETT'S, "The Saddlery," Bromley Street, Birmingham.

R.H.S.

A SIDECAR TRIAL.

THE Coventry and Warwickshire Motor Club successfully carried out a novel trial for sidecar combinations only on Saturday last, for which sixteen entries were received. The start was from the outskirts of Coventry at 2.40 p.m., and competitors were despatched singly over the following route: Kenilworth, Leek Wootton, Warwick, Barford, Wellesbourne, Friz Hill, Kineton, to Edge Hill, which test gradient had to be ascended on the run. Competitors were then directed past the Round Tower, down Sunrising Hill, and, thanks to the assistance of the Rudge Cyclists' Corps, along narrow and tortuous lanes, *vid* Radway, to the foot of Edge Hill, this small circuit of about six miles having to be repeated five times. An involuntary stop put a competitor out of the running.

The event was divided into two classes: Class 1, for machines with engines up to 500 c.c.; and Class 2, for machines with engines over 500 c.c.

The mileage to Edge Hill was taken from the Contour Road Book, but it was afterwards found that the distance was not so long as stated. Consequently most of the competitors found themselves too early, and for five miles W. H. Wells, H. D. Teage, E. A. Gorton, and G. Smith crawled along on their low gears to the foot of Edge Hill. Despite this severe handicap the bigger machines easily reached the hill summit.

A special prize was offered for the highest ascent of Edge Hill on a 500 c.c. single-geared touring sidecar, and the possibilities of a sporting afternoon on Edge Hill brought several hundred spectators on cars and motor cycles to this well-known acclivity. It was hardly to be expected that a single-geared 3½ h.p. machine would reach the summit of the hill, although there were three who made the attempt, all on Triumphs. H. Holt stopped first, Frank Hulbert got much higher, but he was beaten by a private owner, Ambrose Elson, who got within about 200 yards of the top of the hill. Later in the day he made a clean ascent with a cool engine and gear of about 6½ to 1.

The necessity for passenger machine trials is proved by the fact that only five competitors made non-stop runs and survived the six ascents of Edge Hill, although the list would have been augmented by F. Pountney (Rudge-Multi), had he not unfortunately punctured in Warwick, and J. R. Haswell (two-speed Triumph), who went off the course. It is particularly unfortunate that these two should have suffered as they did, as they were by far the fastest in the 3½ h.p. class on Edge Hill, particularly Pountney, whose Rudge-Canoelet combination had a surprising turn of speed.

H. T. Lloyd, one of the Triumph Company's testers, had out for the first time a Trinmph with a new two-speed counter-shaft gear, which is of the epicyclic type. It is very neatly arranged and more compact than the last of this company's productions, which we illustrated about November last. The final drive by V belt is retained. Lloyd was put out of the running by a sooted plug.

Start of the Coventry and Warwickshire M.C. first sidecar trial last Saturday. In the foreground W. H. Wells (7 h.p. Indian sidecar) is seen leading off.

In Class 2 the bigger machines made light of Edge Hill, despite its length and 1 in 7 gradient. Geoffrey Smith (Enfield) and W. H. Wells (Indian) tied for first place, the former being adjudged the faster and the latter having the more silent machine. H. D. Teage (Clyno) climbed the hill very easily and silently on each of the six occasions, but was not so fast, which could also be said of C. T. Lloyd (6 h.p. Rex sidette). The complete results are given hereunder:

CLASS 1.

1. S. Wright (3½ h.p. 2-sp. Humber), non-stop.
   J. R. Haswell (3½ 2-sp. Triumph), ran off route, otherwise non-stop.
   F. Pountney (3½ Rudge Multi), puncture.
   H. T. Lloyd (3½ 2-sp. Triumph), stopped third round.
   Bert Yates (3½ 2-sp. Humber), stopped third round.

The undermentioned stopped at Edge Hill on the first round: Ambrose Elson (single-geared Triumph), H. Holt (single-geared Trinmph), W. J. Spittle (3-sp. Premier), F. Hulbert (single-geared Triumph), and A. Wright (Triumph, N.S.U. 2-sp.).

CLASS 2.

1. { Geoffrey Smith (6 h.p. 2-sp. Enfield), non-stop.
   { W. H. Wells (7 2-sp. Indian), non-stop.
   Henry D. Teage (5-6 2-sp. Clyno), non-stop.
   C. T. Lloyd (6 2-sp. Rex Sidette), non-stop.
   Edward A. Gorton (6 2-sp. Rex Sidette), stopped second round.

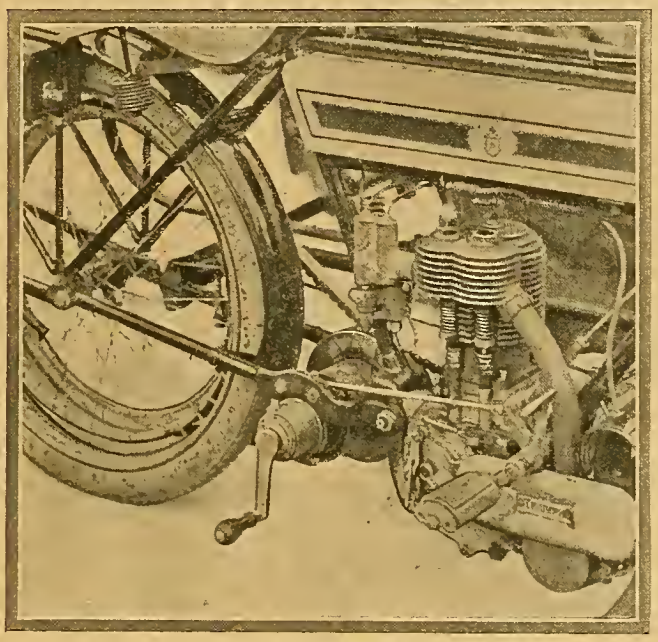
The judges were Messrs C. H. Elson, D. Elson, and H. M. Carter. Timekeeper, Mr. D. K. Hall.

C. T. Lloyd (6 h.p. Rex sidette) and H. D. Teage (5-6 h.p. Clyno sidecar) on the steepest portion of Edge Hill.

DUBLIN & DISTRICT M.C.C. RELIABILITY TRIAL.

With a whole gale of wind blowing and drenching showers falling, the club started its first reliability trial of the season on the 8th inst. from Donnybrook. The conditions were of the customary character, a scheduled pace of twenty miles per hour being fixed, with a number of open controls. Certain hills were also observed, and in addition there were a couple of secret controls. The course for the most part lay in the Co. Wicklow, and was a particularly trying one, including such hills as the Waterfall Hill on the south side of the Glencree Valley, Sally Gap, Drumgoff, and Auglavanagh. The distance was about 100 miles. Fortunately the day improved, and once out of Dublin the conditions were more favourable. The bad morning, however, materially reduced the field, and only twelve started. Result:

1, F. J. Walker (3½ Rudge); 2, P. J. Brady (3½ Rudge).



PROPOSED SCOTTISH MOTOR CYCLISTS' UNION.

FOR some years past there has been a movement in Scotland, having as its aim the foundation of a Scottish Union for motor cyclists. At present the pastime is controlled by the Scottish Cyclists' Union, a practically moribund body without funds and quite unable to assist the movement. The S.C.U. received its powers from the A.C.U., but the independents assert that the latter body had no standing in Scotland, and that in the Scottish Automobile Club is vested governing powers for all forms of motoring.

Last year informal conferences were held between the S.A.C. and representatives of several clubs, but not until this year was any great progress made. Early this year the chairmen of the Edinburgh and Glasgow clubs and of the Scottish A.C. formulated a scheme which the Scottish clubs are invited to discuss at a joint conference to be held at the Golden Lion Hotel, Stirling, on Saturday next, the 20th inst.

The Scottish A.C. are willing to give all the assistance in their power and to make a monetary grant towards initial expenses. They would also be prepared to grant through the proposed Union free legal defence, home and foreign touring facilities, copy of the handbook, hotel and hotel coupon arrangements, and use of their "guide" system, etc. For these benefits it is suggested that associated clubs should pay the Union a subscription of 2s. per member, or that individual members should pay 10s. 6d. per annum.

Such a scheme, with the resources of the Scottish A.C. behind it, should not, nor is it likely to, fail to meet with the approval of the clubs, which in the Union will have a body capable of looking after their interests and of effectively governing the pastime.

A NEW TRIUMPH GEAR.

The above two-speed countershaft gear, which is of the epicyclic type, was seen on the road for the first time in Saturday's Coventry and Warwickshire M.C. sidecar trial. Note the starting handle.

BIRMINGHAM CLUB'S ARDUOUS RIDE TO PERTH.

THE distance from Birmingham to Perth is 360 odd miles, which, in itself, constitutes a good ride, but when a gale of almost record severity is encountered for almost the whole distance dead in the riders' faces, then the trial becomes really severe.

Some competitors had difficulty in finding their way through Warrington, Wigan, and Preston, and it was also difficult to get petrol at that early hour in the morning.

Over Shap the roads were somewhat greasy, but there were no failures. From Carlisle the gale was too severe to be described; most of the competitors had many narrow escapes from being blown over. Crossing the bridge over Liddle Water, just after leaving Gretna Green, it was necessary to lean over at a considerable angle to maintain a balance against the wind!

From Beattock to Crawford the road winds through the mountains, and the flints blown up by the wind were particularly painful to one's face.

A peculiarity of the wind was that it came in gusts and quite upset the carburation, increasing the difficulty of driving tenfold. From Crawford the wind dropped slightly and competitors were able to make up lost time right into Perth.

Competitors were well looked after at the Royal George Hotel, Perth, and the Perth and District Club officials, who did the checking, also very kindly entertained the visitors and organised a walking party on the Sunday. The return journey was commenced at 3 a.m. on Monday. The wind was found to have changed round and was again in the competitors' faces; it commenced to rain at Stirling and continued to Kendal. The wind was stronger than ever between Crawford and Beattock and up Shap. At Kendal Duke and Brook were the two first arrivals, followed shortly by Newey and Sangster, all four of whom were just the three-quarters of an hour ahead of schedule time allowed. Ball, Pollock, and Pearson arrived just within the time limits. It appears that after leaving Perth troubles were many; Rowlandson had a seized small end on his connecting rod. Busby got lost near Stirling, as did Steeley and Egginton, who found themselves in Edinburgh. Peck had magneto trouble, and undertook a six mile walk into Carlisle. Seymour Smith was last seen in Lanark in trouble. H. D. Jones got lost, and came back *viâ* Edinburgh, but completed the journey by road to Birmingham, arriving about three-quarters of an hour late. Taylor and his machine were lifted bodily by the wind on Shap, and coming down to earth with a crash, the machine was damaged and had to be trained home. Blackwell had belt, magneto, and tyre trouble, his tyre being nearly cut in two at Warrington by a fallen slate. Yates was last seen at Kendal behind time. Mansell, whose Singer-Turner sidecar attracted much attention, ran out of petrol somewhere near Lanark.

From Kendal onward the roads were dry and the wind had dropped considerably. Duke (Zenith), Brook (water-cooled Precision), Newey and Sangster (Ariels), Ball (Triumph), and Arter (James) were the only competitors to arrive to schedule time.

Pollock and Pearson unfortunately had a smash when about 400 yards from the finish. It appears that Pearson's lamp was out and he ran into the back of Pollock's James; both riders came off, and Pearson sustained a cut head and broken collar bone. It is surmised that Pearson fell asleep on his machine.

Gold medals have been awarded to Messrs. Ball (Triumph), Brook (Precision), Duke (Zenith), Newey (Ariel), Pollock (James), and Sangster (Ariel) for completing the double journey.

Bronze medals have been awarded to the following: Blackwell, Busby, Egginton, H. D. Jones, Peck, Rowlandson, S. Smith, Steeley, Taylor, and B. Yates, for the single (outwards) journey.

The trial was very severe both for rider and machine. The chief trouble throughout was punctures. The only lady was Mrs. Yates in the sidecar of her husband's machine.

CURRENT CHAT

TIME TO LIGHT LAMPS.

April	18th	... ...	7.59 p.m.
,,	20th	... ...	8.2 ,,
,,	22nd	... ...	8.5 ,,
,,	24th	... ...	8.8 ,,

The Tourist Trophy Fund.

The fund to help defray the expenses of running the T.T. races now amounts to about £58.

Bristol Open Hill-climb.

For Saturday's open hill-climb of the new Bristol Motor Cycle Club, 120 entries have been received.

English-Dutch Trial.

Two further entries for the Dutch trial have come to hand, viz., C. Maurice Down (2¾ h.p. Enfield) in the private owners' lightweight section, and J. H. Slaughter (3½ h.p. L.M.C.) in the 500 c.c. trade class. Every class has filled, and some of the entries must be refused.

Easter Events.

It is worthy of record that last week's issue of *The Motor Cycle* was the only journal to include photographically illustrated reports of the following important holiday competitions:

(1.) M.C.C run to Land's End and back.
(2.) The Richmond meet of motor cyclists.
(3.) A.C.C.F. Circuit de Paris.
(4.) Brigsteer Brow hill-climb.
(5.) Brooklands Easter Monday racing.
(6.) Doncaster and District M.C.C. speed-judging competition.

THE JARROTT CUP WINNER.

Harold Karslake (3½ h.p. Rover) passing through Salisbury in the early hours *en route* for Land's End.

V. Olsson has now been removed from the Hounslow Hospital to a nursing home in London at 15, Welbeck Street, and is getting on well. He would like to thank the many M.C.C. riders and other friends who rendered assistance.

SPECIAL FEATURES.

How to Cheapen Running Expenses.
Oxford M.C.C. Open Hill-climb.
Liverpool A.C.C. Reliability Trial.
A Sidecar Trial.

Clashing of Dates.

The Birmingham M.C.C. applied for permission to hold an open passenger trial on May 18th as far back as December 30th last year, and on March 6th they obtained a promise of a permit from the A.C.U. It appears that the North-West London M.C.C. have also received a permit for a passenger trial from London to Coventry on the same day.

B.M.C.R.C. Meeting at Brooklands.

The second 1912 monthly meeting of the B.M.C.R.C. is down for Saturday next, and the entries are numerous. In the first 1912 time trial there are twenty-nine entries in the five classes. In the three-lap 500 c.c. scratch race there are nineteen entrants, five-lap cyclecar handicap eight, and in the one hour all-comers' race twenty-three.

A.C.U. Notes.

The time for practising for the T.T. races has been extended from 5 a.m. to 7 a.m. on the fourteen week days prior to the Junior T.T. on June 28th.

The re-run Spring one day trial will take place next Wednesday. The course, which is a secret one, will be about 150 miles in length, Oxford being the starting and finishing point.

COVENTRY & WARWICKSHIRE M.C. FIRST SIDECAR TRIAL. G. Smith (6 h.p. Enfield sidecar) churning the dust on Edge Hill, which gradient was ascended six times. G. Smith and W. H. Wells (7 h.p. Indian sidecar) tied for first place.

P. J. Brady (3½ h.p. Rudge) winner of the four miles handicap, and runner-up in the scratch race and the twenty miles handicap at Portmarnock last Saturday. (See Club News pages.)

More Records in the Air.

A. J. Moorhouse will shortly attempt the six hours and intermediate records at Brooklands on a 7 h.p. Indian.

Police Traps.

We have received information that a police trap is working between Cullompton (Devon) from the corner by the school to the end of the long straight stretch of road towards Wellington (Somerset).

Arms Hill Rendezvous.

After the Oxford M.C.C. hill-climb last Saturday several competitors and spectators journeyed the following day to Arms Hill, where attempts were made to get up. Riders of a Bradbury and a Scott were said to be successful in reaching the summit.

M.C.C. Team Trial.

A special permit has been granted to the Motor Cycling Club in connection with the team trial for *The Motor Cycle* fifty guinea challenge cup, on June 15th, which will render it unnecessary for competitors to hold an A.C.U. competition licence. A number of clubs have already notified their intention of competing.

Spanish Motor Cycle Race.

A Spaniard named Espinosa proved the winner of the motor cycle race between Bilbao and San Sebastian mentioned in the last issue. He was mounted on a Rudge Multi. Vernon Taylor, the only English competitor, says the riders rode into thick rain and fog when climbing the Pyrenees, and the race was a very hard one.

French Challenge to Motor Cyclists.

The reliability trial to be held by the Moto Cycle Club de France on May 12th is over a course which is said to have an excellent surface, and to be sufficiently hilly thoroughly to test the machines which will take part. Messrs. Pernette, Bac, and Guepperon have deposited £12 with the Club, and challenged any foreign team of three riders with engines between 350 and 500 c.c. Here is a chance for an English team to take up the glove. *The Motor Cycle* will forward letters addressed to the secretary of the M.C.C de France.

Single Figure Gradients.

As a result of our article on the above subject, we have been inundated with letters, some of which are of considerable interest, and will appear in these pages in due course. We should, however, like to point out that descriptions of bad hills (seldom given in contour books) are, though interesting, quite useless to us for publication unless particulars are given of the maximum gradient, length of hill, and total rise in feet.

Proposed Scottish Cyclists' Union.

A Scottish Motor Cyclists' Union is on the *tapis*. Representations have been made to the Scottish A.C., and every Scottish motor cycle club is advised to send a delegate or delegates to the Golden Lion Hotel, Stirling, on Saturday next, the 20th inst., when the preliminaries in connection with the formation of the proposed union will be discussed, and we hope the new organisation will meet with the success it deserves. Scottish motor cyclists have been rather backward in not forming an organisation of their own before now.

FUTURE EVENTS

April 20.—B.M.C.R.C. Race Meeting.
„ 20.—Bristol M.C.C. Open Hill-climb
„ 27.—Bristol B and M.C. Open Hill-climb
„ 27.—M.C.C. Open Silencer Trial.
May 4.—Coventry and Warwickshire M.C. Open Reliability Trial.
„ 4.—Mersey M.C. Open One-day Trial.
June 1.—Birmingham M.C.C. Open Hill-climb.

A special heading for competition announcements will be found at the end of the miscellaneous advertisement columns.

The M.C.C. London-Edinburgh and Back.

The route for the Whitsun run of the M.C.C. will be, after Newcastle-on-Tyne, the same as that used for the London-Edinburgh run of 1909, viz., *viâ* Alnwick, Berwick, Ayton, and Dunbar, but competitors will enter Edinburgh by a different road, so avoiding the unpleasant dusty ride from Levenhall. Several new trophies have been put up this year Mr. R. O. Clark offers a cup for sidecars, double journey; Mr. W. H. Wells another for sidecars, single journey; and Mr. S. H. Fry another for cyclecars, double journey. There will also be the usual single and return medals, the M.C.C. challenge cup, and a special cup for cars to be won outright, put up by Mr. C. Gordon Watson. Entry forms, rules, etc., will be posted to the members very shortly.

Secret Course Reliability Trial.

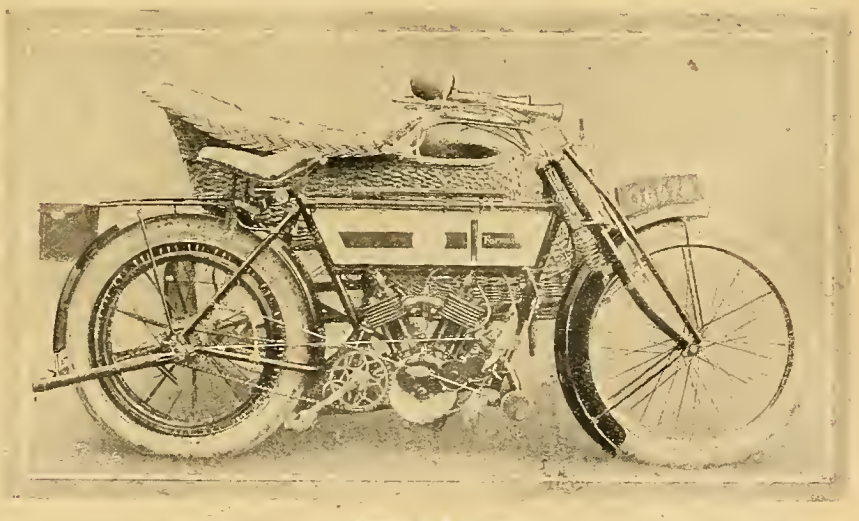
In connection with the Coventry and Warwickshire M.C. open reliability trial on May 4th, it has been decided to award a special prize for the best performance in Class A for lightweight motor cycles up to 350 c.c. in addition to the awards already enumerated Entries close on Monday next.

The Grand Prix of the A.C.C.F.

The Auto Cycle Club de France has decided to organise a 300 kilometres race on a specially guarded circuit of 20 to 25 kilometres in length. The actual course has not been chosen, but the date has been fixed for Sunday June 9th. The classes will be divided as follow:

Class 1.—250 c.c., weight 50 kilos, tyres 45 mm.

Class 2.—350 c.c. (singles), weight 55 kilos, tyres 45 mm.



Class 3.—350 c.c. (twins), weight 55 kilos, tyres 45 mm

Class 4.—500 c.c (singles), weight 60 kilos, tyres 55 mm.

Class 4.—600 c.c. (twins), weight 60 kilos, tyres 55 mm.

Belgian Motor Cycle Trial.

The following route has been mapped by the Motor Club Liègois for the two days' trial, May 26th and 27th: First day—Liège, Aywaille, Lierneux, Laroche, Bastogne (lunch), Neuchateau, Habay-la-Neuve, Florenville, and Bouillon (dinner and sleep). Second day—Bouillon, Libin, Dinant, Philippeville (lunch), Yvoir, Ciney, Hamoir, Aywaille, and Liège. As will be seen, this route embraces the prettiest scenery and best roads of the Belgian Ardennes.

A NEW 5-6 H.P. TWIN.

The Forward machine illustrated is a larger replica of the 2¾ h.p. Forward which has already won it The bore and stroke are 72 x 82 mm. It has interchangeable m.o.v., two silencers, gear-driven magn three-speed hub gear.

M.C.C. Run to Land's End and Back.

Official Results.

WINNER OF THE JARROTT CUP.

	Error from schedule.
Harold Karslake (3½ Rover)	0m. 52s.

WINNER OF THE LIGHTWEIGHT PRIZE.

P. W. Moffat (2¾ Douglas)	1m. 2s.

WINNER OF THE SIDECAR PRIZE.

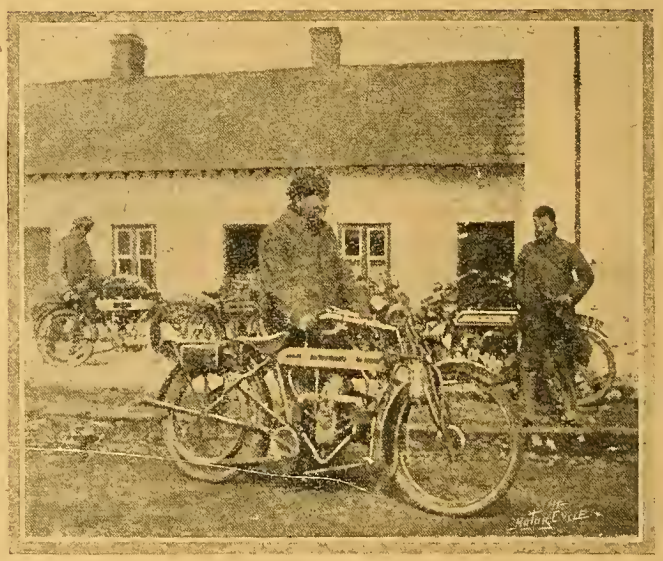
Frank Smith (Clyno and sc.)	2m. 27s.

GOLD MEDAL WINNERS.

P. Phillips (2¾ Douglas)	1m. 13s.
G. T. Gray (Rudge)	2m. 6s.
F. C. North (3½ Ariel)	2m. 16s.
H. Greaves (2¾ Enfield)	2m. 38s.
Hugh Gibson (3½ Bradbury and sc.) ...	2m. 41s.
R. Owen Wells (3½ Bradbury)	2m. 53s.
S. C. Tessier (8 Bat and sc.)	2m. 53s.
H. R. Whitmore (Rudge)	3m. 36s.
E. Gwynne (3½ Triumph)	3m. 49s.
A. J. Stevens (5 A.J.S. and sc.)	3m. 57s.
F. J. Watson (3½ Swift)	3m. 58s.
W. Pratt (3½ P. and M.)	4m. 8s.
Eli Clark (2¾ Douglas)	4m. 38s.
C. W. Meredith (Bradbury)	4m. 52s.
R. Charlesworth (3½ Zenith)	5m. 38s.
W. Cooper (Bradbury)	5m. 45s.
C. Bailey (Rudge)	6m. 4s.
S. C. Perryman (3½ Ariel)	8m. 47s.
A. J. Sproston (Rudge)	9m. 33s.
H. R. Slingo (5-6 Clyno and sc.)	9m. 58s.
P. H. Bentley (Triumph)	10m. 10s.
B. Alan Hill (7 Indian and sc.)	10m. 12s.
E. Pond (Rudge)	12m. 15s.
J. S. Holroyd (2½ Motosacoche)	14m. 7s.
S. Savage (Triumph)	14m. 35s.
F. W. V. Ehlvers (Triumph)	14m. 41s.

SILVER MEDAL WINNERS.

J. Milner (7 Indian)	7m. 49s.
J. R. Haswell (Triumph and sc.)	15m. 23s.
W. C. Hemy (Service-Precision)	15m. 33s.
H. Johnson (Triumph)	17m. 4s.
A. P. Maurice (3½ Premier)	18m. 23s.
W. Gibb (2¾ Douglas)	21m. 57s.
R. Croucher (3½ Kerry-Abingdon)	22m. 20s.
R. C. Davis (8 Chater-Lea and sc.) ...	23m. 8s.
J. Chater-Lea (8 Chater-Lea and sc.) ...	23m. 45s.
P. Grout (2¾ Douglas)	24m. 10s.
A. R. Abbott (3½ Bradbury)	28m. 2s.
R. Lord (6 Rex sidette)	37m. 29s.
E. B. Ware (8 Chater-Lea and sc.) ...	39m. 8s.
F. S. Proctor (7 Indian and sc.)	43m. 42s.
J. Stevens (2½ A.J.S.)	88m. 42s.



Disqualified for being more than fifteen minutes early.—N. O. Soresby (Rudge) and P. W. Tippett (3½ Humber).

J. Milner (Indian) only gets a silver medal, as he was over the time limit on the outward half.

The Penzance check on the outward trip was not taken into account, owing to the bull incident.

Sir R. K. Arbuthnot's 2m. 9s. error in 1910 was the previous best record.

P. Grout rode a 2¾ Douglas, as his Quadrant had not been delivered.

Open hill-climb at Knocksaughey, promoted by the Belfast and District M.C.C. J. Stewart (2¾ h.p. Douglas), who was second in the class for engines under 500 c.c., and best performance on a Lightweight. (See page 410.)

Results of the Circuit de Paris.

THE Auto Cycle Club of France is a young body, yet it organised the Circuit de Paris extremely well. The direction arrows were splendidly conspicuous, being four times the size of those used by the A.C.U. The name of the club was printed right way up on the top and upside down underneath, so that the arrows could be used to show either way. At any one of the two points where an arrow was missing the New Hudson sidecar occupants, who distributed leaflets in all directions, placed a little heap of these by the roadside to guide the other competitors. The A.C.C.F. seals were also different from ours. They were made of light metal, which was clamped over the wire by a special pair of pliers. They were not only one-tenth the weight of lead seals, but they were absolutely secure.

Besides the English machines it will be seen that the following well-known makes on the French side lost no marks: Class II.—N.S.U., New Hudson (entered by the Paris agents), and Motosacoche; Class III.—Peugeot, N.S.U. (⅗s. behind first), two Motosacoches, two Clément, and a Griffon. It may be thought that the trial was no test, merely a free and easy blind. Far from it. The awful *pavé* encountered at frequent intervals, the speed itself, and the long hills met with near Chateau-Thierry and Vernon made the trial by no means too easy. The way the majority of the machines stood up was very gratifying.

The positions of those who were not penalised were decided on the results of the timed hill-climb at Montauglaust. The figures after the first in each class indicate the number of seconds slower than the first.

CLASS II. (Full marks).

	Rider and machine.	c.c.	sec.
1.	Poulain (1 cyl. N.S.U.)	296 ...	0
2.	Rousseau (1 cyl. New Hudson) ...	292 ...	7
3.	Millaud (1 cyl. Motosacoche) ...	298 ...	46

CLASS III. (Full marks).

1.	Peau (2 cyl. Peugeot)	332 ...	0
2.	Paul (2 cyl. N.S.U.)	322 ...	⅗
3.	Lacroix (2 cyl. Peugeot)	332 ...	4⅘
4.	R. Bishop (2 cyl. Enfield)	343 ...	5⅘
5.	Deway (2 cyl. Clément)	343 ...	6
	G. L. Fletcher (2 cyl. Douglas) ...	340 ...	6
7.	B. Dacier (2 cyl. Clément)	345 ..	12⅕
8.	Brunet (Griffon)	— ...	20⅘
9.	Münch (Motosacoche)	— ...	30
10.	Bondini Motosacoche)	— ...	45⅘

CLASS IV. (Full marks).

1.	H. Lister Cooper (1 cyl. Triumph)	499 ..	0
2.	Pernette (1 cyl. Française)	482 ..	1⅕

AMATEUR CLASS (Full marks).

1.	W. G. McMinnies (1 cyl. Triumph)	499 ..	
2.	T. Tillman	— ..	
3.	G. Griffiths (1 cyl. Rudge) ...	499 ...	

AMATEUR CLASS (Penalised).

4.	E. M. P. Boileau (2 cyl. Douglas) ...	50 marks
5.	A. W. Heighton (Matchless)	57 ,,
6.	Tatin	76 ,,

The voiturettes Bedelia and Cohendet lost no marks.

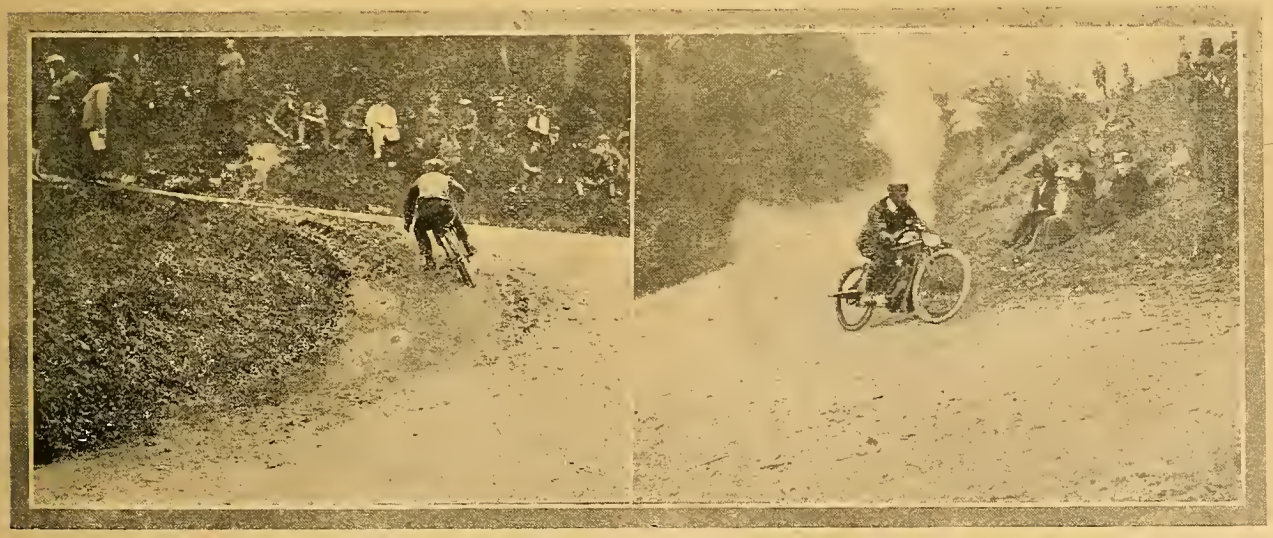
OXFORD M.C.C. OPEN HILL-CLIMB.

AN EVENTFUL DAY'S SPORT.

THE venue of the Oxford Motor Cycling Club open hill-climb on Saturday last was thought by many to be the famous Kop Hill, particularly as competitors were requested to assemble at Princes Risborough. However, the Oxford M.C.C. officials had a surprise in store for the riders, in the shape of a test much superior to Kop in a hill locally known as Pink Hill. This is situate about threequarters of a mile from the hitherto famous Kop, both being on the Chiltern Range. Pink Hill is about three-quarters of a mile in length, and commences with a third of a mile of fairly easy gradient. At the end of this section there is an extremely sharp turn to the left on a gradient of 1 in 5 (surveyed for the Oxford M.C.C.); from this point to the summit the incline varies from 1 in 9 to 1 in 6. It was on a section of 1 in 9 that the stopping and restarting test was held; competitors on variably-geared machines had to stop between two lines thirty feet apart, and restart while seated in the saddle.

The weighing of the bicycles took place at the hill foot, under the superintendence of Mr. H. P. Beasley, and the sidecars and cyclecars were weighed at Risborough Station. At the scales only one machine was finally rejected, viz., G. Griffiths' 2 h.p. Alcyon, entered for the Junior T.T. class, as it had only one brake. One or two entrants in Class VII. up to 150 lbs. weight had to remove a few superfluous spares, etc., to bring their mounts within the prescribed limit. The record weight for a motor bicycle, which had been heavily laden with lead to come out well on the formula, was 290 lbs.—its real weight was about 100 lbs. less. Rupert May easily topped the list of riders' weights, but, notwithstanding his bulk and avoirdupois, he made two perfectly clean ascents, including the wicked corner.

Several Disqualifications.



The club officials are to be congratulated on the good marshalling and the promptness with which the start was made. Sharp at 1 p.m. P. Weatherilt (Zenith) rode up the hill in the Junior T.T. class, and, with the aid of his Gradua gear, got safely round the corner, where, of course, most of the spectators had assembled, anticipating some excitement in the form of tumbles. There was little danger of serious falls, as the turning was so acute and on such a steep grade that every one cut out when approaching it, and the slightest error of judgment meant a tumble at comparatively slow speed. "Legging" was indulged in by some competitors, who would have failed had they not used this method of assisting their engines to pick up after the corner was passed. However, the officials ruled that putting out one foot to save a spill was permissible, but obvious "legging" was not, and they disqualified several who would otherwise have been well placed.

Scene at the starting line.

Of the Junior T.T. riders, Ayres (Singer) rode in place of G. E. Stanley. The latter told us he took exception to the selection of a hill with such a bad corner for a hill-climbing contest, and preferred to stand down. W. W. Douglas (Douglas) made a very fine ascent, changing down for the corner and up again as soon as he got round. There were two or three failures and a dead heat between Weatherilt and Newman (Ivy-Precision).

The sidecars were expected to provide some excitement, as the turning was a left-hand one and towards the sidecar. F. W. Barnes (6 Zenith) was first up, the wrench at the corner causing the driving tyre to leave the rim. Barnes went on unconcernedly on the rim, and in a later try made fastest time. The spectators raised a cheer when H. G. Dixon and his passenger in the New Hudson took the corner, the passenger assuming a position that can best be compared with the outrigger of a skiff. The sidecar wheel

Two aspects of the left-hand bend of Pink Hill, Princes Risborough. The riders are R. Holloway (left) and A. J. Moorhouse (right).

F. C. North (3½ h.p. three-speed Ariel) awaiting the signal to restart in the variable gear class.

of A. James's Clyno just lifted, but luckily the machine righted itself immediately.

The T.T. class for machines up to 500 c.c. proved as popular as ever; there were 25 entries, and 20 rode. The severity of the corner will be evident when we point out that two of the most skilful trade riders fell, and others only just grazed round.

Everyone appeared greatly interested in the cyclecars—two G.W.K.'s and a Morgan. The former looked very neat and workmanlike, and the one entered by J. T. Wood carried a by no means lightweight passenger. The speed capabilities of the Morgan are so well known that it will be no surprise to hear that it was the fastest in its class.

The principal awards in the single-geared tourist single-cylinder class were on formula, there being only one time prize, which was won by H. C. Newman in the fast time of 56⅘s. Newman and his Precision engined Ivy were thus responsible for two firsts on time. S. Crawley (Triumph) was a good second, being only two seconds slower: four fell at the corner, including one or two who had previously got round in other classes.

Three-speeders Score.

In the variably-geared class all but one succeeded in the stopping and restarting test, and this was, to our mind, most instructive. Each competitor was kept 30 seconds between the lines, which is indeed a good test, but rather long. Three classes followed this event; touring twins, touring machines up to 150 lbs., and any single or twin up to 1,000 c.c.

Of the touring twins three Enfields were first, second, and third on time, ridden by Greaves, Colver, and Viggers. Riddell (Blumfield) would have been second, but was disqualified for "legging." Alan Hill couldn't quite get round the corner on the big Indian, but he had a good try.

Miss Hind was the only lady competitor, and she very pluckily brought out her 6 h.p. Rex, to meet with failure at the corner, which was the Waterloo of several in the all comers' class. Even the redoubtable Barnes came down, Griffiths' Alcyon caught fire at the carburetter after he had fallen, G. F. Cooper picked up his Triumph with the engine running, and as the rear wheel touched the ground away went the machine, and again it fell. A. Moorhouse (7 h.p. Indian) made the fastest time of the day—53⅗s.—but he was disqualified, and this let up E. W. Cheshire (Triumph) into first place on time; incidentally, this was the fastest single-cylinder time of the day.

The formula used was Professor Callender's well-known one, adopted by the A.C.U., and Mr. A. Sharp, who, with Mr. Brooker, acted as judge, was responsible for the calculations. Messrs. W. A. Matthews (hon. sec.), F. C. Barton (trials hon. sec.), and a host of willing helpers worked hard and were rewarded by a successful and eventful meeting. The timekeepers were Messrs. F. T. Bidlake and F. Straight.

Results on Time.

The following are the official results on time. Those marked * were disqualified for assisting the machine with their feet at the corner:

Class I.—Junior T.T. up to 350 c.c.

		M.	S.
1.	W. W. Douglas (2¾ Douglas)	1	4⅖
2.	P. Weatherilt (2¾ Zenith)	1	4⅗
	H. C. Newman (2½ Ivy Precision) ...	1	4⅗
4.	H. Berwick (2¾ New Hudson)	1	9
5.	A. G. Fenn (2¾ Humber)	1	13
	*H. G. Dixon (2¾ New Hudson)	1	9⅗

Class IX.—Touring sidecars up to 1,000 c.c.

1.	F. W. Barnes (6 Zenith, Gradua gear) ...	1	8⅕
2.	H. G. Dixon (3½ New Hudson, Armstrong gear)	1	23⅖
3.	R. C. Davis (8 Chater-Lea, Chater gear)	1	35⅖

Class II.—T.T. machines up to 500 c.c.

1.	H. G. Dixon (3½ New Hudson)		59
2.	W. F. Newsome (3½ Triumph)	1	1⅕
3.	E. V. Pratt (3½ Ivy Precision)	1	1⅘
4.	P. Weatherilt (3½ Zenith)	1	6
	*R. Holloway (3½ Premier)		59
	*S. D. Timson (3½ Rudge)	1	5⅗

Class X.—Touring cyclecars up to 1,000 c.c.

1.	H. F. S. Morgan (8 Morgan)	1	37⅘
2.	J. T. Wood (8 G.W.K.)	1	45⅕
3.	C. M. Keiller (8 G.W.K.)	1	52⅗

Class III.—Single-geared touring single-cylinders.

1.	H. C. Newman (3½ Ivy Precision) ...		56⅘
2.	S. Crawley (3½ Triumph)		58⅘
3.	J. W. Tolladay (3½ Triumph)	1	0
4.	J. H. Pountney (3½ Rover)	1	3⅖
5.	S. R. Cooke (3½ Rudge)	1	5⅖
6.	J. Cocker (2½ Singer)	1	6⅖

Class V.—Variably-geared touring single-cylinders.

1.	F. C. North (3½ Ariel, Armstrong gear)	1	47
2.	H. Berwick (3½ New Hudson, Armstrong gear)	1	47⅗
3.	P. Weatherilt (3½ Zenith, Gradua gear)	1	48⅕
4.	F. W. Barnes (2¾ Zenith, Gradua gear)	1	56
5.	N. A. Ayres (4 Singer, Singer gear) ...	2	0⅕

Class IV.—Single-geared touring twin-cylinders.

1.	H. Greaves (2¾ Enfield)	1	7⅘
2.	H. V. Colver (2¾ Enfield)	1	16⅖
3.	R. Viggers (2¾ Enfield)		
	*H. Riddell (4-5 Blumfield)	1	8

W. A. Dait (Bradbury) scatters the spectators by running into the bank in the variable gear class.

Oxford M.C.C. Open Hill-climb.—

CLASS VII.—Standard touring machines up to 150 lbs.

		M.	S.
1.	H. C. Newman (2½ Ivy-Precision) ...	1	2 2/5
2.	J. Cocker (2½ Singer)	1	5 4/5
3.	H. Greaves (2¾ Enfield)	1	7
4.	H. V. Colver (2¾ Enfield)	1	12 3/5
5.	G. Bell (2¾ New Hudson)	1	17 4/5
6.	R. Viggers (2¾ Enfield)	1	18 3/5

CLASS VIII.—Any single or twin up to 1,000 c.c.

1.	E. W. Cheshire (3½ Triumph)		56 2/5
2.	H. S. Askew (5 Bat)		58 4/5
3.	R. Holloway (3½ Premier)	1	0 4/5
4.	S. R. Cooke (3½ Rudge)	1	1 4/5
5.	Hal Hill (5 Bat)	1	2 1/5
6.	P. Weatherilt (2¾ Zenith)	1	3 2/5
	*A. Moorhouse (7 Indian)		53 3/5
	*W. F. Newsome (3½ Triumph)		69 2/5

Formula Results.

CLASS IX.—Sidecars up to 1,000 c.c.

		Fig. of Merit.	Award.
1.	H. Graham Dixon (3½ New-Hudson)	69	Gold medal
2.	F. W. Barnes (8 Zenith)	106	
3.	A. James (5-6 Clyno)	108	

CLASS X.—Cyclecars.

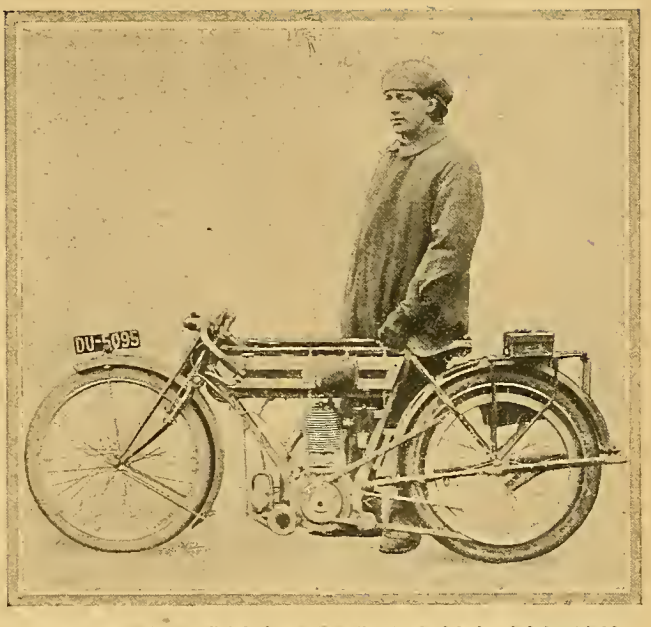
1.	C. M. Keiller (8 G.W.K.)	98	Gold medal
2.	J. T. Wood (8 G.W.K.)	102	
3.	H. F. S. Morgan (8 Morgan) ...		

CLASS III.—Single-geared Touring Single-cylinders.

1.	J. Cocker (2½ Singer)	67	Gold medal
2.	Rupert May (3½ Triumph)	82	Silver medal
3.	H. C. Newman (3½ Ivy Precision) ...	84	Bronze medal

R. Holloway (3½ h.p. T.T. Premier), who tied with H. G. Dixon on time in Class II., but was disqualified.

CLASS IV.—Single-geared Touring Twin-cylinders.



1.	H. Greaves (2¾ Enfield)	86	Gold medal
2.	H. V. Colver (2¾ Enfield)	90	
3.	R. Viggers (2¾ Enfield)	101	

CLASS V.—Variably-geared Touring Single-cylinders.

1.	F. W. Barnes (2¾ Zenith)	102	Gold medal
2.	J. Cocker (2½ Singer)	123	Silver medal
3.	F. C. North (3½ Ariel)	148	

CLASS VII.—Touring Machines up to 150 lbs. weight.

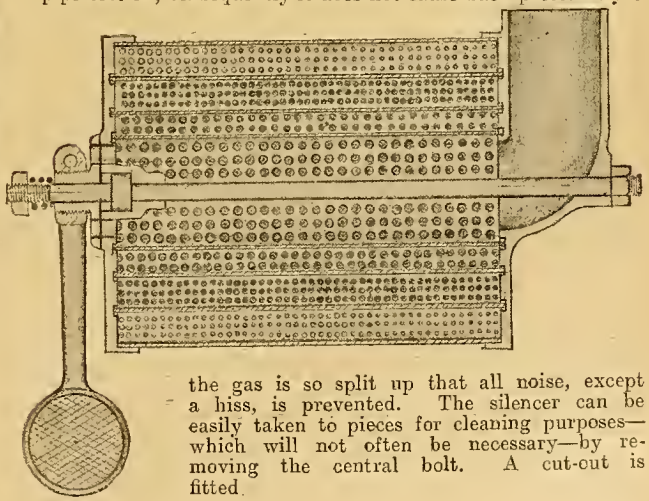
1.	J. Cocker (2½ Singer)	66	Gold medal
2.	R. Holloway (2½ Premier)	70	Silver medal
3.	H. G. Hill (2½ Calcott)	71	

A new racing frame, slightly longer than the standard design, is being tried by the Triumph Co., and those who have ridden it pronounce it a great improvement E. W. Cheshire, the rider in the illustration, used it at Pink Hill.

CLASS VIII.—Any Single or Twin up to 1,000.

1.	P. Weatherilt (2¾ Zenith)	59	Gold medal
2.	H. G. Dixon (2¾ New-Hudson) / H. Berwick (2¾ New-Hudson)	64	Silver medal / Bronze medal

A.C.U. ONE-DAY TRIAL.



The following entries have been received for the Day Trial :

F. A. McNab (3½ Trump)
J. Slaughter (3½ L.M.C.)
R. R. Rothwell (4 Scott)
R. Mundy (Singer)
W. E. Rootes (3½ Singer)
F. Smith (Clyno sc.)
R. E. Guest (8 Matchless sc.)
J. H. Kerr (3½ N.S.U.)
H. A. Collier 8 Matchless sc.)
S. T. Tessier (8 Bat sc.)
J. Chater-Lea (8 Chater sc.)
P. W. Bischoff
F. Dover (3½ Premier)
F. W. Applebee (2¾ Centaur)
W. E. Cook (3½ A.S.L.)

Late entries will be accepted up to Friday (to-morrow).

NEW BINKS SILENCER.

We illustrate herewith the latest pattern silencer from the Phœnix Works, Eccles. It consists of concentric cylinders drilled with a large number of holes, the holes being smaller in the outer cylinders, but more numerous. The total area of these small holes is much greater than the area of the exhaust pipe section, consequently it does not cause back pressure, yet

the gas is so split up that all noise, except a hiss, is prevented. The silencer can be easily taken to pieces for cleaning purposes—which will not often be necessary—by removing the central bolt. A cut-out is fitted.

Liverpool Reliability Trial in North Wales.

At the start of the Liverpool A.C.C. open trial. Mrs. and Miss Baxter in the foreground.

THE Liverpool A.C.C. open non-stop reliability trial proved an important event, as some sixty competitors turned out. A start was made from Hamilton Square, Birkenhead, at 9 a.m. The riders went off smartly in pairs; several well-known men figured on the card, consequently a large crowd watched the proceedings with interest. Few made non-stop runs, though fifty-three survived the course. The gold medal winners were:

F. G. Edmond (3½ Humber)
*F. Rees (3½ Rudge)
J. C. Smyth (6 Matchless)
*F. Dover (3½ Premier)
C. T. Newsome (3½ Rover)
D. H. Noble (3½ Rover)
J. Haslam (6 Zenith)
N. H. Brown (7 Indian)
*G. A. Gregson (3½ Bradbury)
R. Mundy (3½ Singer)
F. Smith (5·6 Clyno)

The remaining competitors were:

*T. W. Harley (2¾ Douglas)
S. W. Phillpott (2¾ Humber)
W. Heaton (2½ A.J.S.)
*C. Hobbs (2¾ Humber)
*F. G. Pierson (2½ Levis)
F. C. Jones (2½ Singer)
*A. S. Lloyd (3½ Triumph)
C. L. Scott (3½ Rudge)
*W. de Jongh (3½ Rudge)
*L. Mogridge (3½ Mead-Precision)
*C. Murdoch (3½ Singer)
*F. W. Sixsmith (3¾ Scott)
*N. C. Schafer (3½ Humber)
E. F. Jenkins (3½ Macbeth)
*M. Glasgow (3½ Triumph)
H. C. Marston (3½ Rudge)
*P. P. Syrret (6 Matchless)
R. Lord (6 Rex)
*W. E. Coates (3½ Rudge)
*Harry Webb (3½ Premier)
A. J. Jenkins (3½ Macbeth)
*J. H. Fox (3½ Rudge)
*Miss N. Baxter (3½ Rex)
*G. Castognoli (3½ L.M.C.)
*T. Pollard (3½ Triumph)
W. Jones (3½ Rudge)
*V. Horsman (3½ Singer)
*Mrs. L. M. Baxter (3½ Rex)
*Jesse Baker (3¾ Scott)
*E. F. Baxter (6 Rex)
G. Wray (3½ Bradbury)
*H. E. Ashley (3½ L.M.C.)
*A. A. Jaffa (7 Indian)
*J. Lamb (3½ Bradbury)
R. Bielby (3½ Rover)
H. Gibson (3½ Bradbury)
*H. W. Coopland (5 A.J.S.)
*R. Holford Jones (3¾ Scott)
*E. Longden (8 Dot)
*C. Coddington (6 Enfield)

*Private owners.

Eric Longden had besides his passenger a fox terrier which went all through the trial. The course, part of which was covered in the last trial, was called severe, loose stones caused punctures and other troubles, and the riders were early in difficulties. R. Bielby, on a Rover, had a skid on the wet tram-lines leaving Eastham, and charged a hedge at Rossett, where the first hill of note was encountered. About fifty yards of this, near the top, was covered with loose stones from side to side, but there were only a couple of failures. From here to Cefn-y-Bedd and Llangollen nothing of interest was recorded.

On dropping down the valley, after a dust-up on the level for several miles, the riders were confronted with the worst hill of the day—Bwlch Hill, or the Horse Shoe. Cilcain proved easy to it; some exciting incidents were witnessed here. Hugh Gibson, on a chain driven two-speed Bradbury and sidecar, got halfway up when snap went the driving chain; the machine shot down the hill backwards and charged the bank. A badly bent sidecar axle was the extent of the damage; this was put fairly straight, and a return made to the bottom of the hill. Gibson then had another try which was successful. This was his only stop. Many riders gave up when they began jumping the awful watercourses or gullies which ran right across the road

Frank Smith (Clyno sidecar) climbing the Horseshoe Hill with ease. He is passing stranded competitors.

Some fortunate and unfortunate competitors on Rossett Hill.

at short intervals. Not more than six riders got to the top at the first attempt. Two-speed gears seemed to be of no avail. The riders didn't seem to care for the risk of a tumble down the side of the hill. Frank Smith, on the Clyno, did the best performance, and might have been sauntering along a level road without bustle or fearful swerves. G. Wray, on a Bradbury two-speed gear (his own design), glided over the hill in the same cool way as Frank Smith.

Cilcain Hill.

From this point Ruthin was the next destination, where a halt of one hour was called for lunch. Many riders were late, so they were despatched in any order when their hour's stay was up. Cilcain, the trick hill of the course, was next, and here a great crowd awaited the riders. Nearly all got up. J. Baker on a Scott went up without a swerve. N. C. Schafer on a two-speed 3½ h.p. Humber made a wonderful recovery; at the corner he hit the grass hump, wobbled badly, righted himself, opened his jammed throttle and sailed up. E. Coates (Rudge) went up without cutting out. Of the sidecars, Longden (Dot) stopped near the top, but his engine still kept going; H. W. Coopland (5 h.p. A.J.S.), very good; Frank Smith, (Clyno) very easy. Hugh Gibson (Bradbury) rushed to the bend all out, tore round the corner, pulling his right handle-bar with both hands, did a mighty skid, and was up and out of sight before people had got over thinking what a fearful smash there would be. Mrs. and Miss Baxter (3½ Rexes) went as far as they could without undue risks, and walked to the top with engines still running. F. C. Jones (2½ Singer), a very burly rider, had two tries and got up, paddling both feet on the ground in such a funny manner that everybody roared with laughter.

Newmarket Hill, a long, winding, narrow road with stretches of new stones, caused a few more failures, as, owing to the slow running of engines on account of the bad bends, many "konked" to a standstill through overheating. E. F. Baxter (6 Rex) spoiled his non-stop record by hitting the bank and rebounding on loose stones and falling off. W. Heaton (2½ A.J.S.) accidentally turned his petrol tap off, and consequently stopped.

The Final Stage.

From Newmarket Hill to the control at Northop (tea) was easy, and the last stage of thirty-two miles was very quickly over.

There were very few non-stops, and up to 7 p.m. many riders had not turned up. G. Wray (Bradbury), J. Baker (Scott), F. Smith (Clyno), Gregson (Bradbury) were some of the non-stoppists; the last named went through very well. The minimum speed was 15 m.p.h., no restriction otherwise. The weather was perfect, no wind, not much dust, and a very enjoyable time was spent by all the riders. The route was very well marked. Some fifty motor scouts were placed at the disposal of the club and lent great assistance in showing the riders the turns, especially in the narrow byways off the main roads.

Mrs. Baxter walks up Cilcain Hill with the engine running.

CLUB NEWS.

Blackburn and District M.C.C.

The members' hill-climb which was to have taken place recently was postponed owing to fog.

Hampstead C. and M.C.C.

The first run of the season will be held on Saturday next, the 20th inst., starting from headquarters, Jack Straw's Castle, at 4 p.m., for Dunstable, tea at the Saracen's Head. Motor cyclists are invited to attend.

Surrey M.C.C.

A members' hill-climb will be held on Wednesday, the 24th inst. Entries will be received up to Saturday, the 20th inst. Six classes will be arranged, each subject to a minimum of three entries.

Bristol B. and M.C.

The club will be holding an open hill-climb on the 27th inst. There will be nine events, including one for amateurs only. Entry forms can be obtained from Mr. H. Blocksidge, 14, Frederick Place, Clifton.

Walthamstow M.C.

A non-stop and speed-judging competition was held on the Cambridge Road on the 13th inst. Competitors had to ride at a set speed of 18 m.p.h., watches and speed indicators being barred. The results were as follows: 1st, G. West (5 h.p. A.C.), 21⅘s. slow; 2nd, A. G. Peppercorn (3½ h.p. Bradbury), 3m. 50⅘s. slow; 3rd, J. Kerr (3½ h.p. N.S.U.), 4m. 13s. fast.

Mersey M.C.

There will be a team trial on the 21st inst. *viâ* Mold, Ruthin, Bala (lunch), Corwen, Wrexham, and Chester. The committee trust that as many members as possible will turn up, as they wish to select from the competitors a team to represent the club on June 15th in the team trials to be held in the Midlands by the Motor Cycling Club for *The Motor Cycle* Challenge Cup.

Glasgow M.C.C.

The sudden death of Mr. W. M. Branston left the Glasgow Club without a secretary, but a new hon. sec. and treasurer has now been appointed in Mr. Geo. H. Cutbush, Blanefield, near Glasgow. The club's membership continues to increase at a very satisfactory rate, and a big entry is expected for the open spring hill-climb, which is to be held on May 4th on a new hill.

Cork and District M.C.C.

The Pohlmann Cup Competition, Killarney to Cork, *via* Kenmare and Glengarriff, took place on Easter Monday. The roads for the greater part of the journey were rough and twisty, and four mountain passes had to be climbed. A gale of wind made the competitors' task all the more difficult. The following tied for first place, without loss of marks: W. J. O'Mahony (7 h.p. Indian sc.), W. J. O'Callaghan (3½ h.p. Zenith sc.), B. H. Clibborn (3½ h.p. Triumph), P. A. Egan (3½ h.p. Bradbury), L. Dobbin (8 h.p. Matchless), and R. S. Russell (3½ h.p. Matchless). The tie is to be run off on a secret course without the aid of speedometers or watches.

South Birmingham M.C.C.

The first members' hill-climb will be held on the 20th inst. The membership now totals ninety-five.

Sutton Coldfield and Mid-Warwickshire A.C.

The opening run of the season took place on the 13th inst. The course took the competitors into the heart of Shakespeare's country, and the run concluded at the Abbey Hotel, Kenilworth. A speed-judging competition was arranged, and the results were as follows: 1, Seymour Smith (Humber car), gold medal; 2, A. Butterfield (Levis motor cycle), silver medal; 3, W. H. Sheldon (Regal Precision) and F. P. Mayell (T.T. Triumph) tied.

The open amateur hill-climb will be held on May 18th. Trade riders and those who have won first prizes in open hill-climbs will be excluded.

North Staffordshire M.C.C.

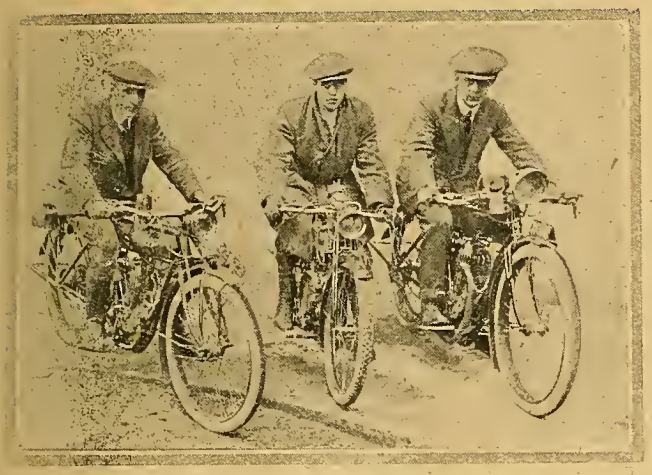
The route for the first reliability trial for the Ashton Cup lay through Newcastle, Stoke, Leek, Ashbourne, Uttoxeter, Stafford, Whitmore (where lunch was taken), Market Drayton, Audlem, Nantwich, Newcastle, back to Whitmore. The following finished: T. F. Rogers (8 h.p. Morgan) and W. E. Baines (3½ h.p. Triumph) tied for the first place, with 100 marks each; 3, J. A. Prendergast (3½ h.p. Rudge), 97½ marks; 4, G. Tagg (3½ h.p. Triumph), 95 marks; 5, T. W. Waring (3½ h.p. Triumph), 93½ marks; 6, H. W. Teeton (5 h.p. twin Kerry), 69 marks; 7, C. E. Fowke (5 h.p. A.J.S.), with passenger and sidecar, 61 marks.

Dublin and District M.C.C.

On Saturday last the Dublin and District Motor Cycle Club opened its speed season with a race meeting at the Velvet Strand, Portmarnock, a venue that, for the past nine years, has provided excellent testing ground for Irish motor cyclists. After a week of calm weather the going was in good order, and, with a practically still atmosphere, some fast times were put up during the afternoon. C. B. Franklin won both the scratch races, the distance in each instance being one mile. In the class for machines under 520 c.c. his time was 1m. 10⅘s on his 3½ h.p. single-cylinder Indian, and, riding the same machine in the unlimited class, he did 1m. 8⅘s. P. J. Brady, who was second to Franklin in the limited scratch race, won the four miles handicap from the scratch mark on his 3½ h.p. Rudge, and in the twenty miles he put up a fine fight against W. Curtis (Indian), both starting from the same mark and being divided by 8s. at the finish. Details:

Mile Scratch (under 520 c.c.)—1, C. B. Franklin (3½ h.p. Indian); 2, P. J. Brady (3½ h.p. Rudge); 3, W. Curtis (3½ h.p. Indian). Won easily in 1m. 10⅘s.

Mile Scratch (unlimited).—1, Franklin; 2, Curtis; 3, Brady. Winner's time, 1m. 8⅘s.



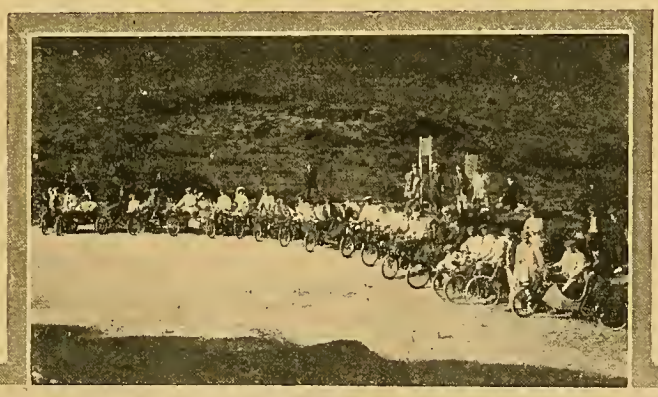
Four Miles Handicap.—1, P. J. Brady (3½ h.p. Rudge), 12s. start; 2, W. Beattie (3½ h.p. Rudge), 14s.; 3, W. Curtis (Indian), 12s.; 4, T. Greene (3½ h.p. Rudge), 15s. Time, 5m. 15⅘s.

Twenty Miles Handicap.—1, W. Curtis (Indian), 1m. 40s. start; 2, P. J. Brady (3½ h.p. Rudge), 1m. 40s.; 3, W. Beattie (3½ h.p. Rudge), 1m. 50s.; 4, J. Healy (3½ h.p. Rudge), 2m.; 5, C. B. Franklin (3½ h.p. Indian), scratch. Time, 21m. 25s.

Bradford-on-Avon and District M.C.C. members assembled outside their headquarters for the opening run.

A TRIO OF EDINBURGH MOTOR CYCLISTS AT BRIGSTEER BROW.

J. R. Alexander (5 h.p. Indian), J. Steele (2¾ h.p. two-speed T.T. Douglas), and A. H. Alexander (7 h.p. Indian). They all travelled by road to the hill-climb.



Cornwall M.C.C.

This club held its reliability run, Penzance-Exeter-Penzance, on the 30th ult. The outward journey was *via* Truro, Bodmin, Launceston, Tavistock, Two Bridges, and Moreton Hampstead. Out of twenty-six starters, twenty arrived well on time at the Bude Hotel, Exeter. The homeward route was Chudleigh, Ashburton, Holne Chase, Poundsgate, Two Bridges, Tavistock, Callington, Liskeard, Lostwithiel, Truro, and Penzance. Only ten completed the course before midnight, three arriving at 12.30. Results:

1 (silver cup). T. Rayner (8 Zenith-Gradua).
2 (gold medal). W. Tresidder (3½ Triumph).
3 (silver medal). F. G. Wheller (3½ Bradbury 2-sp.)
4 (bronze medal). R. W. Williamson (3½ T.T. Norton).
5 (bronze medal). H. Williamson (3½ P. and M.)
6 (bronze medal). M. Vacy Ash (3½ Triumph).

Great sympathy was expressed with Mr. Raine, the donor of the cup, who was riding a 3½ h.p. Scott, at his having met with an accident on the tramlines between Camborne and Redruth on the outward journey.

GATHERING OF SIDECARISTS AT THE FIRST HILL-CLIMB FOR SIDECARS HELD BY THE CAPE PENINSULA M.C.C.

Sidney Jones about to take a corner in racing fashion on his 3½ h.p. Triumph. He proved to be the winner.

G. Turner "all out" to the Nek. He secured second place on his 6 h.p. Enfield.

Merionethshire M.C.C.

At a meeting held at Bala on the 4th inst. it was decided to form a club with the above title.

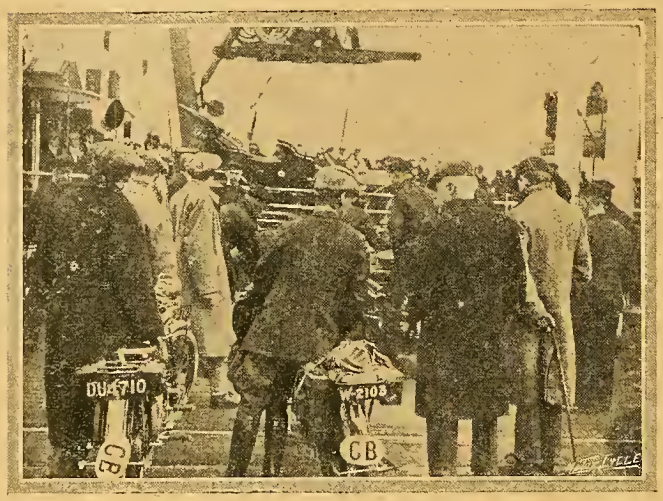
Western District M.C. (London).

On the 21st inst. the postponed reliability trial for the N.S.U. gold medal takes place. The distance to be covered is 104 miles, lunch and control being at Oxford. The outward journey of forty-eight miles and the return trip of fifty-six miles are to be made without a stop. The winner will be he who makes non-stop runs and is nearest to the schedule time on arrival back. The start and finish of the trial is from Ealing Common at 10 a.m. and 5 p.m. respectively.

Lincolnshire A.C. (Motor Cycle Section).

Results of the members' hill-climb held Easter Monday afternoon at Station Hill, Leadenham, the course being a quarter of a mile in length and the surface in good condition.

			Position on formula.
CLASS I.—Up to 600 c.c.			
1.	J. H. Brookes (3½ Rudge) ...	20⅕s. ...	133
2.	J. E. Harston (4 Campion-Jap)	22⅖s. ...	145
3.	W. Deane (4 Zenith)	24s. ...	149
4.	W. J. S. Bament (3½ Rudge)	21⅘s. ...	150
5.	R. H. North (3½ Rudge) ...	24⅕s. ...	150
6.	A. B. Goold (3½ Rudge) ...	22⅕s. ...	152
CLASS II.—Over 600 c.c.			
1.	L. W. Forington (6 Bat-Jap)	18⅘s. ...	172
2.	A. W. Grocock (6 Zenith) ...	21s. ...	197



The Wright Challenge Vase for the best performance of the day was awarded to J. H. Brookes.

North-west London M.C.C.

A permit has been obtained from the A.C.U. for an open twelve hours' reliability trial—London, Coventry and back—by the above mentioned club, to take place on Saturday, May 18th, for passenger machines only. In connection with this competition there will also be an inter-club competition for teams of four passenger machines, the component members of which shall also be entrants for the open individual competition. The trial is being organised for the purpose of forming a contrast between the merits of the different cyclecars, and also a further comparison between these machines and sidecar machines, and, as such, should be very interesting. The start will be at 7 a.m. from Hampstead.

A Competitor's View of the Circuit de Paris.

LET me begin from the beginning, and express my thanks to the R.A.C. and A.C.U. for every effort they made towards helping us on our journey. As regards train accommodation, a saloon was provided for the outward journey, and two reserved compartments were provided on the way home.

British competitors in the A.C.C.F. Circuit de Paris about to embark for Boulogne from Folkestone.

The fact that nine of the competitors were left to their own devices was purely an accident, as the ever hospitable and kindly members of the A.C.C.F. were at the Gare du Nord to meet them, but these nine men who came by the second of the two trains from Boulogne never thought of looking for their friends at the barrier, but went direct to the Customs House, and so missed the very men who were on the spot to look after their interests.

They were finally discovered at a small hotel near the St. Lazare Station, and two of the party then removed their bags to one of the official hotels, the name of which the A.C.C.F. should have wired to the A.C.U. This omission on the part of the French club was the only real hitch in the proceedings.

Was it worth it all? I say most emphatically, yes! We had the time of our lives. One cannot but admire the enterprise, enthusiasm, and really hard work displayed by the members of the A.C.C.F. Monsieurs Debailly, Buissard, Lecomte, Plazolles, Longuemare, and Dacier all worked with a will, and their work is purely honorary.

French Roads in Town and Country.

They chose a course over magnificent roads. French roads near towns and around the metropolis are notoriously bad, but so good was the surface in the open country and so charming the districts traversed that the uncomfortable part of the journey was soon forgotten. In fact, after a little practice, *pavé* riding soon became a habit. The only difficulty was for the Englishmen to realise that the *trottoir cyclable* was for use when encountered.

It was quite wonderful how the same officials turned up at the controls in different parts of the country, and how each was worked in an orderly and efficient manner. The absence of a rigidly observed speed limit and the resultant go-as-you-please method of running, quite unobtainable in this country, lent the trial a charm which can only be realised by those who took part in it, while the same may be said of the kindly attitude of the inhabitants, who showed themselves to be true sportsmen. Groups gathered at all the *caniveaux* in the villages, and cheered and clapped when an unfortunate rider got bumped out of his saddle, and egged him on to travel faster.

Everyone thought it was a race, and an old gentleman who saw me stop and take a photograph of a competitor coming through the picturesque gateway at Moret told me I would never win if I stopped to take pictures.

As regards my experiences as a competitor. I rode a 2¾ h.p. Douglas with two-speed gear and no free engine clutch, which, though it was the lightest machine in the English team, carried the most luggage. My bag contained spare suit, collars, shirts, pyjamas, etc., and weighed a considerable amount. The little machine rode over the awful *pavé* out of Paris in a perfectly splendid manner, but after the Fontainebleau control, where we began to strike really good roads for the first time, I experienced symptoms which made me suppose the jet was choked. Closing the air and racing the engine for a few seconds appeared to cure the obstruction, and I had no further trouble till after the speed trial at Montanglaust.

I am, however, progressing a little too fast. I was travelling well and longing for Coulommiers, when, seeing a pretty village on a hill across the intervening valley, and thinking what a pretty picture it would make, I heard a crash and saw Cook's machine in the road and Cook picking himself up, while just before Fletcher, Bishop, and I had helped Lake, whose two-speed gear was making an appalling noise.

We consulted with a peasant, and leaving Cook's machine with burst tyre and broken head by the roadside we bargained with a cab proprietor at Montpertuis to take the wreck to Coulommiers.

General view in the park at Versailles, where the trial ended.

A Competitor's View of the Circuit de Paris.—

At this place my machine was being filled up when the boy with the can spilt the petrol all over it. At the first sign of an engine explosion, as the machine was wheeled along, flames burst out. Bondini (the Italian rider of the 2½ h.p. Motosacoche), Pernette. Fletcher, and one or two others, rapidly came to the rescue and beat the flames out with their caps. Thanks to their prompt action the situation was saved and no damage resulted, but it was a near thing.

After the hill-climb and speed test my gallant little machine began to misfire and fall off in power, and an examination of the carburetter revealed a punctured float, due probably to the awful vibration set up by the *pavé*. Nothing else seemed amiss. The machine ran well in fits and starts, and by a little manipulation of the levers I got to Soissons ten minutes late.

The rest of the run was made to Compiègne in excellent form. There was, perhaps, a little grumbling at their being no hotel accommodation at Compiègne, but the pretty taxi drive through the forests the next morning was much appreciated.

The Second Day's Run.

The second day of the trial was very different from the first. The first day was like summer, and the second was bitterly cold, and the head wind very trying. After leaving Beauvais I decided to put things right. At the same time my gear lever wanted adjusting, so I saw to this myself and handed the mechanic in charge the float to repair. This intelligent person had when next I saw him soldered up the float with the petrol in it, so I told him to punch a tiny hole with a needle and boil the petrol out in a saucepan. As soon as I had finished the small adjustment I found he had punched a $\frac{1}{16}$in. hole with a nail, so I had to do the job myself eventually and pay a franc for the privilege. Even then the trouble was not over, so I at last took the whole carburetter down, and beyond finding a good deal of grit in the float chamber everything seemed all right.

However, all seemed to go well, and as I had lost much time there now followed a Junior T.T. of my own to Vernon. The little Douglas sped on at an incredible speed, with the wind whistling past my ears, for many a mile, and my spirits rose accordingly. I was gaining valuable time when the trouble happened again. Always after stopping the machine recovered, and eventually I found that the whole of the bad running was due to the vent hole in the filler cap being choked with dust. This vent hole is a groove in the threads on to which the cap screws, and when it is stopped up there is no outward indication of the fact.

Once the obstruction was cleared I made up time with a vengeance. Leaving Vernon last of all, I soon caught up my own class, and was not much behind my bigger brothers. At Maintenon there was a *controle* but no *controlleur*, so we waited about till it was time to re-start and then departed, and more Junior T.T.-ing followed to Versailles. With the wind behind we sped along in fine style, and made short work of the intervening distance.

At Versailles I had a look at La Française, a machine with an Anzani engine, slightly inclined forward, and *désaxé* cylinder, an overhead exhaust, and two automatic inlets in the cylinder head. It was quite a fast machine.

After the wait at Versailles for all the men to turn up, the competitors formed into a procession to ride into Paris. Tillman, as was mentioned last week, had received injuries through a fall caused by a dog, and could not start unassisted, so a Frenchman and I pushed him off. I arrived by one road at the Porte Maillot, while most of the others who followed another route had an unpleasant experience which I missed.

Accident to an Unfortunate Cyclist.

A cyclist, like many others of the scorching tribe, both French and English, was riding with his head down and never saw a tram approaching him. Griffiths and others yelled at him, but it was too late; he was struck on the head and a competitor rode over him.

Of course, we all entered Paris with a good deal less petrol than when we left, and so there would have been no duty to pay, but we were all too tired to *parlez-vous* with the Octroi officials, so one or two of us squeezed through beside a tram and sped up the Avenue de la Grande Armée, tore down the Champs Elysées, swooped round the half empty Place de la Concorde—inadvertently on the wrong side of the Column, causing a policeman to gesticulate madly and play tunes on his whistle, to which we did not stop to listen—and flying up the Rue Royale, we turned off by the Madeleine, and so reached our hotel.

It was a great ride. Dover and Kilpatrick eventually met at the Gare du Nord on Monday, having drifted in, one from Soissons and the other from Compiègne. They then went to Longchamps together, and there Kilpatrick was relieved of all his spare cash.

E.M.P.B.

SUGGESTED HILL-CLIMB IN THE ISLE OF MAN.

Permit Refused.

An application has been considered by the A.C.U. from the Mersey Motor Club for a permit to hold an open hill-climb in the Isle of Man on June 29th, the day after the Junior Tourist Trophy Race. After full consideration had been given to the matter, it was decided that the permit be not granted, as it was felt that it was undesirable for any other competitions to be held in the island at the same period as the T.T. races.

MARSEILLES TO NICE ROAD RACE. A control in the Esterel, amid magnificent scenery, between Frejus and Cannes.

Questions & Replies

A selection of questions of general interest received from readers and our replies thereto. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal queries should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Steel-studded Band.

The tyre of my 6 h.p. Zenith has worn very smooth. Can you recommend the Lomax steel studded band? Does it grip the road well and prevent punctures and skidding?—N.

The steel studded band mentioned is quite good. It grips the road well. The band will certainly not skid on a wet road and it will prevent punctures.

Brittle Gear Teeth.

I have just purchased a new two-speed chain drive motor cycle of well-known make. Upon the first trial recently a tooth in the gear box became broken and wedged. This I thought might have been my fault, although I have driven cars and owned motor cycles since 1904. I sent the gear box back to the makers, and they repaired and returned it free. Now, upon the second trial the same thing occurs, through no fault of mine that I can see. I had ridden the machine out about five miles on top gear, stopped in free engine position to light the lamp, but upon trying to start again could not do so, the gears being fixed, and upon being dismantled two or three teeth were found broken and wedged. Is it reasonable to ask the makers to exchange the machine for one of their free engine belt-driven, with epicyclic two-speed gear?—F.E.B.

Yes; under the circumstances, we should advise you to take the matter up again with the makers and ask them to meet you. Really the fault seems to be due to over-hardening of the teeth. Such a fault should never occur in the case of a well-made gear box. What you had better do is to put the case before the makers just as you have done to us.

3½ h.p. Two-speed and Sidecar.

Will you please give me your advice respecting the latest 3½ h.p. B.S.A. motor cycle with two-speed gear? Is this gear thoroughly reliable, equal to taking a sidecar up any reasonable hill? Is the wearing quality of this machine of the best? I want it for good all-round wear, not for racing.—A.W.H.

We have a high opinion of the machine mentioned, and feel sure it would suit your purpose. The gear should be reliable and would take a sidecar up most main road hills, only you must not expect a 3½ h.p. to do wonders on single figure gradients without a very low bottom gear ratio.

Manchester to Southampton.

I am contemplating a holiday run from Manchester to Southampton and back. Would you please advise what you consider a suitable route, avoiding traffic as far as possible? I had though of route as follows: Manchester Stockport, Crewe, Shrewsbury, Hereford, Gloucester, Swindon, and Southampton. Would you consider this a good route? What would be distance by the route you advise?—J.M.

We should recommend the following route: Manchester, Salford, Altrincham, Northwich, Middlewich, Nantwich, Market Drayton, Newport, along Watling Street, through Brownhills, through Castle Bromwich, Stonebridge, Kenilworth, Warwick, Banbury, Oxford, Abingdon, East Ilsley, Newbury, Whitchurch, Winchester, Eastleigh, Southampton. This is a better route, avoiding more towns and traffic, than that suggested in your letter. The distance is approximately 240 miles.

Two-stroke Machine.

Has the Scott two-stroke as much flexibility and power of speedy acceleration as a four-cylinder F.N.? What might I expect to get a 1910 Scott for (in good order) from a firm like Godfrey and Applebee?—S.C.M.

The machine in question is fairly flexible, has plenty of power, accelerates excellently, and is a really magnificent machine. If you are investing in one we should recommend the 1911 model which is a great improvement upon the 1910. The 1910 model could be purchased for a fairly reasonable price. We should strongly advise you to purchase one at about £35 of a later type.

A Lightweight for Convenience.

I should be glad to have your opinion of the 1911 2½ h.p. Motosacoche and 1911 2 h.p. Humber. Is there much actual difference in the speed and reliability of these machines? I want a motor for short distances, though occasionally for 70 mile runs, but owing to a long passage, yard, and big stone step, and to this being the centre of the town, I cannot use a heavyweight. At the same time, as I am twelve stones, I must not have anything under-powered.—E.F.P.

We should say there would be very little to choose between the two machines mentioned in your letter, though the 2½ h.p. is naturally the more powerful. Both are good and up to your weight. Either would suit you for short distances. Of course, you must not expect exceptional speeds from either of these machines, but as you live in a comparatively flat country the power will suffice.

SCENES AT PENZANCE, THE HALF-WAY POINT OF THE LONDON-LAND'S END AND BACK RUN.

The timekeeper, Mr. F. T. Bidlake, starting J. Chater Lea. Competitors lining up for the start of the homeward journey. J. Stevens (5 h.p. A.J.S. sidecar).

HUTCHINSON TYRES

M.C.C. LAND'S END RELIABILITY TRIAL.

15 MEDALS

OBTAINED BY RIDERS OF

THESE FAMOUS TYRES.

ALSO THE

SPECIAL AWARD

FOR

BEST LIGHTWEIGHT PERFORMANCE,

Won by Mr. P. W. Moffatt.

THUS HUTCHINSON TYRES

Secure over 33⅓% of the Total Medals Awarded.

IMPORTANT. The Hutchinson Tyres used in all competitions on track and road are identical in every respect to those supplied to the public.

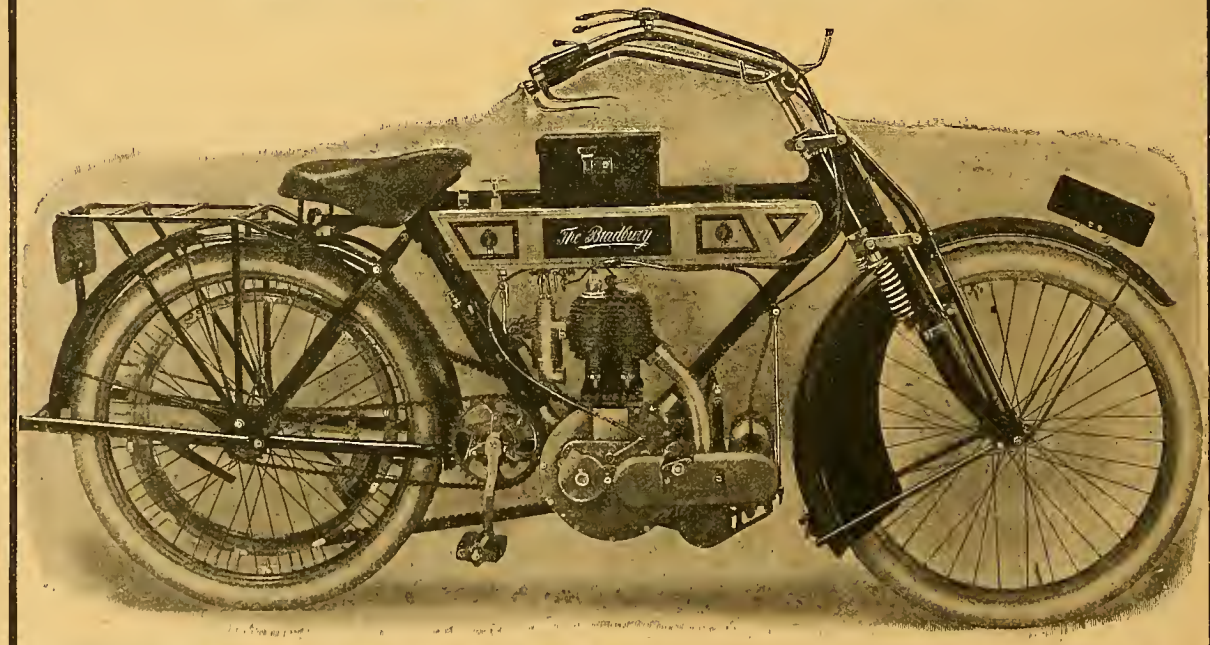
HUTCHINSON TYRE CO.,

70, Basinghall Street, E.C.

COUPON. This Coupon entitles you to our Novelty Booklet "W H Y," and latest Catalog.



The Bradbury

again proves its Reliability.

London to Land's End and Back. FIVE BRADBURY Riders successful.

(Messrs. W. Cooper, C. W. Meredith, A. R. Abbott, R. C. Owen Wells —on a Chain-driven Machine—and Hugh Gibson, who finished to time, winning Four Gold and One Silver Medals.)

The only Single cylinder Machine with Sidecar that came successfully through the trial was the **3½ h.p. Two-speed Gear Bradbury**, ridden by Mr. Hugh Gibson. *Motor Cycling* says of this performance that "it was one of the finest in the trial, and how he got through on time is a marvel, considering the severity of the course."

The above trial was a real and severe test of a machine's reliability, and the success of the Bradbury Motor Cycles is convincing proof of their excellent qualities.

HARROGATE M.C.C. HILL CLIMB. Class 3. First and fastest time: Mr. W. E. GRANGE.

Send for catalogue and address of nearest agent to—

BRADBURY & Co. Ltd., OLDHAM

London to Holyhead.

Please tell me the best route from London to Holyhead and the distance.—F.C.K.

Your best route would be as follows: London, Regent's Park, Barnet, St. Albans, Dunstable, Fenny Stratford, Stony Stratford, Weedon, and Daventry. At the end of the town there is a signpost to Holyhead, put up by the Royal Automobile Club. All you have to do for the rest of the journey is to follow these signposts. The distance is approximately 260 miles.

Exeter to Finsbury Park, N.

In a week or two I am driving my 1907 single gear twin Rex and sidecar from Plymouth to London and should like to know the best way from Exeter onwards, and the best way to get to Finsbury Park, N. I have done very little town driving, and none in London.—J.F.

Your best route would be as follows: Exeter, Honiton, Chard, Crewkerne, Yeovil, Shaftesbury, Salisbury, Andover, Whitchurch, Basingstoke, Bagshot, Staines, Hounslow; at the junction of the Bath Road turn left and go through Hanwell, Greenford, where turn left and then right for Harrow. Near Harrow Station turn right and go straight through till you reach the Edgware Road, cross over here, go through Hendon and along Golders Green to Hampstead Heath. Here ask your way to Highgate, a road from which will bring you to Upper Holloway, which is close to Finsbury Park. Anyone there will tell you where you want to go. The route avoids most of the bad traffic. The distance would be approximately 178 miles.

Touring Abroad.

(1.) Will you kindly oblige me with the route (good scenery) from Ostend, Belgium, to Neuchatel, Switzerland, returning through France to Paris Rouen, and Dieppe? (2.) What is the condition of the roads? (3.) Is petrol easily obtained and at what price? (4.) What are the speed limits?—T.B.

What we should recommend you to do is to become a touring member of the A.C.U. (89, Pall Mall, S.W.), where they have all the machinery for working out tours and giving information. (1.) In the first place, we should advise you not to entertain Ostend or Belgium if you are going to Nenchatel. Except in the Ardennes, the roads in Belgium are very bad. Evidently the best way would be to go by the following route: Dieppe, Neuchatel, Beauvais, Compiègne, Soissons, Reims, Châlons-sur-Marne, Vitry, le Francois, Neuchateau, Bains, Luxeuil, Montbeliard, St. Hippolyte, Gounois, La Chaux de Fonds, Neuchatel. (2.) We know this road as far as Bains and, for the most part, the surface is good The scenery is pretty, especially in the Vosges, and it would be infinitely preferable to going through Belgium, where the roads are execrable. (3.) Petrol is obtainable practically everywhere at about 1s. 8d. or 2s. per gallon. The average price is about forty-two centimes per litre. (4.) The speed limit is nominally nineteen miles an hour; actually there is no limit at all

Two-stroke for India.

(1.) Is a two-stroke engine to be recommended for a novice on the ground of simplicity? (2.) Would a hot climate be likely to put any difficulties in the way of running a two-stroke engine? (3.) What is the lowest h.p. possible for a cycle (with two-speed gear and single-cylinder) and a sidecar with a light passenger (eight stones) and in a fairly flat country? (4.) Is a shaft-drive likely to be superior in every way to a belt-drive in a hot, damp climate (Bengal)?—R.J.H.

(1.) There is not much to go wrong in a two-stroke engine, (2) but if you are going to use it in a hot climate a water-cooled engine would be advisable. (3.) The lowest h.p. for sidecar work is 3½. (4.) We do not know of a two-stroke machine with shaft-drive; chain-drive is fitted.

READERS' REPLIES.

St. Leonards-on-Sea to Leicester.

I notice in your issue of April 4th a query by "F.P." for best and shortest route from St. Leonards-on-Sea to Leicester. As I recently did this journey both ways, perhaps I might be permitted, with all due diffidence, to offer an alternative, and, I think, superior, route to the one you give. I went as follows: St. Leonards, Robertsbridge, Tonbridge, Sevenoaks, Westerham, Godstone, Caterham Valley, Upper Caterham, Coulsdon, Woodmansterne, Banstead, Ewell, Surbiton, Kingston, Hampton, follow tramlines and turn off to the left at Uxbridge Road, through Feltham to Uxbridge, Amersham, Aylesbury, Buckingham, Towcester, Daventry, Lutterworth, to Leicester. About 175 miles. I did this very comfortably on my 1910 two-speed Humber in eight hours last month, including two stops for petrol and three-quarters of an hour for lunch. The traffic and tramlines are no worse than one encounters going through Reading. The distance is by Cowey speedometer.—HAROLD F. A. KINDER.

Magneto Rocking Arm Sticking.

Several of your readers complain of the magneto rocking arm sticking. To get a straight hole through the fibre bush, the following, I have found, answers well Procure a round piece of metal a comfortable fit in the bush, put a fine saw or file cut in the top and then ream through with thumb and fingers.—R. H. ADAMS.

EXPERIENCES WANTED.

Readers desirous of obtaining the experiences of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries below should be addressed c/o The Editor.

"H.C." (Plumstead).—3½ h.p. Rex single speed, with and without sidecar.

"H.F.P." (Guildford).—2¾ h.p. Levis two stroke, and 2 h.p. Humber for business purposes.

"Pedro" (New Malden).—3½ h.p. Lincoln Elk, with and without two or three speed gear.

"F.C.B."—Bowden and other countershaft gears.

"P.W.D." (Richmond).—3½ h.p. Rudge Multi with sidecar.

"A.K." (Aylsham).—3½ h.p. 1912 Bradbury chain drive.

"W.L." (Kensington).—The Binks two-jet and Lukin carburetters, slow running and control in traffic.

"P.C.B." (Selsey).—A.C. Sociable, average petrol consumption.

"C.C." (Folkestone).—T.M.C. and sidecar, reliability and petrol consumption.

"J.H." (Durham).—T.M.C. 1912 with sidecar, power, transmission, gears, and starting with clutch.

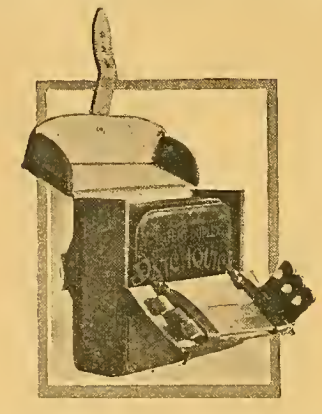
"J.B." (Cathcart).—2¾ M.R., Armstrong three-speed gear.

"J.B." (Glasgow).—F.N. four-cylinder two-speed gear for sidecar work, hill-climbing, petrol consumption, and cool running.

M.C.C. TRIAL FROM LONDON TO LAND'S END AND BACK.
Some of the early arrivals at the "End." The riders are R. Lord (6 h.p. Rex sidette), S. J Bellchambers (3½ h.p. Rover), G. T. Gray (3½ h.p. Rudge), and B. Alan Hill (7 h.p. Indian sidecar).

Six Days' Sidecar Ride.

Arnold Butler, who recently accomplished a successful six days' sidecar ride, used a Stanley belt on his A.S.L. machine. He assures us that the belt went through without trouble, and was only shortened once.



Trade Announcements.

We are asked to point out that Mr. Fritz Sabel, director of Sabella Cars, Ltd., is the original designer of the Sabella cyclecar.

Mr. Stacey, a well-known member of the Sheffield and Hallamshire M.C.C., has joined Mr. J. Barker, of Dronfield. The firm will be known in future as Barker and Stacey.

A Neat Tyre Repair Outfit.

The accompanying illustration shows how extremely neatly the leather wallet supplied by Messrs. Woodgates Bros., Tiverton, Devon, encloses their well-known Patchquick repair outfit and the

set of three tyre levers. This wallet is designed to fasten on the carrier of the machine, and is one of the most useful and novel accessories which have been brought to our notice of late.

Vulcanising.

Harvey Frost and Co., 27, Charing Cross Road, W.C., are just about to place on the market a small portable H.F. vulcaniser especially made for motor cycle tyres. It will be in a very compact form, and will repair covers and tubes either on or off the wheels. It will be sold at a very low figure.

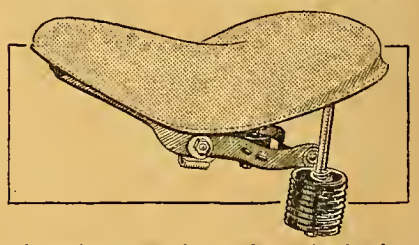
Catalogue Received.

The eighth edition of the catalogue of Juno motor cycles and accessories is to hand. This is a very complete list, embracing as it does descriptions and illustrations of the Juno machines, various makes of tyres, speed indicators, and other accessories. The list, which is issued by the Metropolitan Machinists' Co., Ltd., 248, Bishopsgate, E.C., also contains particulars and prices for building wheels fitted with most of the free engine and variable gears on the market.

A Good Belt.

A few weeks ago, Brown Bros., Ltd., Newman Street, Oxford Street, W., sent us a 1in. rubber and canvas belt for trial. This we fitted to one of our sidecar machines, and after running it about 300 miles we find it is quite satisfactory. In the initial stages it required shortening a few times, but as it was used in the very worst of weather this is not surprising. The extra strain of hauling a sidecar always shows up the merits of any belt, and, considering that the Brown belt has done 300 miles in extremely bad weather, and looks little the worse for its experience, it must be classed among the best of this type of power transmitter.

Burglars Again.



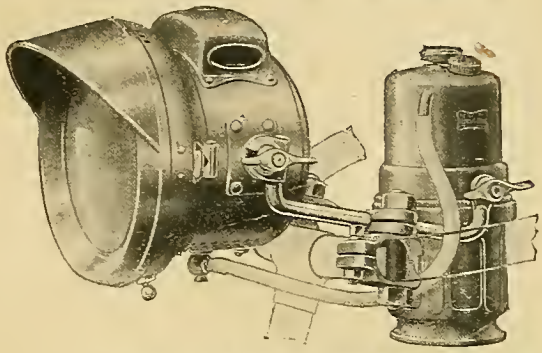
G. T. Riches and Co., 19, Store Street, W.C., inform us that their premises were entered by burglars during the Easter holidays. Among other things the letter box was rifled, so that if any of our readers do not receive replies to any communications they have made to Messrs. Riches they are requested to be good enough to repeat them.

Sidecar Lighting.

It is advisable, nay essential, for sidecarists to carry lamps placed in such a position that they show the full width of the vehicle. Recognising this, H. Miller and Co., Miller Street, Birmingham, have introduced a reasonably priced acetylene lamp complete with a bracket specially designed for attachment to a sidecar. The lamp shows a white light in front and a red rear light, and is hung on springs. It is made to suit either the left or right side, and is priced at a very moderate figure.

Brooks's Anatomical Saddle.

The distinguishing characteristic of the B 170 Brooks saddle is the seat part, which consists of a carefully moulded steel base amply and very comfortably cushioned,



and having over all a substantial leather covering. Being shaped on anatomical lines, this seat enables the rider to sit in it rather than on it, and its consequent comfort is particularly noticeable on long journeys. The springing is practically identical with the same makers' compound springs, which eliminate vibration, and dispense with objectionable rebound.

Members of the Brookdale Club (motor section) photographed outside the headquarters, Brookdale Hall, Catford, on the occasion of the opening run to Brighton.

ONE REASON
FOR THE GREAT SUPERIORITY OF
LUCAS
"KING OF THE ROAD"
LAMPS

OVER ALL OTHERS IS THAT THEY ARE DESIGNED AND MADE BY MEN WHO KNOW THEIR BUSINESS THOROUGHLY—NOT BY THOSE WHO MERELY MUDDLE THROUGH AND THINK THEY KNOW. *SKILL COUNTS.*

The Lucas "King of the Road" Projector Set No. 462.

Fitted with Mangin Lens Mirror and Instantaneous Carbide-Container Fixing.

NEW PATTERN FOR 1912.

Lyndale,
Woodend Lane, Erdington,
Birmingham.
April 4th, 1912.

Messrs. Joseph Lucas, Ltd.
Dear Sirs,

Will you kindly send catalogue of your latest Lamps, etc. I have used your lamps on Matchless and Sidecar this last year, and am pleased to say they *have never given any trouble.* As for light giving I consider them *far superior* to any other make. I have tried several of the highly priced and advertised lights, but have been very pleased to see the last of them.

Yours truly,
(Signed) T. BRIDGWATER.

Send for descriptive Catalog of Lucas Motor-Cyclealities, post free from Dept. F.

JOSEPH LUCAS LTD., BIRMINGHAM.

WE MAKE LIGHT OF OUR LABOUR.

Everything for the Motor Cyclist, and everything for the Motor Cycle.

Dunhill's
ALL WEATHER SUIT.

There is nothing more gratifying than the sense of independence aroused by clothing which can be relied on to protect you against all conditions of weather. A suit that will, on a wet day, take you dry through the heaviest shower, or, on a dry, dusty day, effectually exclude all dust. Such a suit is one made of our popular Dunwear Cloth, which, though combining the qualities of both Showerproof and Dustproof garments, unlike Paramatta or Holland, it can be properly tailored, and has the distinctive feature, which neither of these can claim, of a remarkably smart appearance. Being rubberless, the perfect ventilation essential to comfort on a hot day is ensured. This suit is especially ideal at present, the weather at this time of the year being more varied than at any other period, and to fully enjoy his rides the motor cyclist must have one.

FREE GIFTS TO ALL.

We are wishful for a list of all the Motor Cycle Agents and Dealers in England. In order to get this, we are prepared to make you a present, according to the number of names and addresses that you can send us. These presents will vary from Harrison's Back-rests to Exhaust Whistles and Handle-bar Mirrors. Everybody will get something, as long as you send us the names and addresses of a dozen Motor Cycle Dealers. We don't want those that advertise in the papers, as we know all those. We want particulars of the little man in a small way, and of the big man if he does not advertise. If you send the name and address of every one of these in your town, you will be entitled to something in the way of an Exhaust Whistle, or Mirror, if you can make the list up to a dozen. Besides the present, you will get one of our Sale Lists.

We are declining the Accessories Trade, as you are perhaps aware, and we have an enormous amount of goods that we want to clear out cheap. They comprise such things as the following, for instance:

Just over 200 pairs of Morecambe Ribbed and Studded Covers, which you can have at 16/11½, 19/11½, and 23/11½. We have also 1,000 Tubes, 4/11½ and 8/11½; butt ended, 11/11½. All are good class stuff, and new. Besides the covers and tubes, we have a stock of Belts, and, as long as they last, we are clearing them out at 4d. per foot off list price. We have also dozens of Lamps, all makes, including Lucas and F.R.S.; XL'All Saddles, Seat-pillars, and Spring Forks; F.R.S. and Harrison's Back-rests; Exhaust Whistles; Mirrors; Speedometers; New and Second-hand Saddles, all makes; ditto Bags; Mabon Clutches, about two dozen, to fit various machines; one or two N.S.U. two speeds; also Albion two-speed and f.e.; Paraffin Tricar Lamps and Car Lamps; odd lines of Clothing, from 11/11½ per suit; Waterproof Leather Jackets, 19/6; Garner Whistles; odd Engines, Frames, and Wheels; Trembler and Non-trembler Coils; Accumulators and Dry Cells; Druid, Bradbury, and Air Spriogs, Ltd., Spring Forks; and many other odds and ends for the bhoys building up Motor Cycles; 100 1911 B. & B. Carburetters, 22/6 each to clear them out; 1912 ditto, 26/- each; about a dozen Accumulator Motor Cycles: these you can have at £4 19s. 6d. each, cash down; good machines, but not guaranteed to do Honiston Pass; send along £5, and we will pick you out a machine. If you want one a little better, send £1 more. If you can sport £10, send it along, and we will send you a magneto machine.

For cash down you can take 20% off any second-hand machines in our list. If you have not had one, you should have one. We must have many hundreds of pounds' worth of tackle about the place people are wanting every day in the week. Let us know what you want before buying elsewhere. We keep a staff of clerks handy to answer letters, and we are always pleased to reply to all our clients' enquiries. We can do a great many things for you, barring supplying such things as a 1912 F.E. Triumph for about £12, and an accumulator machine or a 5-6 h.p. Clyno and Sidecar for £25. We very often get letters from our friends wanting such luxuries, and we have to keep telling them that we have nothing to give away. We gave all we have to give away last week. We get a matter of a dozen of these Sunny Jims writing every morning, and we can only imagine that they write either from ignorance or under the impression that we are running a philanthropic institution, or perhaps to hear what that kid Hitchen will say for himself when he gets his hair off.

We are also wishful to shift the enormous stock of Second-hand Motor Cycles that have been gathered together in the garage during the past few months, and which have been taken in exchange deals for new machines, and we have over 150 here. Owing to the huge stock of new ones that we have coming in during the season, we shall have to shift them or will have to take another garage, as there won't be room for all the stuff. Write and tell us what you want: make us an offer. We have made up our minds to shift this second-hand tackle, coal war or no coal war, and whether the railway or other strikes come off or not.

We still believe we have here the largest stock in the world, and if you have not been to see us you should have been. It will be an eye-opener for you. We don't waste valuable time in putting all this stuff in a list in the papers, as it would cost £50 per week to do so. By not spending this amount we are able to sell you things cheaply.

Another reason why we are able to sell things so cheaply is that we do not pay huge sums in rent. The rent of our establishment does not cost as much per annum as some firms pay per week. The place is a shabby old place. It is nothing to look at, but it is large, and the STOCK IS THERE; and that is what you want to see—not an elaborate building of handsome proportions.

Amongst the stock at the moment there are: P and M.'s, Jap-Bats, Matchless, Clynos, Bradburys, Zeniths, Humbers, Premiers, Motosacoches, Lincoln-Elks, A.C.'s, Rudges, New Hudsons, Triumphs, etc.; and we expect Douglas and Morgans any time. We have all models: Single and two-speeds, twins, and all the rest of it. The trade will find us on the jump for their orders. Don't waste time. Wire or 'phone your orders. Best trade terms and early delivery guaranteed.

Note.—The above list of machines is correct. We get the machines delivered before others, as we pay promptly, take all dis., and the makers can rely on Hitchen's being ready with the rhino when they are ready with the machine. At the moment of writing we hold five P. & M.'s, four Scotts, and other equally rare luxuries for your purchase. Don't believe the tale that they cannot be got—it's all cod. We have 'em here for you.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 14 words or less 1/6, and 1d. per word after. Each paragraph is charged separately. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor Street, E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should state distinctly under what heading and in what issue the announcement appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

CLASSIFICATION BY LOCALITY.

For the convenience of purchasers of second-hand motor cycles, the advertisements are classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Plan showing division of England into Sections.

SECTION I.
Northumberland, Cumberland, Durham, and Westmoreland.

SECTION II.
York and Lancashire.

SECTION III.

Wires: Opificer, London. 'Phone: Holborn 5777.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

☞DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR BICYCLES FOR SALE.

Motor Cycle Taxation.

TO-DAY the Treasury Committee on Horse-power Rating will hear the evidence of the Auto Cycle Union delegate on this important subject. This committee specially asked the A.C.U. to give evidence, and Mr. Archibald Sharp, whose technical knowledge renders him eligible for the work, has been chosen to attend the meeting. It is as well to point out that to many motor cyclists, especially the large number who ride cheaply purchased second-hand machines, the present taxes are inordinately high. £1 for the local taxation licence plus the 5s. driving licence and 5s. registration fee—£1 10s. in all and plus 3d. for every gallon of petrol he uses, make a big hole in the income of the man who has bought a second-hand machine for £10.

In proportion to the income of the average motor cyclist, and considering that the motor bicycle does but little more damage to the road than the pedal cycle, the tax is already a great deal too high. What seems to us a reasonably fair suggestion would be to leave the present tax as it is for all sizes of machines, and to allow the owners of machines of over two years old to pay half the present amount, over four years' old one quarter. There is also talk, we understand, of taxing two-stroke machines more heavily than those fitted with four-cycle engines. If this be so it is most unfair. The two-stroke engine, it is true, should develop theoretically double the power of the four-stroke engine, but we know very well in practice it does not. It is, moreover, young as regards the motor cycle industry, or at any rate its growth has not been rapid, and its development has been slow. Now it is beginning to revive, and promises to take a prominent part in the industry of the future. Weight for weight motor cycles are taxed far more highly than motor cars. 5s. per cwt. would be ample.

Unofficial Records Doomed.

FOLLOWING our leaderette of last week, we are pleased to see that the Auto Cycle Union has decided to take action with regard to all record performances which are not held under the competition rules of the Union. These record attempts were rapidly assuming a farcical position, and it was quite time that steps were taken to prevent too great prominence being given to accomplishments which would, if persisted in, have drawn ridicule on the pastime. If the General Committee of the A.C.U. endorse the views of the Competitions Committee, and we see no reason why they should not, the day of the unofficial record is doomed. As we have previously mentioned, there are many methods of securing publicity in connection with properly authenticated performances, as the A.C.U. is quite willing to check the reliability and power of any machine that is submitted to it, and to issue certificates showing exactly what the machine is capable of. Brooklands, the finest track probably in the world, exists for pure speed records. Speeds greatly in excess of the legal limit on public roads are not desirable, and as a proof of human stamina the long distance rides entailing day and night riding are in danger of being overdone. Ample proof is in existence that the motor cycle is as reliable as human skill can make it, and if anyone wants further to improve its capability for continuous travel let him devise an unpuncturable pneumatic tyre.

IN season—perhaps likewise out of season—I have in these pages besought my brethren of the motor cycle to stick together and to work together towards our common welfare, and now once more I make one last appeal to every single one of my readers to make one last little effort, assuring them, if they will but do this, there will be no cause for future worry—the victory will be won and the great sport of motor cycling will come into its own in one victorious jump, proving to the world at large—and to the military authorities in particular—that the motor cyclists are a great and united body, and constitute a force of public opinion and of military power that can no longer be disregarded.

The Military Aspect.

My opinion is that within one month of the mobilisation test referred to in *The Motor Cycle* on April 4th, an order will emanate from Whitehall allowing every Territorial Cyclist Battalion to enlist twenty motor cyclists, who will receive an allowance for petrol and wear and tear of machine; and within three months a still further order will issue from the same source, calling upon two thousand civilian motor cyclists to enrol their names as willing to serve their country in the event of a great crisis, and willing to come out at Army Manœuvres for special staff work, when ample financial allowances will be payable.

The Civilian Aspect.

But many of you will put forward the plea that you do not care a jot for matters military, but is that a reason why in this supreme moment you should withhold your support from your more patriotic brethren? "Just one more effort, Sooky," as dear old Dan Leno used to say in the pantomime. In one word I appeal to the civilian-minded motor cyclist to lend his brother a helping hand—help him to attain his heart's desire and the official recognition and status that he undoubtedly deserves, and most undoubtedly will attain if you will but help him on this one day—this day of supreme importance in the history of motor cycling. Apart from all question of appealing to your good-nature, surely this is a truly sporting and enjoyable test into which you are invited to enter—a test of which you yourself will feel proud. If you take part therein you will meet hundreds of motor cyclists from every part of the kingdom. Already competitors have sent in their names from every city, town, and county from the Solway Firth to the English Channel; from the German Ocean to the Irish Sea.

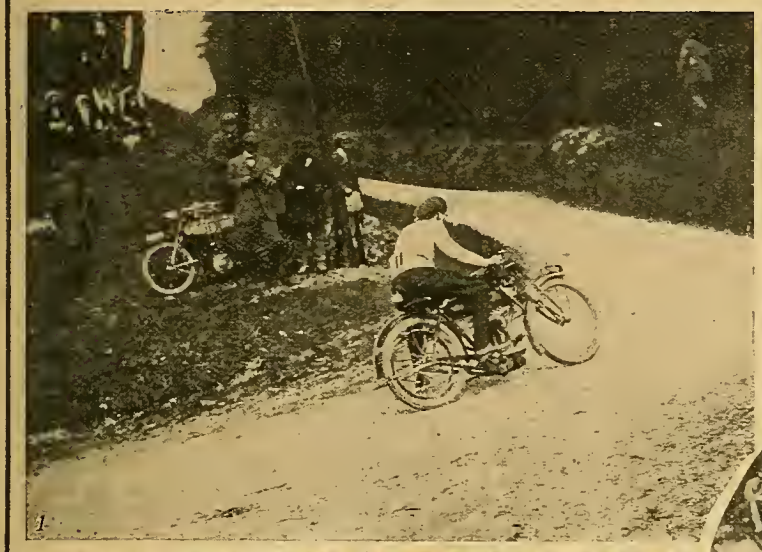
The Scheme Explained.

Every motor cyclist in England, Scotland, and Wales is invited to take part. Those who send in their names will receive by post the magic word to "mobilise" at the secret rendezvous. These summonses will be despatched in such a way as to enable every competitor to reach the selected spot on the Saturday afternoon. Here they will be inspected by General Thorneycroft, C.B., and a staff of officers, who will make notes on the condition of the machines, the distance travelled, and the times accomplished. Here also accommodation of every kind will be provided for those who desire it, to suit every condition of purse and pocket. Subsequently a list will be published and circulated giving the names, etc., of the hundred riders who are considered to have accomplished the most meritorious performance. Merit will not depend on any one factor of speed, distance, endurance, etc., but all of these will be taken into consideration.

How to Take Part in the Mobilisation.

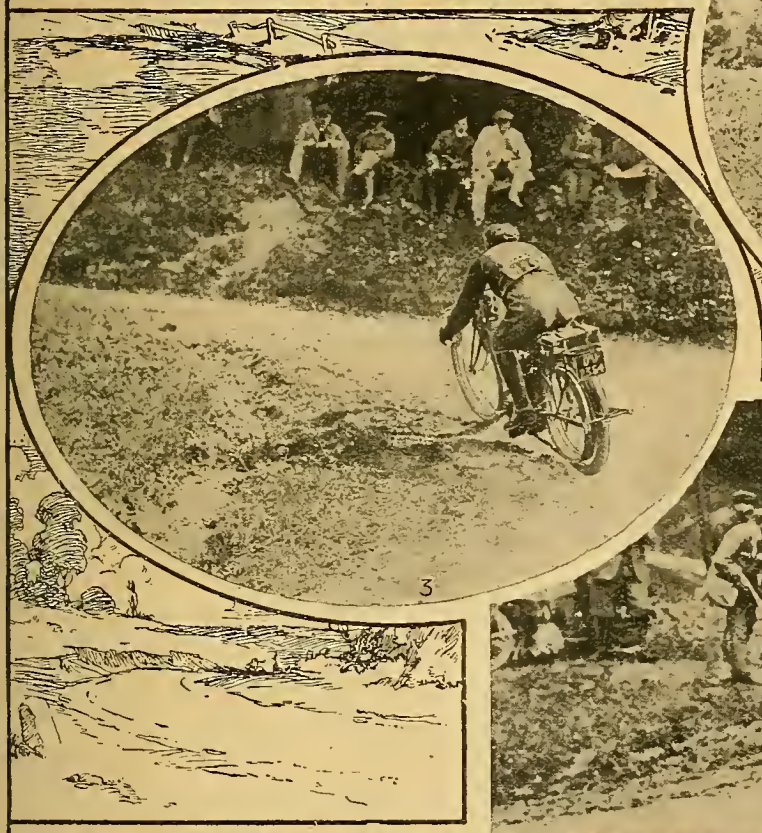
In the first place follow the directions given on page 366 in *The Motor Cycle* of April 4th. You will then receive the order to mobilise on your own postcard, and this you will carefully hand in on arrival at the rendezvous to the officer on duty.

Although this mobilisation is being carried out under the auspices of the Legion of Cyclists, they are throwing the entry for the test open to everybody—which is rather sporting of them, but perhaps part of a wide-seeing policy, for undoubtedly the vast majority of those who compete will take that opportunity to join the Legion. In the past few weeks this new force in the world of wheels has sprung into a prominent place, and now has some hundred and twenty branches throughout the United Kingdom

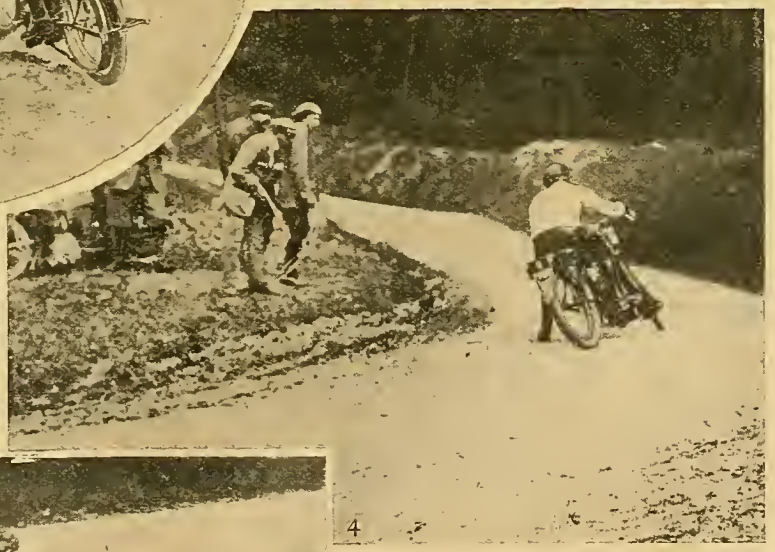


The object of the Legion is to organise in peace time those motor cyclists and cyclists who in case of an invasion would be willing to assist in the defence of their country. Not only are its members organised, but they are also given as many opportunities as they can desire to acquire military knowledge, so that when their services are needed they will be of some avail. Those desirous of joining should apply to the officer in their own locality or to the hon. secretary of the Legion, Captain A. H. Trapmann, 117, Piccadilly, W., enclosing a stamped and addressed envelope. Membership of the Legion entails no expense, and there is no subscription, but members must provide themselves with a badge of Legion (1s. 4d.), and later with the corps badge of their own locality (9d.)

The Future of the Legion.



The Legion hopes in the course of the next few months to number at least ten thousand members, grouped into organised corps, each under its own officers and in close touch with the military authorities. It will then be in a position to supply not only the whole of the 2,000 motor cyclists which I have referred to above, but also corps of local cyclist guides, telegraphists, and other specialists for the Technical Reserve when at last that scheme is given to the public.



From time to time during the year great national rallies and gatherings will be organised by the Legion. In the meanwhile all motor cyclists are invited to join this great national movement. But those who wish to take part in the Mobilisation should apply at once.

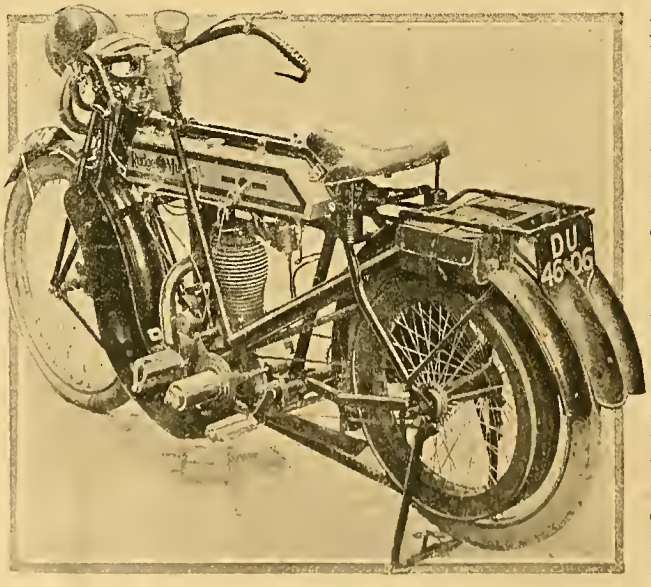
IN PRAISE OF THE VARIABLE GEAR.



A TRIAL OF THE RUDGE MULTI.

THE more one studies the change speed gear question the more one is forced to the conclusion that an infinitely variable gear, that is between high and low limits, is the ideal in theory whatever its shortcomings may be in practice. Variable gears by means of expanding and contracting engine pulleys have been evolved by the dozen, but usually their designers have relied upon the movement of a single engine pulley flange only, which obviously has the effect of throwing the belt out of line when the ratios are varied, and this leads to undue wear of the belt. It was discussing the shortcomings of gears in this way that led Mr. Victor A. Holroyd, works manager of Rudge-Whitworth, Ltd., to invite us to use on an extended run a Rudge Multi, the variable gear of which has now undergone many thousands of miles of road testing in all weathers, and has further been rendered neater, lighter, and more compact than it appeared at the last Olympia Show. Mr. Holroyd proffered his own machine for our trial, and on the day arranged it was delivered to our offices, when we took an early opportunity of becoming acquainted with its management.

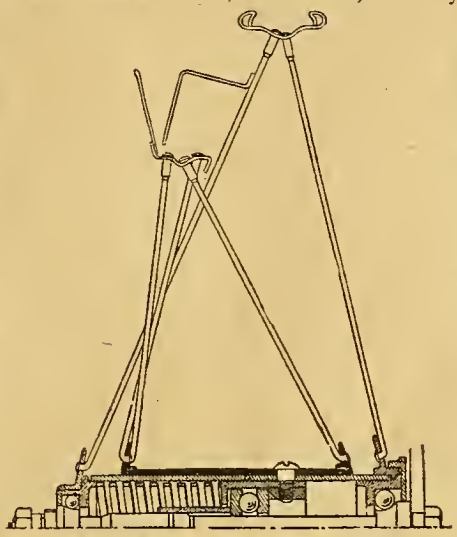
First Impressions.

First of all we should like to record our sincere thanks for its complete equipment. Unfortunately, we poor journalists are too often saddled with a new machine for trial devoid of toolbag, nay, even a tyre pump, and yet are expected to travel far and wide. To anyone personally acquainted with the owner of our trial mount, it will suffice to say that the machine was fitted out in true Holroyd style; to others we would say it lacked nothing a motor cycle should have on a 1,000 miles tour, and had a good many fittings one could well do without.

Now to the running of the machine. Starting the engine by the pedals and disengaging the clutch, one pushes the machine off the stand with the toes, and with the gear lever anywhere behind the central position of the quadrant, the clutch is engaged, and away the machine will go, picking up speed with astonishing celerity, thanks to the comparatively low gear ratio. The next operation is to suit the gear to the rider's desire, and there is a range of no less than twenty ratios all within the rider's reach. Think of it, ye speed lovers! a racing gear of 3½ to 1 for favourable stretches, and a 9 to 1 ratio for hills, and all this possible without a dismount and with very little added complication; in fact, nothing worse than a few pounds extra weight.

The 3½ h.p. Rudge Multi with which our test was made. The special mudguarding of this machine cannot fail to attract attention.

A Dream Fulfilled.



But what of the belt, asks the wary individual who has perhaps heard of rapid belt wear on variable pulley gears. We ourselves took particular notice of this question, and on our initial run from Coventry to Harrogate shortened the belt once *en route*, and again at Harrogate, but that was the last time, for the run home was accomplished non-stop, and several other shorter runs, making a total of about 260 miles without need for shortening the Dunlop belt, and we observed with satisfaction that the fastener ends of the belt were practically undamaged. Now this is an undoubted step forward.

What motor cyclist has not dreamed of a machine which will do twenty miles per hour on the level with the engine slowly ticking round, that is safe to crawl through traffic, and up single figure gradients on narrow twisty by-lanes, and yet have the capacity for tearing up hills on occasion when the conditions are favourable? Such a machine is among us; it is the Rudge Multi, and the man in the street is acquainted with the fact as the machine flashes past him, no! not solely on account of its healthy bark so much as the lettering on the tank. In connection with the noise of the exhaust we made rather an interesting experiment, to us at any rate. It is well-known that the Rudge has a liberal-sized cut-out, but as it also is of the variable pattern, it is possible

In Praise of the Variable Gear.—

to get any degree of noise from fairly silent to very noisy. Finding that the engine kept as cool as ever with the cut-out only half-open, we left it in that position, and no one could say that the machine was unduly noisy. Rudge owners read, mark, and inwardly digest.

Those readers who have experienced the delights of bowling along a favourable stretch of road on a high gear will appreciate the Rudge multiple speed gear; those who are used to touring day in and day out with a fixed gear of about 5 to 1 have pleasures in store. The sensation of hurtling through the air on a gear of 3½ to 1, the engine calmly turning over, is a real delight, and there is no lurking suspicion that "I believe I shall have to get off and lower the gear for —." A tug at the conveniently placed lever and the rider may drop to any of the nineteen ratios available; he does, in fact, suit the gear to the gradient. Some gears of the type under review are not efficient on the lower ratios, but as we have climbed Leathley Bank, Edge Hill, and Sunrising on the Rudge Multi with plenty in hand, such a suggestion in regard to this machine may be discounted.

Section of the rear hub of the Rudge Multi, showing the sliding sleeve.

Constructional Details.

Reverting to the question of belt wear, the reason the Rudge is not hard on belts is no secret at all. The operating lever expands the engine pulley by means of cams, and by the same movement contracts the rear pulley in unison. Thus the pulleys are always in line, and the belt is always at the same tension or approximately so. We reproduce a section of the rear hub and belt rim showing their construction. The rear wheel is built up with a special hub over which slides a sleeve. The fixed portion of the belt rim is attached to the wheel spokes, ut the loose flange is spoked to the sleeve. Five studs in the sleeve pass through slots in the wheel hub and into a bush, so that the drive on the loose flange is partly taken by the spokes of the wheel hub and partly by the studs. The bush is connected to a rod passing up the centre of the hollow axle, the control of the rod being governed by the movement of the cam disc of the engine pulley, so that a forward movement of the hand lever moves both the inner flange of the engine pulley and the outer flange of the rear pulley outwards. For "go-anywhere" work and occasional use with a sidecar the Rudge is eminently suitable.

ENGLISH-DUTCH RELIABILITY TRIAL.

The Complete List of British Entrants.

THE list of British entrants for the above contest as printed below has now been circulated among the secretaries of the leading motor cycle clubs throughout the country with a request that the matter be brought to the notice of their respective committees. We are asking the co-operation of clubs in choosing the British team, as we are desirous of obtaining an absolutely impartial selection. There will be three competitors in each class, and the votes will also determine the reserve men.

Club committees are asked to bear in mind the request of the organising body, the Dutch Motor Cycle Club, to vary the makes of motor cycles represented as far as possible.

It is expected that the replies from the clubs will be to hand by the middle of May, and the actual teams can be made known by the end of that month.

Dutch motor cyclists are taking up the trial enthusiastically, especially private owners. In this section there are fifteen entries.

Private Owners.

Class A. Machines up to 350 c.c.	Class B. Machines from 340 c.c. to 500 c.c.	Class C. Machines from 500 to 1,000 c.c.
Geoffrey Smith (2¾ Humber)	Vernon Taylor (3½ Rudge)	W. Cooper (3½ Bradbury)
J. C. Bennett Mitchell (2¾ Douglas)	Seymour Smith (3½ Norton)	W. O. Oldman (Bat)
H. M. Carter (2¾ Douglas)	Fred Dover (3½ Premier)	C. W. Wilson (Morgan runabout)
F. C. Wasley (2¾ Douglas)	A. E. Uffleman (3½ Humber)	Gordon B. McKechnie (8 Dot-Jap)
F. A. Hardy (Norton)	Richard Cussons (3½ New Hudson)	Horatio Wallis (2 speed Bradbury)
C. Maurice Down (2¾ Enfield)	E. Lester (3½ P. and M.)	H. C. Few (5-6 Clyno sc.)

Ladies' Section.

Mrs. A. Wade (3¾ Scott) | Mrs. C. C. Cooke (3½ Triumph)

Trade Team.

Class A. Machines up to 350 c.c.	Class B. Machines from 340 c.c. to 500 c.c.	Class C. Machines from 500 to 1,000 c.c.
W. W. Douglas (2¾ Douglas)	W. Pratt (3½ P. and M.)	F. W. Barnes (6 Zenith)
R. Holloway (2½ Premier)	J. Woodhouse (3½ Precision)	Hugh Gibson (3½ Bradbury)
Sam Wright (2¾ Humber)	W. F. Newsome (3½ Triumph)	W. H. Wells (7 Indian)
H. V. Colver (2¾ Enfield)	Roy W. Walker (3½ New Hudson)	Frank Smith (5-6 Clyno)
R. G. Mundy (2½ Singer)	F. C. North (3½ Ariel)	R. Lord (6 Rex sidette)
H. Graham Dixon (2¾ New Hudson)	Geo. Brough (3½ Brough)	F. A Applebee (3¾ Scott)
J. S. Holroyd (2½ Motosacoche)	J. H. Slaughter (3½ L.M.C.)	

Occasional Comments by "Ixion"

A Chaperone for the Scottish Trials.

Mr. Dickson, of Aberdeen, informs me that he intends to compete in the Scottish Trials, and that his wife will occupy the sidecar of his 8 h.p. Dot-Jap; so that any unmarried lady riders desirous of observing the proprieties may now rest assured that Mrs. Grundy will be satisfied.

It seems to me that it is the club's bounden duty to furnish a spare chaperone, and carry her on the official car. The responsibility at present laid upon Mrs. Dickson's shoulders is too great. What will happen if the 8 h.p. Dot-Jap should happen to drop out? Even if the club award gold medals to all ladies claiming full marks up to the moment of a chaperone's disappearance, the fair competitors will suffer the disappointment of being unable to complete the course.

I commend this burning problem to the attention of the M.C.P.A., which, I presume, imitates other "progressive bodies" in being suffragist, if not suffragette.

Sensitive Carburetters.

There are now several single-lever carburetters on the market, and I really wonder that some of the leading makers fail to realise how intensely these automatic vaporisers would appeal to perhaps fifty per cent. of the riding public.

I grant that with certain tunings any carburetter can be made quasi-automatic. But the usual tourist adjustment renders most two-lever carburetters excessively sensitive; and while this ultra-sensitiveness provides the opportunity of fierce joys to the expert, it is an unmitigated nuisance to the ordinary man.

I have just taken delivery of a beautifully tuned touring mount; it will not start easily except with a certain lever setting, which has to be learnt by experience; whenever it has to be slowed down in traffic, or on a hill, or round a corner, the air lever has to be brought back smartly to avoid a heart-breaking knock; while it is really a tricky business to obtain and to maintain correct mixture when the engine is roaring round at speed or up the foothills of a steep range.

These delicacies are the breath of life to me when I am in the saddle. I regard them as so many challenges to my intellect, and experience lurid joys in coping with them; but if I were a raw novice they would sicken me. They would lead to those involuntary dismounts in thick traffic and on the crucial knuckles of hills which set many a tyro against the pastime.

Now there are on the market several excellent one-lever carburetters which suffer from none of these delicacies, and provide almost as great a dynamic efficiency as my coquettish two-lever type. Why on earth do not the trade realise that half their customers would be better suited by an automatic carburetter, or at any rate a quasi-automatic setting of the two-lever type?

Drilled Pulleys.

When specifying a drilled pulley, it is well further to specify the gear ratio at which the holes shall operate. It is unsafe to drill a light pulley over the whole surface of the flanges, and if the selection of a gear be left to the makers, they will usually drill the holes at a height on the flanges which allows them to operate only for highish gears.

Now the holes are seldom urgently needed, except when a stiff hill has to be climbed in wet weather on a very low gear, say 5½ or 6 to 1; and, therefore, it is well to ask for the holes to be drilled low down on the flanges. A heavy pulley, however, may be drilled from top to bottom of the flanges.

Differentiated Valves.

Does anybody know why a certain famous engine maker, after using interchangeable inlet and exhaust valves for several years, has this year reverted to differentiated valves? Apparently the designer in question has come to the conclusion that it is impossible to construct a really satisfactory exhaust valve of the dimensions previously popular, for his 1912 exhaust valve has a much larger head and a thicker stem, and is much heavier than the inlet valve.

I hear of several users who were panic stricken when a rider broke his only exhaust valve and discovered that the spare was an inlet and did not fit. But the other kits luckily included spare exhausts, so that the stalled rider was sent on his way rejoicing. It would be interesting to hear if anybody has broken a standard type inlet valve on a first-class engine during the last two seasons. Personally, I find I break more overhead inlet valves than I have ever broken exhaust valves; but I have never within my memory snapped a "cheek by jowl" type of inlet valve.

To ask another question, has anybody unearthed a racing type of engine, with both overhead valves in the centre of the combustion head, which does not break its valves? The last engine of this type which I used became extremely perilous after about a thousand miles. Either valve, inlet or exhaust indifferently, was liable to emerge from the engine through the cylinder, or to descend into the engine through the piston head, with frightful velocity. Consequently I replaced the valves with new spares every 1,000 miles, until I encountered a sportsman willing to relieve me of the machine at a fair price.

The Value of Two-piece Footrests.

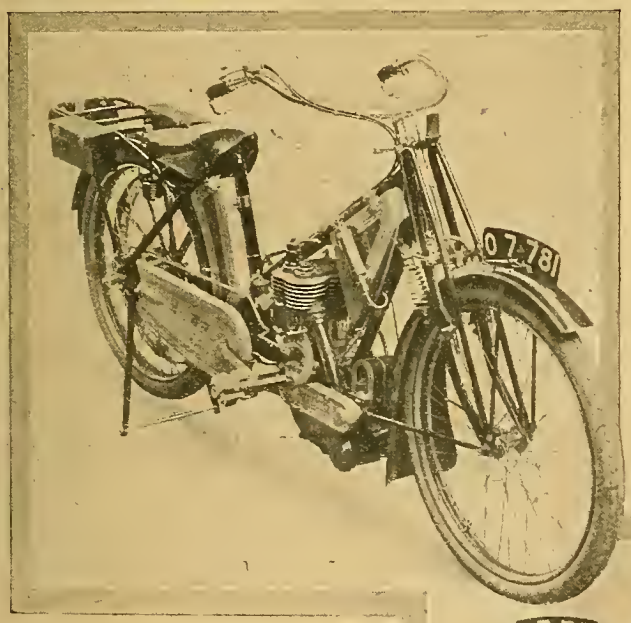
Details always enable the astute observer to identify the really brainy makers. I was studying two machines of different makes the other day, both of which possessed the new "drop" footrests, in which the pedal portion depends by a vertical arm from a short horizontal spindle higher up, to which it is attached in adjustable fashion by two notched faces and a lock nut.

One maker had collared the notion from a competitor in the most unintelligent fashion, without using

Occasional Comments—

an atom of intelligence—possibly he had none to use. At any rate he had utterly failed to see the possibilities of the little refinement. His upper spindle was of thin diameter, and of the same material as the vertical arm and pedal spindle. The vertical arm was 2½in. in length. I made enquiries among his customers, and found that if the machine was dropped one of two things happened—either the upper spindle bent, because it was no tougher or heavier than the lower spindle; or the screwed end of the upper spindle snapped off at the thread.

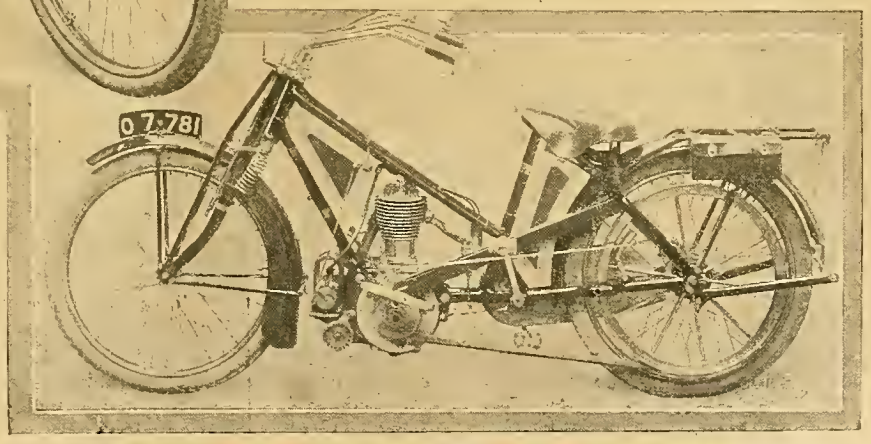
The other maker had a bubbling brain. His upper spindle was of stout, heavy stuff, and the lower spindle was of light steel of high tensile quality. As a result, when *this* machine was dropped, the lower spindle necessarily bore all the damage, which was thus confined to the smallest possible area, while its tensile quality enabled it to be readily straightened. Furthermore, the vertical drop-arm was 5in. long, so that a great range of adjustment, to suit riders of widely different heights, was possible. In such trifles must true greatness be sought and pursued.



Waterproof Magnetos.

A humorous commentary on the ways of men is provided by the recent delivery to me of a machine fitted with the latest type of "flood-proof magneto," carefully protected by its assembler with a cumbrous waterproof shield. Such suspicion ought not to exist between assemblers and electrical supply makers.

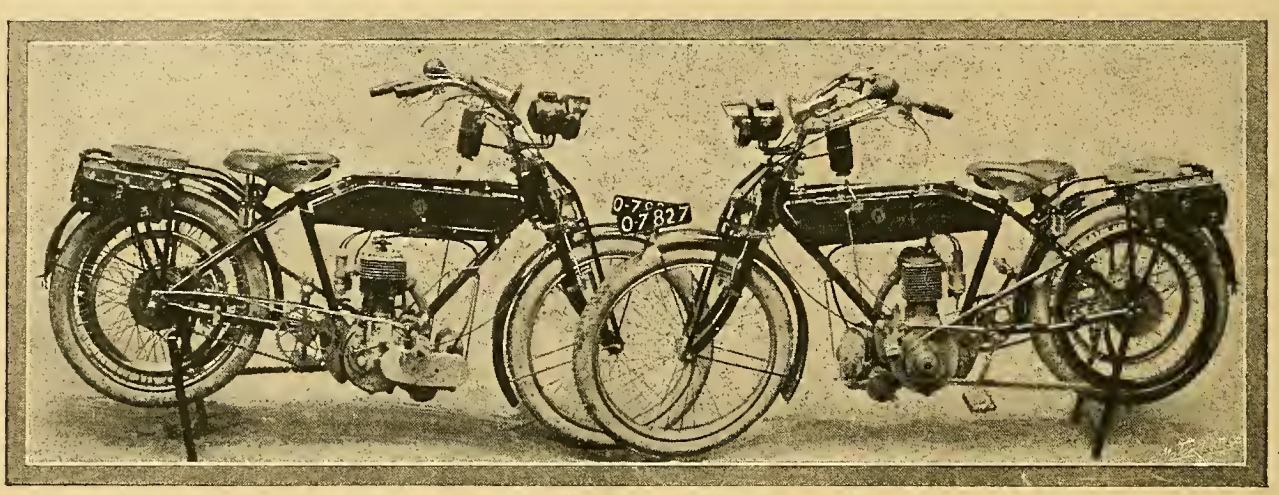
Does the magneto maker lie when he calls the machine "waterproof"? Or is the motor cycle manufacturer so soured by twelve years' experience of the business that he disbelieves other firms' slogans? I must solve the question by getting the housemaid to douse buckets of water over the magneto while I run the engine on the stand. I suspect that the motor cycle manufacturer is simply fat-headed, so I suppress his name!



A New Brough Ladies' Model.

WE have recently had the opportunity of examining a very neat open frame model, manufactured by W. E. Brough and Co., of Basford, Nottingham. The engine has a bore of 85 mm. and stroke of 88 mm., and has low compression so as to be easy to start. The top frame is duplicated, giving ample strength even for sidecar work. Neatness of construction and sound design characterise the whole machine. Both pedal cranks are straight and set close together, which renders pedal starting easy. The cylinder is a particularly neat casting, and has good air spaces round the valve ports. Two petrol tanks are fitted, one combined with an oil tank in the forward part of the frame, and one behind the saddle tube; both are connected to a common petrol pipe. A Villiers hub clutch is fitted, and both belt and pedal chain are well guarded. The low saddle position and compact appearance will be gathered from the accompanying illustrations. This firm has devoted considerable attention to the manufacture of ladies' machines, and those who prefer a powerful mount will find their wishes catered for in the Brough.

A Fictitious Rumour.



We have been asked to correct the report which has recently been circulated that W. E. Brough and Co. are not building their own engines. We can ourselves testify to the fact that we have seen the drawings, patterns, and castings in the rough of both twin and single Brough engines, and have seen the parts being machined and assembled. Moreover, there are several distinctive and original features in the 1912 Brough designs. We are asked to state that anyone is quite at liberty to prove the truth of these statements by a visit to the firm's works.

New lady's model Brough, fitted with 3½ h.p. single-cylinder engine and Villiers hub clutch.

ANOTHER NEW MODEL—THE HERCULES.

THE Hercules is a new motor cycle produced by the Hercules Cycle and Motor Cycle Co., of Coventry Street, Birmingham. The machine follows standard lines throughout, and may be fitted with 3½ and 4½ h.p. Precision and Sarolea engines. The frame has a dropped top tube, and is fitted with Saxon forks. Albion free engine or two-speed can be obtained to order. The tank is large and wide, and has a capacity of approximately two gallons. Lubrication is by tapless oil pump, but we understand that customers will, in future, be given the choice of a Best and Lloyd semi-automatic lubricator. Brown and Barlow carburetter and Bosch magneto, 2¼in. tyres and 1in. belts are included in the standard equipment. The whole machine, as will be agreed, has a neat and strong appearance.

Left and right side views of the new model 3½ h.p. Hercules-Precision.

MORE RECORDS FALL TO PRIVATE-OWNER'S PROWESS.

No more suitable day than Thursday, 18th inst., could have been chosen for record breaking. The sun shone warmly, its bright rays unhampered by any darkening shadow of an eclipse, while all around the track the trees were decked by the brilliant hues of early spring. Even in as good trim as Nature herself was Arthur Moorhouse's 7 h.p. Indian, 82.5 × 93 mm., 998 c.c. Timed by Mr. A. V. Ebblewhite, he accomplished a splendid performance, annexing seven records, four of which—250 miles, three, four, and five hours—are world's records, beating all American times.

Not the least wonderful part of Moorhouse's excellent ride was the marvellously consistent running of his machine. Between the 61st and the 68th laps his time only varied by ⅖s. Three consecutive laps were reeled off in 2m. 16⅖s. each—just under 72 m.p.h. Moorhouse stopped several times to change tyres and fill up his tanks, but the only untoward incident was the breakage of an oil pipe at the end of the four hours.

AUTO CYCLE UNION NOTES.

THE NEW SECRETARY.—Mr. T. W. Loughborough, A.M.I.C.E., the new A.C.U. secretary, begins his duties on May 1st.

AFFILIATIONS AND MEMBERSHIP.—The following clubs have become affiliated to the governing body: The Dudley and District, the Wakefield, the Ashbourne, and the Wath and District Motor Cycle Clubs, and the Mersey Motor Club.

R.A.C. REPRESENTATIVES ON THE A.C.U. COMMITTEE.—The following gentlemen have been elected to represent the Royal Automobile Club on the Auto Cycle Union Committee: Major F. Lindsay-Lloyd, Capt. H. E. Davidson, R.E., Capt. D. F. Nicholl, R.A., and Messrs. R. Todd, J. R. Nisbet, D. C. Bolton, G. F. Sharp, E. M. P. Boileau, L. M. Meyrick-Jones, H. P. E. Harding, M. G. Duncan, and C. A. Smith.

REFLEX LIGHTS.—On the suggestion of the Surrey M.C.C., the A.C.U. has decided to confer with the R.A.C. regarding circularising the various district councils throughout the county on the advisability of compelling all vehicles to carry reflex lights at night, as has been done in Warwickshire and other counties.

THE TOURIST TROPHY RACES.—The final draft of the rules have now been approved by the Isle of Man authorities. The engine sizes are up to 350 c.c. for the junior race, and up to 500 c.c. for the senior. Owing to Saturday, June 29th, being a market day, practising will not be allowed on the morning of that day.

Ten Years' Experience of the Pastime.

By F. STRAIGHT, late Secretary A.C.U.

I HAVE often been asked how it was that I first came to take a hand in the organisation of motor cyclists, and how it was that I continued to stand by and to have faith in the future of the sport and pastime during the troublous times through which the industry passed in the years 1904 to 1906. One of the reasons I first took an interest in motor cycling is due to the fact that as an official handicapper of the National Cyclists' Union I was in constant touch with sports promoters on the look out for means of increasing their gate.

During 1902 I had handicapped several motor cycle races at Canning Town, and seeing the amount of interest I was taking in the new type of vehicle, the Automobile Club approached me with a view to organising a motor cycle section of the Club, with the result that in January, 1903, I was to be found installed on the Club premises in charge of the motor cycle section.

The year 1902 was a very important one from a racing point of view. Races were held on the following tracks: Aston, Canning Town, Coventry, Plymouth, Putney, and Uxbridge. In the same year at the Crystal Palace Motor Show, February 14th to 22nd, a motor cycle section was arranged, and Ariel, Excelsior, Minerva, Quadrant, Mitchell, Derby, Chapelle, New Hudson, Phœnix, Humber, Werner, and several other machines were on view, whilst trial machines were running in the grounds.

It was in August of the same year that the Automobile Club held the first purely motor cycle race meeting on the Crystal Palace Track. One of the events was the hour scratch race in which C. Jarrott, T. H. Tessier, H. Martin, F. W. Chase, E. J. Steele, and J. Van Hooydonk were competitors. Jarrott, who was riding an 8 h.p. De Dion tricycle, experienced a lot of trouble, and finally retired, the winner being J. Van Hooydonk, who, of course, rode a Phœnix and covered 42 miles 290 yards in the hour, winning by over four laps.

The writer.

A Weird Scene at the Crystal Palace.

Perhaps, however, the most exciting event at this meeting was a ten miles handicap, which was run in one heat. There were twenty riders, and the present day motor cyclist can imagine what an extraordinary scene was presented with so many riders on a small track. The roar of the engines was deafening, and the pace at that time was considered terrifying. Some of the competitors had their exhaust boxes glowing a bright red, and this in the gathering darkness looked very weird, and I have certainly never seen anything to approach it since.

Soon after I took up my duties at the Automobile Club steps were taken to organise a club which would take over the complete control of motor cycling under the auspices of the A.C.G.B.I. This resulted in the formation of the A.C.C. The idea occurred to me soon after the formation of the A.C.C. to promote a long distance reliability trial, to which the committee agreed, and the first 1,000 Miles Trial was the outcome. It extended over a fortnight, the first day being taken up with the weighing and other preliminaries, whilst the last day consisted of a speed trial on the Crystal Palace Track. The Crystal Palace was chosen as the centre for these trials, and in the grounds was erected a huge marquee for the accommodation of the competitors' machines, which at the close of each day's run were placed there in charge of officials who were on duty all night.

Unfortunately, the weather was of the most dreadful description, rain falling heavily almost every day, with the result that the ground became sodden, and the interior of the marquee was nothing but a quagmire. Fortunately the competitors took matters very philosophically.

In view of the suggestion recently made in *The Motor Cycle* that the concluding day of the 1912 Trials should consist of a long distance test at Brooklands, it is worthy of note that in 1903 the competitors on the last day of the Trials had to ride five miles on the Crystal Palace Track.

First International Cup Race.

The first competition for the International Cup, which was held on French roads in 1904, was not by any means a British success. Our team consisted of H. Rignold, W. Hodgkinson, and T. Silver, the first-named being the only one to complete even one lap. This race was chiefly notable for the fact that somebody had lavishly strewn the course with nails, and tyre after tyre came to utter grief.

The following year an eliminating trial was held in the Isle of Man, and for some reason or other the start had been fixed for 3 a.m. The weather at that time, however, was very hazy, and it was decided to delay the start for half an hour. One of the conditions was that machines should not exceed 110 lbs. in weight, and it was amusing to see the riders when their machines were put on the scales and found to be overweight filing away all possible parts in order to reduce the weight. The rubbers were taken off the pedals, side plates discarded, holes bored in the pulleys and belt rims; in fact, the majority of machines were so weakened that it was not to be wondered at

Ten Years' Experience of the Pastime.—

that only two completed the course, viz., J. S. Campbell (6 h.p. Ariel) and H. A. Collier (6 h.p. Matchless), the former winning by 1m. 16s. over a distance of 120 miles, which was covered in 4h. 9m. 36s. George Barnes was one of the competitors in this race. He made a very brilliant start from Quarter Bridge, darting away like a shot out of a gun, but we saw nothing more of him, and it was reported that at the first bad corner he was travelling too fast to get round, so went straight on and in at the door of a cottage.

Reminiscences of Bygone Trials.

It was in the Six Days' Trials of 1905, when they were held in the West and South-west of England, starting from and finishing in London, that I had two instances of what a keen rider will do in pursuit of his favourite hobby. The first instance to which I refer is that of F. W. Applebee, who, not wishing to compete, very kindly offered to officiate, and to him was given the unthankful task of riding behind the competitors and reporting at night upon the stragglers. I well remember how on one or two occasions he reported himself to me at the hotel in the early hours of the morning with a modest and cheery, "Well, I've got here," without a complaint against those riders who had been the cause of his late arrival.

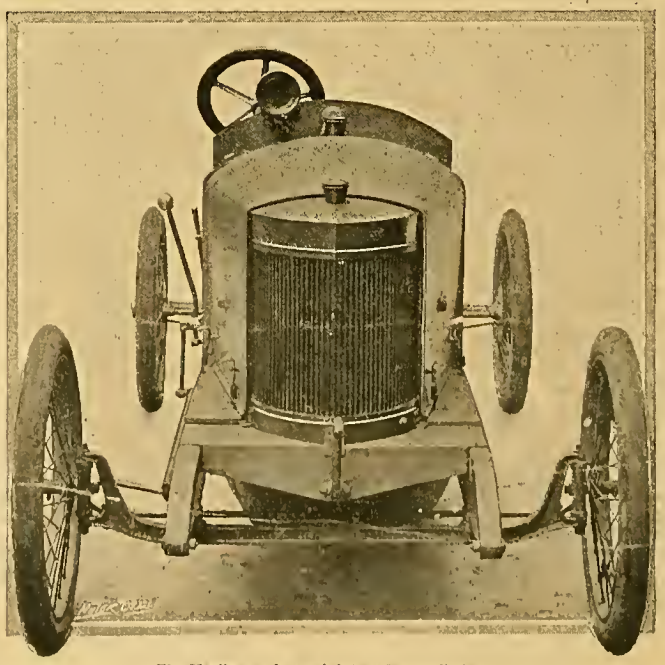
On another occasion I rode with him from London to Great Yarmouth, and on the return journey, soon after leaving Lowestoft, something went wrong with the machine I was riding, which neither of us could locate. He would not hear of leaving me behind, and eventually towed me all the way to London.

I have often wondered how, in the early days of competitions, when machines were far from reliable, busy business men would enter for the Six Days' Trials and take them as part of their summer holidays. It was in the 1905 Trials that A. V. Baxter, a Warrington rider, told me that he was taking his holiday that way. Well, I have never seen a man work so hard before or since on a holiday. I think Baxter had all the troubles that could possibly befall a motor cyclist on that trip.

It was in the first Land's End to John-o'-Groat's Trial (1906) that Miss Muriel Hind made her first appearance in a long distance event. Early on the Sunday morning previous to the start, the noise of a tricar was heard outside the hotel, and we found that Miss Hind had arrived, having driven through the night alone, the lateness of her arrival being due to the fact that she had been rendering assistance the previous evening to another competitor who had met with a mishap on the way down and had to be left in charge of a doctor.

Of course, such a trial as this is full of incidents, but one feature of the event which appealed particularly to me was the fact that after the trial was over, and we were on our way back to London on the following day (Sunday), we met competitors on the Ord of Caithness still making their way to John-o'-Groat's, determined to complete the trial over the classic route even if they were a day behind time.

What we Owe to the Magneto.



There is no doubt that the introduction of the high-tension magneto in such a reliable form as we have it to-day and have experienced it from about 1905-1906 has been the salvation of the motor cycle. In the early days most of our troubles were caused through faulty ignition, due very often, it must be admitted, to carelessness in not properly looking after the accumulators.

The more recent happenings in the motor cycle world are comparatively fresh in the minds of the majority of my readers, so there is no need for me to recapitulate them, but I can assure present day riders that, although we experienced a lot of trouble in the early days, we got a very great deal of amusement and enjoyment out of our favourite hobby.

A FOUR-CYLINDERED CYCLECAR.

THE FIRST OF ITS TYPE.

The cyclecar class is, we understand, about to receive a new entrant into its midst in the shape of the new small Marlborough car, sold by Messrs. T. B. André and Co., 5, Dering Street, New Bond Street, W., which is an exact *facsimile* in miniature of a up-to-date motor car. It is fitted with a four-cylinder monobloc engine 60 × 100 mm., but we understand that a model is to be built fitted with an engine of 55 mm. bore, which will bring it just within the 1,100 c.c. limit, while the chassis weight does not, we understand, exceed 6 cwts. The Marlborough is, of course, rather more expensive than the ordinary type of cyclecar, in that it is far more a car than a cycle as in design it follows standard car lines throughout; it is one of those vehicles which could be purchased with confidence that it will give the greatest satisfaction to its owner. The engine is water-cooled and has a racy-looking V-type radiator, as will be seen from the accompanying illustration. It will be obvious to all motor cyclists that an evenly balanced four-cylinder engine is likely to be very successful in a cyclecar, as a light vehicle of this type is subjected to considerably more road vibration than heavier cars which hold the road better.

The Marlborough, a miniature four-cylinder car.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street E.C., and should be accompanied by the writer's full name and address.

A Long Tour on Lightweights.

Sir,—The enclosed print of my wife and myself may interest you. It was taken at the commencement of a six weeks' holiday in North Wales, during which we covered about 600 miles, climbing both Aberglaslyn and Llanberis Passes.

At no time did the machines receive any attention, excepting tyres and the twisted belt on the lady's.

Photograph accompanying "H.C.'s" letter.

As my wife had never ridden a motor cycle before this tour, and my machine was an absolutely new and untried one, I think this speaks volumes for the Motosacoches on which we were mounted. H.C.

The Sidecar and the Coal Strike.

Sir,—In consequence of the coal strike, a large number of trains in various parts of the country were suspended, and nowhere was this more so than in the Manchester district. As a result, the morning mails from Manchester to Glazebury and Kenyon were interfered with, and as no coaches run in the direction of these places the mails had to circulate *via* Leigh; at this point the mails were met by the Brothers Timms with their motor cycle and sidecar and conveyed to their destination. The enclosed is a photograph taken on the 12th inst. F. TIMMS.

Hydrogen Peroxide in Acetylene Generators.

Sir,—I notice in your issue of April 11th that you are still having correspondence on the employment of peroxide of hydrogen in acetylene generators

I should like to draw your readers' attention to the fact that by an Order in Council, dated May 15th, 1900, it is illegal to use peroxide of hydrogen in the water of an acetylene generator As your readers will know, the use of peroxide of hydrogen results in the acteylene gas being mixed with a small quantity of oxygen. The following is an extract from the Order in Council above referred to:

"Acetylene when in admixture with atmospheric air or with oxygen gas in whatever proportion and at whatever pressure and whether or not in admixture with other substances shall be deemed to be an explosive within the meaning of the Explosive Act.

"And whereas it is in the judgment of Her Majesty expedient for the public safety that acetylene in admixture with air or oxygen, when an explosive within the meaning of this Order, shall be prohibited."

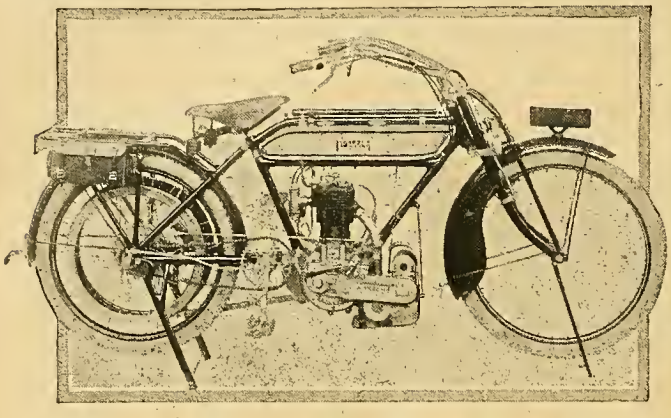
I shall be pleased if you can see your way to publish this letter, as, in the interests of the acetylene industry, I am desirous that the practice of using peroxide of hydrogen in acetylene generators should be discontinued.

H. S. SMITH,
ACETYLENE PUBLICITY, LTD.

Compression Ratio.

Sir,—I was much interested in your article on the above subject. I have used a system for several years which I consider is at least as simple and probably more accurate than the majority of methods. All the apparatus necessary is a quantity of the usual cylinder oil and a glass measure, the size I use myself being a photographic measure of one pint capacity and costing 1s.

The method is as follows: Thoroughly decarbonise the combustion space, and assemble the engine, less the tappets and centre plug of the cylinder, and bring the piston to top of stroke. Heat the oil and carefully fill the measuring glass with the same. Fill the combustion space with this oil, rocking the engine meanwhile to dispel all air. When this is completed, read off on the scale on the glass measure the quantity of oil used. Bring the piston to the bottom of stroke, and proceed as before. Compare the ratio that the first named quantity bears to the second, and the result will be the ratio of compression. L.F.P.



[This method is very similar to the shot system described by our contributor.—ED.]

Sidecarists who conveyed the mails from Manchester to Glazebury during the coal strike.

Another Episode of the Coal Strike.

Sir,—No doubt during the recent strike you have received dozens of letters regarding the use of motor cycles for business and pleasure purposes, but, nevertheless, I would add my experiences.

A neat-looking but comparatively unknown make—the Monarch.

On Saturday, March 30th, I had instructions to go to Dundee from Hull, but, owing to the difficulty of getting through by rail, I decided to go by road, leaving on Sunday at breakfast time. In addition to extra clothing, I carried nearly a hundredweight of goods, part on the carrier, and the remainder on the handle-bars.

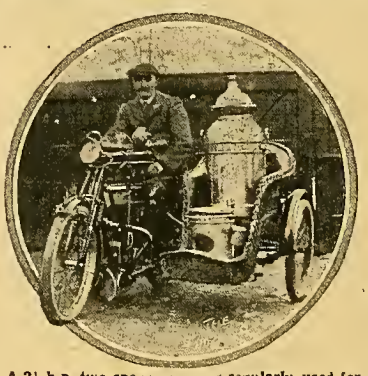
It rained at starting, but afterwards brightened, and I quite thought I should have a nice ride. However, I was very much mistaken, as it never stopped raining until I reached Berwick-on-Tweed at 7 p.m. It was a gruelling ride, and belt-slipping made matters worse, and I was very grateful to my Hutchinsons for standing to their work. I had a skid at York which bent my footrest and broke some glass that I carried, and a pedal. I stayed the night at East Linton, and got to Edinburgh early on Monday. The ferry people refused the machine at Granton, so I started for Queen's Ferry. Before reaching it, however, I met friends, and so did not cross until 2.45 p.m. I made a call at Cupar, Fife, and this made me miss the 5.30 ferry from Newport by a few minutes, but still I reached Dundee in good time.

After finishing my work, I started on the return journey on April 7th. The ferries took up a lot of time, but I reached Edinburgh in time for dinner. Sundry calls delayed my start, but eventually I made a non-stop to Berwick in the rain, and soon after I gave in and hoped for a better day on Monday.

Those who had the misfortune to be out on Easter Monday know what my ride must have been. Three times I was blown over, and just outside Darlington a tree fell on me. Fortunately, it was rotten and shattered into hundreds of pieces without doing any damage. A little further on I had my first puncture. After that all went well until within twenty miles of Hull, when I punctured again. This time I was not so fortunate in getting away, so put in my spare. Eventually I reached home little the worse for the worst ride I have ever had.

Throughout the whole time my Monarch pulled finely, and the only miss was when my coat got on to the plug.

I enclose a photograph of my machine, which I do not think is as well known as it might be. Its many sterling qualities induce me to say I would never go by rail again if I could get there on my motor cycle. S.M.G.



Consumption Comparisons.

Sir,—I have read Mr. Pickett's letter with some interest, although I have tried no experiments so far on my cycle. The results I have obtained in my motor boat with petrol consumption may throw some light on the matter. The boat is a 4 h.p. Daimler (old type) fitted with the same carburetter as the company apparently supplied with the motor. I was not satisfied with the petrol consumption, and had considerable trouble with valves and plugs. We did a good deal of experimenting with the old carburetter, but got very little better results. We then decided to scrap it, and in its place fitted an American make of carburetter with a central jet, this being quite common with boat work, as the level of the petrol in the jet is independent of the level of the boat.

We then fitted a silencer close to the engine, and made a jacket for it, and from this jacket supplied hot air to the carburetter. If this new carburetter be supplied with cold air the results are very little different from the old one, but with hot air the saving in petrol is most marked.

For the previous year the petrol cost £1 15s. 6d., for last summer it was reduced to 11s. 4d. The boat was not used quite so late in the summer as the previous year; but, owing to the brilliant weather last summer, while I was able to use it, it had a lot of use. I estimate the saving to be about 50%, probably more, and we had no trouble with valves or plugs. The air supplying the carburetter is so hot that it is not possible comfortably to bear the hand on the pipe, while the pipe from the carburetter to the engine is about the temperature of the surrounding air, showing that a lot of heat is being absorbed in the gas-making process.

My theory is that now the engine is being fed with a true gas, easily exploded, with perfect combustion; before it was getting a damp vapour with imperfect combustion. The majority of motor car carburetters are fitted with hot air pipes, and all the air passing the jet is heated, only the extra air being cold, and I am inclined to think this has more to do with their greater efficiency than water-cooling the engine. Anyway, as I am not satisfied with my present consumption of petrol in the motor cycle, I am going to try some experiments on similar lines. K.

A 3½ h.p. two-speed Humber regularly used for delivery of milk.

The Sidecar for Milk Delivery.

Sir,—Enclosed is a photograph showing the utility of the motor cycle. The owner, Mr. Edwards, of Kington, Herefordshire, has been using the 3½ h.p. two-speed Humber and sidecar for the purposes of delivering milk daily.

By this means he is able to dispense with a horse and trap, which would otherwise be required.

E. M. TURNER.

Disqualifications at Leathley Bank.

Sir,—I am writing in the hope that you will find room for the following statement in regard to the facts leading up to my disqualification in the standard single-cylinder class at the hill-climb recently held by the Harrogate and District and Herts. County M.C.C.'s. It will be remembered that I won in this class, making the climb in 63½s. I rode the same machine which I have used throughout the whole of last year, the present season, and also during the winter; it is a strictly standard Ivy machine, and I think I can claim

More married couples who motor cycle—the Rev. and Mrs. H. Stanley Tibbs. The machines are a Triumph and a Douglas.

to have been almost religiously careful with regard to its equipment.

I have invariably ridden the machine with ordinary upturned handle-bars, footboards, shield for the magneto, mudguards, tool bags, the machine being, in fact, an exact replica of a standard Ivy.

These facts were duly pointed out to the officials, but the only satisfaction I got was a statement to the effect that no ordinary touring engine could climb the hill in the time that I took, so that, presumably, had I made this climb at a slower speed, I could still have won and not have suffered the indignity of disqualification. I now wish to state that the engine was a standard competition Ivy-Precision engine, and that it does not vary in the slightest degree from those fitted to the machines we sell, except in so far that it has seen a good deal more work than most.

It seems to me distinctly unfair ruling that a rider should lose the result of his care and experience because of efficiency which is apparently above the normal.

H. C. NEWMAN.

Clashing of Dates.

Sir,—I notice a paragraph in the "Current Chat" page of your issue of last week referring to the clashing of the passenger trial arranged by my club—the North-West London M.C.C.—with that organised by the Birmingham Club.

I should be glad if you would publish this letter in order to make it quite clear that this unfortunate clashing was not in any way due to my committee, as the original date of the fixture was settled at the meeting of secretaries at Olympia in November.

We have always made a point of avoiding interfering with other clubs' affairs as much as possible, and when, in spite of the date being approved at this meeting, another club fixed a trial for the same day, we applied in January to the A.C.U. to have our date altered to May 18th, which, at that time, was an entirely open date. The permit was granted to my club quite a long time ago, and I trust you will make this clear so that the Birmingham Club will not feel that we have intentionally arranged anything which would be likely to interfere with the success of their own competition in regard to which we wish them the best results.

It seems to me that some arrangement might be made in regard to protecting the interests of clubs in such matters. The meeting of secretaries at the Olympia was intended for this purpose, but, judging by what transpires each year, very few feel morally bound by the arrangements.

H. J. POOLEY,
Captain North-West London M.C.C.

Three and Four-wheeled Cyclecars.

Sir,—It would appear from Mr. H. George Morgan's letter in last week's issue of your paper, that there is nothing on four wheels that is any good whatever, and that the *summum bonum* of all self-propelled vehicles is embodied in the three-wheeler. I notice that he says that anybody who has driven a three-wheeler and a four-wheeler is entitled to give his opinion, which will differ from the opinions of other writers, and then proceeds to give us so-called facts, which he says may be more useful than theories.

He says, firstly, "A three-wheeler won very easily the only cyclecar race yet held at a speed of about 59 m.p.h., the three-wheeler, in fact, 'first' and the rest nowhere."

This is perfectly true, as I myself witnessed the race, but Mr. Morgan omits to say that the three-wheeler was fitted with a special J.A.P. engine giving over 14 h.p., fitted with overhead valves, and was, in fact, an absolute racing vehicle. One is perfectly willing to admit his second point, that his three-wheeler was absolutely steady, whereas the only four-wheeler which approached it in speed, as he says, "snaked" badly, and finally turned over. One admits that this vehicle, being an old pattern four-wheeler, was much too lightly built for racing purposes, but the point is open to doubt whether it would have turned over had not the front tyre on the right wheel burst.

His third point, that because no four-wheeled vehicles have been entered for officially long distance reliability trials, is no criterion that four-wheelers are not as reliable as any three-wheeler.

W. H. STIRLING.

[We have received other letters on this subject written under the assumption that the writer of the letter published last week is the maker of the Morgan cyclecar. His initials, however, are H. F. S., not H. G. Morgan.—ED.]

Carrying a Camera.

Sir,—I am thinking of carrying my camera (Klimax with Ross lens) on the top tube of my motor cycle. I intend making a box exactly to fit it, and should like any suggestions from other riders who carry cameras. Also I should like to know if the lens will be damaged by the vibration.

GORDON M. WILSON.

[The general opinion of those who combine motor cycling with photography is that the best place to carry a camera is slung on the rider's back.—ED.]

Pillion Seats.

Sir,—I notice several letters under the above heading asking the best method of mounting and starting a motor cycle with a passenger on the carrier, and would refer your readers to the following tip. Let the passenger take his [her] seat, and push off in the ordinary way! When the engine fires, place the left foot on the pedal, sit on "side saddle," and raise the right foot over the tank. This can easily be done with a little practice, thus enabling one to start almost anywhere. By the way, I would warn your readers against the use of any but the best tyres for this kind of work, as I narrowly escaped a nasty accident owing to the bursting of a tyre (made by one of the oldest tyre manufacturers) which had only run about 200 miles. Since last August I have been using a "Palmer Cord," and have done over 1,500 miles of passenger carrying in addition to my ordinary riding.

A. E. PAINE.

Private Owners and Trade Riders. Three Classes Suggested.

Sir,—If, as Mr. Phillpott says, "Many men who sign a declaration that they are not in any way assisted by the trade are actually so assisted in various ways," why does he not, being evidently in the "know," report such "shamateurs" and do two good turns, viz., (1) to his own and kindred clubs who would reap the benefit of double fees, and (2) by making motor cycling a pure sport.

I use Mr. Phillpott's name as an argument, not as an attack. Can he be truthfully classed as anything but a "trade rider"? (By his letter I presume he desires to fall into Class 2.) He is entirely devoted to the motor trade, and is the local agent for the machine he rides. He has skilled mechanics under him who are always at his call to tune up and do sundry jobs that an amateur would either have to do himself (in not such a perfect manner) or pay to have done.

Two classes should be sufficient for us—(1) Trade riders, *i.e.*, makers' riders, or any rider who receives any sum or even present for riding any machine, using any accessory, or for even wearing So and so's famous goggles; (2) men who ride their own machines, and spend their own money on its upkeep, and who pay for their own accessories.

PERCY P. SYVRET.

SUMMARY OF CORRESPONDENCE.

Mr. Stenson Cooke (secretary A.C. and M.U.) writes that a Mr. L. Colley, rider of a 6 h.p. Rex sidette, has written him but has omitted his address. If this should catch his eye will he write again?

Mr. H. D. Jones writes that in the Birmingham M.C.C. competition to Perth and back he took the wrong road at Stirling, and finally reached Birmingham some thirty minutes before time, not threequarters of an hour late as stated in the official results published last week.

Mr. Southcombe May, hon. secretary of the M.C.C., 34, Gower Place, W.C., informs us that numbers of his club letters go astray through their being incorrectly addressed to Gower Street. Will members and other readers kindly note?

"E.M." (Brighton) wishes to secure a companion for a long Continental motor cycle trip this year to Japan via Siberia, returning the same route or a different one. Letters addressed as above, c/o The Editor, will be forwarded to the right quarter.

NOTICE.

The Editor disclaims all legal responsibility in any way for loss of copy in the form of manuscript, drawings, or photographs submitted to him. Rejected manuscript, drawings, and photographs will only be returned provided a stamped addressed envelope is enclosed for the purpose.

TIME TO LIGHT LAMPS.

April 25th	... ...	8.10 p.m.
,, 27th	... ...	8.13 ,,
,, 29th	... ...	8.16 ,,
May 1st	... ...	8.20 ,,

Last Week-end.

A gloriously fine week end marred by two most regrettable accidents.

M.C.C. Silencer Trial Cancelled.

The committee of the Motor Cycling Club announce that, owing to insufficient entries, they regret being obliged to cancel the open silencer trial which was advertised to take place on Saturday next. Motor cyclists generally will be sorry to hear of this, as improvements in silence are generally desired.

Sutton Coldfield and Mid-Warwickshire A.C.

An open race meeting for lightweight motor cycles, singles, and twins. T.T. Junior (1912) limit, will be held at Aston track on May 4th, at 3 p.m., and will comprise the following events: Three-mile scratch race and five-mile handicap. The handicapping will be three yards per mile per cubic centimetre difference. The latest date for receipt of entries is the 29th inst.

Memorial to the late A. J. Moorhouse.

It is proposed to erect some sort of memorial to the late A. J. Moorhouse, whose sad death is reported in our account of Saturday's B.M.C.R.C. meeting. The proposal will be discussed at the R.A.C. Association Rooms, 89, Pall Mall, W., on Monday next, the 29th inst., at 8 p.m., when all motor cyclists interested are invited to be present.

Hill-climb in Leicestershire.

The opening hill-climb of the Leicester and District M.C. was held at Beacon Hill, Woodhouse, on the 5th inst. A strong wind was blowing down the hill, so fast times were few. An electrical timing apparatus was used, and results on formula are:

Class 1 (lightweights).—1, H. Petty (2½ Singer).

Class 2 (single-cylinder touring machines).—1, R. C. Wainwright (3½ Campion); 2, A. L. Barker (3½ Clyde); 3, Mrs. K. H. Simpson (3½ Rudge).

Class 3 (twin-cylinder touring).—1, E. Goodin (6 Clyde).

Class 4 (touring sidecars).—1, T. O. Judge (7 Indian).

Class 5 (T.T. roadster).—1, H. Petty (3½ Singer); 2, E. Folwell (3½ B.S.A.); 3, W. P. A. Chapman (3½ Triumph).

Class 6 (open).—1, E. Goodin (6 Clyde); 2, W. M. Matthews (6 Zenith); 3, W. G. Glover (6 Rex).

Winner of first round of Judge Cup.—H. Petty (2½ Singer).

Winner of novices' prize.—M. Simpson (3½ Rudge).

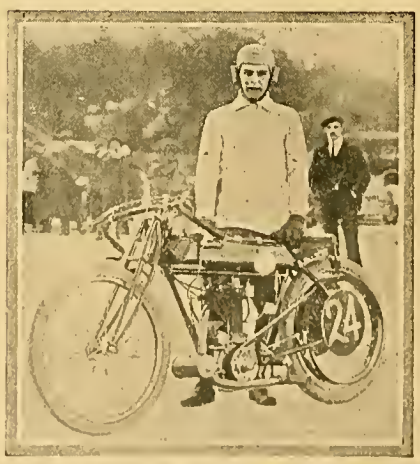
An Irish Test Hill.

Can any reader tell us the average and also the steepest gradient of Knocksaughey Hill, the venue of the Belfast and District M.C.C. hill climb on Easter Monday? We are assured that the hill averages 1 in 4, which means that the rise is from sea level to about 1,100 feet, in 1,550 yards.

Inquest at Weybridge.

At the Coroner's inquest on the body of poor Moorhouse, held at Weybridge last Monday, the jury returned a verdict of "Accidental death," and added that no blame attached to anyone.

An eye witness of the accident, who was also a competitor, reports that Moorhouse was not bending down to adjust anything on his machine—he appeared to swerve off the top of the banking where he had steered the machine to get extra speed before entering the straight.



South Australian Speed Trial.

On March 9th the M.C.C. of South Australia held its second speed test over a flying half-mile on one of the country roads near Adelaide. A strong side wind was blowing, which somewhat reduced the speed. The following were the results:

Single-cylinders up to 500 c.c.: 1, F. R. Limb (3½ h.p. Calthorpe), 22⅕s.; 2, H. H. Ragless (3½ h.p. T.T. Triumph), 32⅖s.; 3, L. R. Linton (3½ h.p. Rudge), 33⅕s.

Twin-cylinder Class: 1, A. Bartholomaeus (6 h.p. Rova-Jap), 30⅗s.; 2, F. R. Limb (6 h.p. Rova-Jap), 31s.; 2, C. Lindsay (6 h.p. Jap), 31s.

Great interest was taken in the relay race from Adelaide to Sydney, 1,148 miles, which has already been mentioned in *The Motor Cycle*.

D. C. Bolton with the 3½ h.p. Rudge on which he won the three-lap scratch race.

SPECIAL FEATURES.

The Mobilisation Scheme.
Bristol M.C.C. Hill-climb.
Ten Years' Experience of the Pastime.
New Pattern Machines.

Marseilles to Nice Race.

We are informed that Cuzeau's time was three hours twenty-two minutes twelve seconds, not three hours fifty-three minutes as given in the last issue. This makes him first in his class (under 500 c.c.) and second to Berlié in the entire race, a very fine performance for so small an engine (the Terrot).

R.A.C. Touring Guides.

Now that the new road scheme of the R.A.C. has been put into practical operation, it is interesting to note the financial assistance given by some of the affiliated clubs. The Scottish A.C. is placing fifty men on the roads under its own jurisdiction. The A.C.U. has given £100. The Hampshire Club is considering the gift of a similar amount. Other donations are: Bradford A.C. £45. Commercial Motor Users' Association £30. Northants Club £27. Yorkshire A.C. £25. Kent A.C. £25. Coventry and Warwickshire £21. Ladies' A.C. £25, while the Halifax and Somerset Clubs are giving 2s. 6d. per head.

Ninety-five Miles an Hour.

We hear from America that E. Hasha, riding an eight valve Indian on the new track at Los Angeles, has beaten all records from one to ten miles. The times are:

		m. s.			m. s.
1	mile	0 37⅘	... 6	miles	4 1⅗
2	miles	1 18⅖	... 7	miles	4 42⅖
3	miles	1 59	... 8	miles	5 24
4	miles	2 39⅗	... 9	miles	6 5
5	miles	3 20⅕	... 10	miles	6 45⅘

The speed of the first mile is equal to over ninety-five miles an hour, and the average speed for ten miles is 88.71 miles per hour.

The Motor Cycle in South Africa.

Mr S. F. Edge has just returned from a motor car trip in South Africa, where he was accompanied by Mr. Charles Jarrott. In a recent issue of *The Autocar* Mr. Edge gave a summary of his experiences, and in reply to *The Autocar* representative's query regarding the use of motor cycles in South Africa, said: "I foresee a huge future there for motor cycles, for the reason that they can run on the Kaffir tracks, but though they should be well powered, they should not be too fast. A 3 h.p. engine with two-speed gear should be about the thing."

Yorkshire Hill-climb.

The Bradford M.C.C. will hold its annual hill-climb on May 18th. Mr. Felix Scriven tells us that there will be about nine classes, two of which will be confined to amateurs. The electrical timing apparatus, which proved so satisfactory last year, will be again used.

The Mobilisation Scheme.

The writer of our military notes, who is an Army officer, further explains the scheme for the great mobilisation test. Hundreds of replies have been received through *The Motor Cycle* in response to the original appeal published in these pages on April 4th

A Scottish Invitation.

The Edinburgh M.C.C. has extended an invitation to the Auto Cycle Union to send a team of eight crack riders to take part in a hill-climb to be held on a Saturday in June. Those anxious to take part should send in their names to the secretary of the A.C.U.

The New T.T. Regulations.

The rules for the Tourist Trophy Races are now available. Most of the Junior T.T. manufacturers are increasing the capacity of their engines to the full limit = 350 c.c., and we have heard of several twin-cylinder engines of 500 c.c. in preparation for the Senior race. It would appear that the A.C.U. will have to rely for its major support from private owners.

A.C.U. Competitions Committee.

The Competitions Committee of the Auto Cycle Union has made the following recommendations to the General Committee:

UNOFFICIAL RECORDS.—That the following recommendations be adopted: "Any owner, manufacturer, dealer, agent, or driver taking part in or directly connected with any trial or competition, otherwise than under regulations made by the Auto Cycle Union, and obtaining extensive advertisement therefrom, shall be deemed guilty of a breach of these rules, *i.e.*, the competition rules, and shall be suspended." This is based on the rule found at the head of the R.A.C. Competition Rules.

TRACK RECORDS.—That the records set up by the late Mr. A. J. Moorhouse on April 18th be confirmed.

TWO-STROKE ENGINES—IMPORTANT DECISION.—That the handicap imposed on two stroke engines (air and water-cooled) be removed.

OFFICIAL TIMEKEEPER.—That Mr. A. G. Reynolds be reappointed official timekeeper for 1912.

PERMITS.—That permits be granted to the Tunbridge Wells M.C.C. to hold three and five miles handicap races and a three miles scratch race for machines fitted with engines not exceeding 76 × 76 on Whit-Monday; and to the Sutton Coldfield A.C. to hold a three miles scratch race and a five miles handicap race for Junior T.T. machines on May 4th. It was recommended that these permits should be granted provided the machines are not geared higher than 5 to 1, and that this gear should not be exceeded for any race held on a grass track; also that no permit should be granted to hold any race on a track which the A.C.U did not consider suitable and safe.

FUTURE EVENTS

April 27.—Bristol B and M.C. Open Hill-climb
„ 27.—M.C.C. Open Silencer Trial
May 4.—Coventry and Warwickshire M.C. Open Reliability Trial.
„ 4.—Mersey M.C. Open One-day Trial.
June 1.—Birmingham M.C.C Open Hill-climb
„ 1.—Liverpool A.C.C. Open Hill-climb.

A special heading for competition announcements will be found at the end of the miscellaneous advertisement columns.

Open Amateur Hill-climb.

The Sutton Coldfield and Mid-Warwickshire A.C. is working hard to make the open amateur hill-climb a success. There will be four classes (under 350, under 520, T.T. machines, and unlimited). The entries close on May 10th. This is claimed to be the first event of its kind, and it is hoped that amateurs will support it enthusiastically.

Chased by Two Lions.

The Livingstonia News for April mentions an adventure two motor cyclists had recently while returning from the Zomba (Central Africa) Coronation ceremonies. The riders, Mr. and Mrs. Macdonald, the former a magistrate at Mzimba, were chased for five miles by two lions, which showed no fear of the noise made by the engines, and galloped after the motor cyclists with evident determination to kill them. The lions were finally outdistanced, and the riders, suffering greatly from nervous strain, reached their home in safety.

Reduced Speed Limits.

Local Government Board inquiries have been held during the past week or two into applications for reduced speed limits at the following places: Windsor, Lambeth, Lindfield, and Swiss Cottage.

A Dual Success.

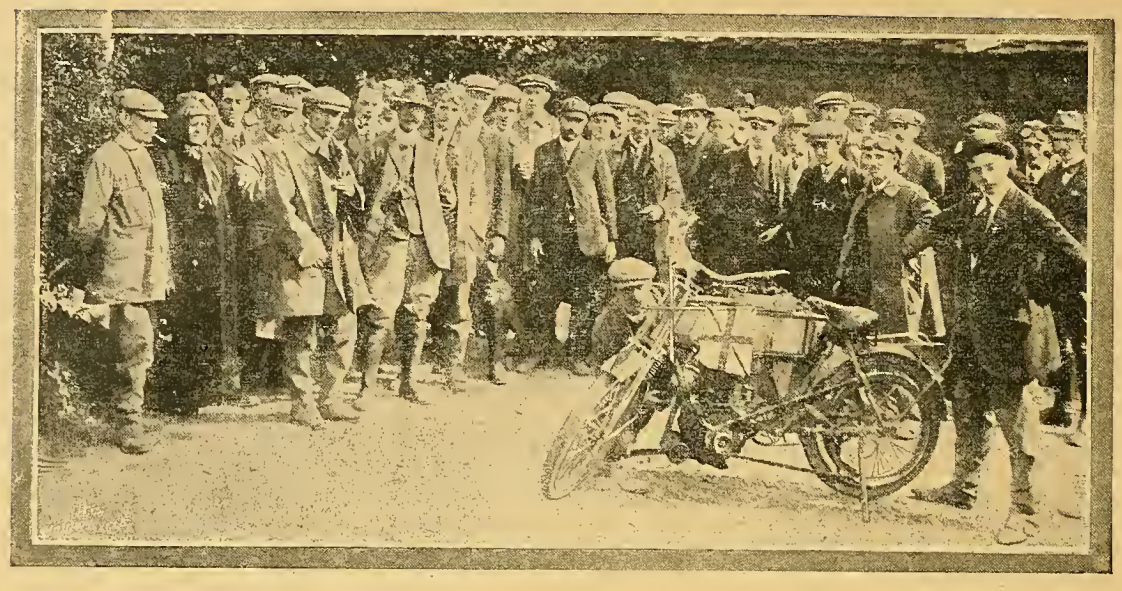
In addition to winning the Tranmer Challenge Trophy at the Staxton Brow hill-climb, D. Bradbury (3½ Norton) also won the New Hudson Challenge Cup for the best performance on formula on a standard single-cylinder machine.

Coventry and Warwickshire M.C. Open Trial.

Entries for this event will close next Saturday, the 27th inst. The route, which will be a secret until the day, will follow a sporting course, and will be well marked. A representative entry has already been secured.

Motor Cycles in the Postal Service.

We are informed by the Coventry Postmaster that it has been decided to continue the experiment of the Rover motor cycle in the Coventry and district postal service for a period of twelve months. The exact running costs will be ascertained at the close of the trial.



M.C.C. Team Competition.

Entries, or definite promises to enter, for the M.C.C. team competition for *The Motor Cycle* cup have been received from the following clubs Birmingham M.C.C., Bradford and District M.C.C., Bristol M.C.C., Coventry and Warwickshire M.C., Derby and Northants M.C., Bristol B. and M.C., Liverpool A.C., Mersey M.C.C., Oxford M.C.C., Sheffield and Hallamshire M.C.C., North-West London M.C.C., Notts and District M.C.C., and South-East London M.C.C.

BRISTOL M.C.C. OPEN HILL-CLIMB AT GREAT CHEW.

F. W Barnes (Zenith) near the top of the hill. The photograph shows how the spectators crowded on to the course, which was none too wide at this point.

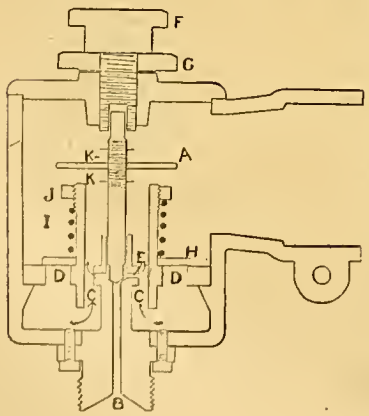
Birmingham M.C.C. All Equal Hill-climb. R. W. Duke, surrounded by his fellow members, adjusts the "old crock" at the foot of the hill. The engine with which it is fitted is an old White and Poppe.

The Scottish Auto Cycle Union.

Successful Conference at Stirling.

Nearly thirty representatives of motor cycle clubs met at the Golden Lion, Stirling, last Saturday, to discuss the formation of a Scottish Auto Cycle Union. Mr. John Gow, president of the Glasgow M.C.C., took the chair, supported by Messrs. R. J. Smith and J. R. Nisbet. The clubs represented were: Edinburgh, Glasgow, Perth, Dundee, Scottish Border, Cathcart, Falkirk, Leven and District, Wishaw and District, and West of Scotland.

The discussion was opened by Mr. J. S. Fulton (Glasgow), who dwelt on the necessity for such an organisation and the exceptional opportunity which was now offered. By themselves they would have to put in many years' work before they could obtain the benefits which co-operation with the Scottish A.C. secured them at the outset. He accordingly moved that such a body be formed. The matter of title aroused some discussion, a section desiring the body to be termed the Scottish Motor Cycle Union, but on taking a vote the majority favoured the Scottish Auto Cycle Union.



Mr. R. J. Smith then submitted a draft constitution, which was formerly approved of, and a provisional committee was then formed to discuss this in fuller detail. This committee was elected as follows: Messrs. J. Gow, W. Macmillan, J. R. Nisbet, jun., J. S. Fulton, F. Salvesen, C. McGregor, Bruce Syme, A. F. Sinclair, Thomson, Craig, Whitehouse, and Shepherd, with Mr. R. J. Smith as secretary *pro tem.*

The question of reciprocity was raised, and Mr. J. R. Nisbet, without speaking officially, assured the meeting that full recognition would be given by the A.C.U., while, owing to the connection with the Scottish Club, they would have all the advantages of R.A.C. and A.C.U. membership when they crossed the Border.

With regard to licences for forthcoming competitions, it was decided that the Scottish A.C. should issue them in the interim.

A SIMPLE CARBURETTER WITHOUT A FLOAT CHAMBER.

This carburetter differs from the usual pattern in having no float, the petrol supply being controlled by a needle-valve which is operated by the suction of the engine. The petrol enters by the passage B, which is closed by the needle-valve. The valve A is lifted by the suction of the engine allowing petrol to enter by the jets E (three in number), and air through the choke tubes C C. The petrol supply can be varied by the milled nut F. As the engine speed increases extra air is admitted through the ports D D, the supply being controlled by the valve H and the spring I, the tension of which is adjusted by the nut J. The throttle consists of a gunmetal sleeve (not shown), which revolves inside the vacuum chamber, and is controlled by a Bowden wire.

We are informed by the maker, Mr. B. Cooper, Braintree, Essex, that the carburetter has had a thorough testing on the road, and has proved most satisfactory in use, and quite automatic. It has the merit of simplicity, and if it will do all that is claimed should become popular.

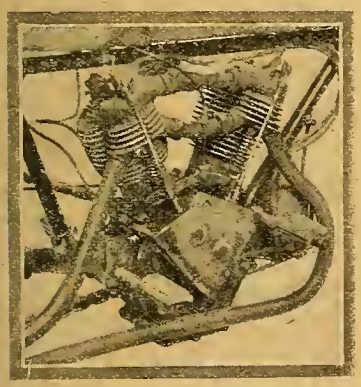
J. Chater-Lea on his 8 h.p. Chater-Lea cyclecar. He gained third place in the cyclecar race at Brooklands last Saturday.

The late Mr. A. J. Moorhouse.

ALL those who follow the motor cycle movement closely will be grieved to read in our report of the B.M.C.R.C. meeting of the death of Mr. A. J. Moorhouse. He was one of the best sportsmen who ever mounted a motor bicycle, a genuine private owner, and a keen and skilful rider. He was popular with all who knew him, and one of those men we can ill afford to lose. His name first became known to our readers as a prominent member of the Manchester Motor Club, and when he came to London last autumn for Messrs. Waygood and Sons, the well-known lift manufacturers, and took his seat on the Auto Cycle Union Committee, his fellow workers felt he was a real acquisition.

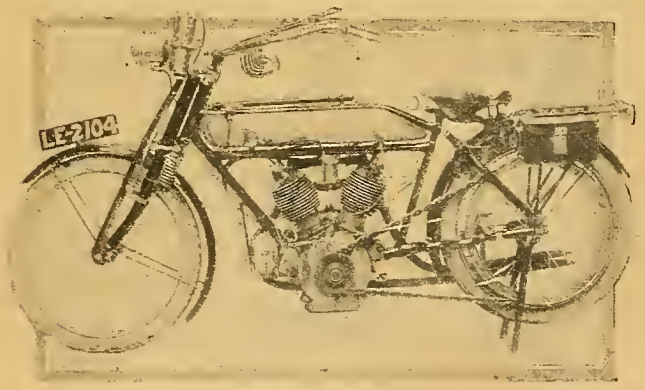
He was a good speaker, clear headed and well balanced, while his knowledge of competition work and of club life rendered him an extremely useful member of committee. Despite the short time he was on the committee he did excellent work, and was largely instrumental in bringing about the reform of which the Union was so badly in need. In fact, he became an appreciated ambassador from the North.

The late A. J. Moorhouse. He met with a fatal accident at Brooklands last Saturday.



It is impossible to express in words the sympathy we feel for his widow and children, but we are sure that every motor cyclist who knew him, and even those who merely read of his prowess on the track and on the road, will join us in this. His death is a sad loss, and all the sadder as he was the type of man we most want in our competitions and in the control of the sport. It is some small comfort to be able to record that he was suddenly and painlessly taken from our midst while engaged in the sport he loved before all else.

Among the late Mr. Moorhouse's principal successes may be mentioned that he was the winner of the Jarrott Cup in 1911, third in last year's Tourist Trophy Race, while only a week ago, as is reported elsewhere in this issue, he beat no less than seven records. The hour record Class E—70 miles 1,388 yards—still stands in his name.



A later account of the fatal accident mentions that the unfortunate rider crashed into a telegraph post which bears the imprint of his goggles. The cause of the accident was that splendid self-confidence without which daring deeds can never be done.

THE EAGLE 10 h.p. MOTOR BICYCLE.

THE engine of this machine, which we had the opportunity of seeing last week, is designed for sidecar and cyclecar work, and for these purposes it should be eminently suitable. It is made by the Eagle Motor Manufacturing Co., at Shepherd's Bush, who also make worm-driven back axles, three speed and reverse gear boxes, steering parts and clutches for cyclecars. The size of the engine is 85 mm. bore by 88 mm. stroke, cubic capacity 998 c.c. The cylinders are unusually smooth castings. There is a system of double exhaust which allows the exhaust gases from each cylinder to pass under the exhaust valve of the other as well as down its own exhaust pipe to the rear. The cylinders are slightly offset and compression is fairly high. The inlet valve is of the mechanically operated overhead type. The plugs are placed in the centre of the cylinders, and the compression taps at the side where they are readily accessible. The magneto timing is independent. The Benton and Stone method of lubrication is used combined with a sump at the bottom of the crank case. The small end has already been described in our columns. The gudgeon pin is keyed to the connecting rod and rocks in wide bearings attached to a disc which screws into the top of the piston and is then secured by means of a wedge bolt and nut. The machine is equipped with a Senspray carburetter.

Power plant of the Eagle. Note the system of double exhaust.

The Eagle 10 h.p. Motor Cycle.

B.M.C.R.C. Second Monthly Meeting

A BEAUTIFUL afternoon, June-like as to its temperature, with hardly a breath of air, graced the second B.M.C.R.C. meeting. There was one really excellent event, the three lap 500 cc. race, the cyclecar race was also interesting, but little did we think the proceedings would terminate so tragically. It is hard, indeed, to describe what happened in the other events owing to the terrible accident that occurred to poor Moorhouse, and the knowledge that his name will never appear again in a B.M.C.R.C. programme.

The first events on the programme were the first 1912 time trials over the kilometre and mile, flying start. Certificates are issued for the best performance in the various classes, and a gold medal will be awarded in each class for the best aggregate performance during the season. Competitors rode in the usual direction round the track, and were expressly told to keep outside the 50 feet line. Despite these instructions Stanhope Spencer, S. Wright, Oldman, and Axford kept too near in during their first try, and were each given another. On the occasion of his first attempt Wright's start afforded considerable excitement, as by some means or other the handle-bar slipped out of his hand, but after a tough struggle he cleverly regained control and succeeded in mounting his machine.

Results:

CLASS B.—Up to 350 c.c.

	Kilometre. Secs.	Mile. Secs.
1. G. E. Stanley (1 Singer, 69×80 mm., 299 c.c.	38.46	62.16
2. N. A. Ayres (1 Singer, 69×80 mm., 299 c.c.)	39.56	64.13
3. S. Wright (2 Humber, 60×60 mm., 340 c.c.)	47.84	77.42

CLASS C.—Up to 500 c.c.

1. G. E. Stanley (1 Singer, 85×88 mm., 499 c.c.)	31.89	52.34
2. D. C. Bolton (1 Rudge, 85×88 mm., 499 c.c.)	32.52	52.71
3. W. O. Oldman (2, Bat-Jap, 76×54.5 mm., 498 c.c.)	34.07	53.67
4. Stanhope Spencer (1 Rudge, 85×88 mm., 479 c.c.)	34.52	55.89

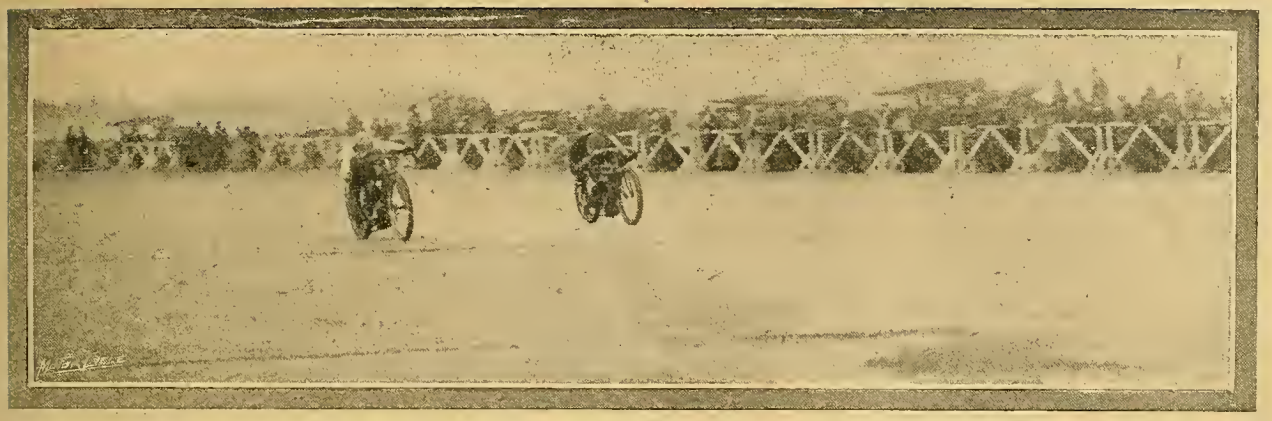
Stanley's Singer was provided with a neatly fitted foot-operated oil pump.

CLASS D.—Up to 750 c.c.

1. S. T. Tessier (2 Bat-Jap, 85.5×64 mm., 741 c.c.)	31.56	51.63
2. H. Hunter (2 Corah-Jap, 90×58 mm., 750 c.c.)	32.99	54.55

CLASS E.—Up to 1,000 c.c.

1. C. R. Collier (2 Matchless-Jap, 90×78 mm., 998 c.c.)	28.04	45.71
G. F. Hunter (2 Zenith-Jap and sidecar, 90×77.5 mm., 998 c.c.)	34.47	60.99



Collier's machine was fitted with a special oil pipe to the front cylinder, which could be closed by means of a tap. The end had been removed from both silencers.

The second event on the programme was the three lap 500 c.c. scratch race. Distance, 8 miles 269 yards. First prize, silver cup presented by Singer and Co., Ltd.; second prize, the Club's silver medal; third prize, the Club's bronze medal. Starters were barred except in the case of Woodman, who has only one leg, and Alan Hill, who is lame. Spencer got away first. The start was quite an impressive sight.

Close Finishes in the Three Lap Scratch Race.

In the first lap Stanley established a good lead, but Bolton was making a good fight. Spencer, Oldman, Franklin, Timson, Alan Hill, South, Woodman, Guiver, and Axford was the order of the rest. In the second lap Stanley and Bolton continued their fight for first place, Spencer and Oldman some way behind struggled for third place; and the rest came by in the following order: South, Timson, Alan Hill, Guiver, Franklin, Axford (whose engine was misfiring badly), and Woodman.

The finish was most exciting, Bolton beat Stanley by barely a length, Spencer came next some way behind with Oldman close on his heels, then an interval and a hard struggle between South and Timson. Hill and Guiver after a further interval came next almost neck and neck. Axford brought up the rear, while Woodman was last with a partially seized piston. It was one of the best motor cycle races ever seen on Brooklands, and the way in which the first six finished in pairs was quite extraordinary.

D. C. Bolton (Rudge) and G. E. Stanley (Singer) finishing close together in the three-lap scratch race.

Result :

	m. s.
1. D. C. Bolton (1 Rudge, 85×88 mm., 499 c.c.) ...	7 37⅗
2. G. E. Stanley (1 Singer, 85×88 mm., 499 c.c.) ...	7 37⅘
3. W. S. Spencer (1 Rudge, 85×88 mm., 499 c.c.) ...	7 59⅘
W. O. Oldman (2 Bat-Jap, 76×54.5 mm., 498 c.c.)	
W. D. South (1 Rudge, 85×88 mm., 499 c.c.)	
S. D. Timson (1 Rudge, 85×88 mm., 499 c.c.)	

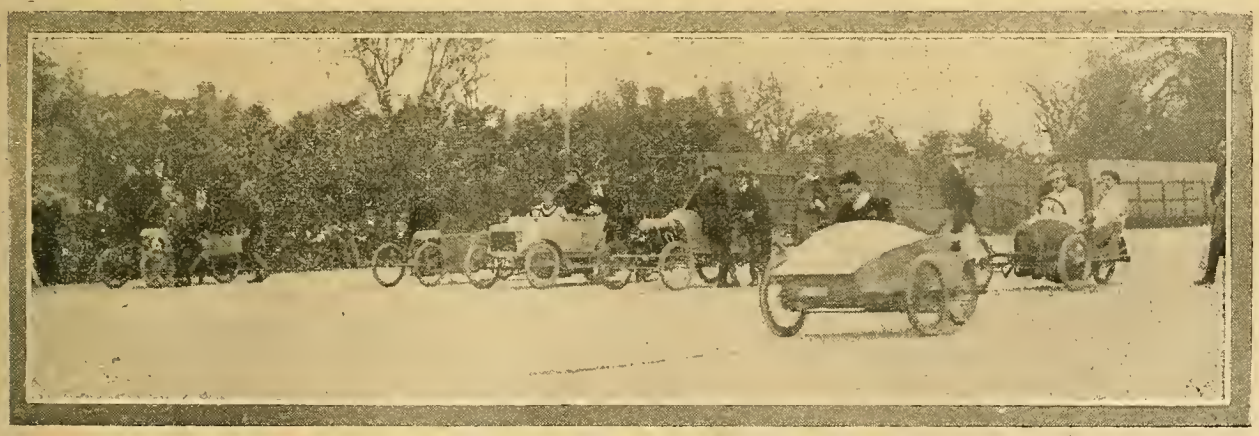
Woodman rode the machine entered by McNab. Bolton's Rudge was fitted with an Amac carburetter and Timson's with a Cap.

The Cyclecar Race.

The Five-lap Cycle Car Race next figured on the programme; distance 13 miles 1,035 yards; first, second, and third prizes, the club's gold, silver, and bronze medals respectively. A *début* was made by the A.C. Mighty Atom racer, the first of the new models turned out. It was fitted with the new type of engine seen at the Show with a larger bore, extra radiating surface, and larger flywheels. A Senspray carburetter was fitted. The silencer was carried transversely about 18in. behind the back seats, and on each end thereof a number plate was carried. Other newcomers to Brooklands were the G.W.K. and the Chater-Lea.

First lap: The A.C. and the Autotrix passed at the end of their first lap before the Morgan and Bedelia started. They were followed by Chater-Lea, G.W.K., and Bedelia and Morgan. In the second lap A.C. was leading, but Autotrix pressed him hard. Chater-Lea took third place, and was followed by Bedelia and Morgan.

Third lap: Autotrix had just passed A.C., and the rest came by as follows: Chater-Lea, Morgan and Bedelia.



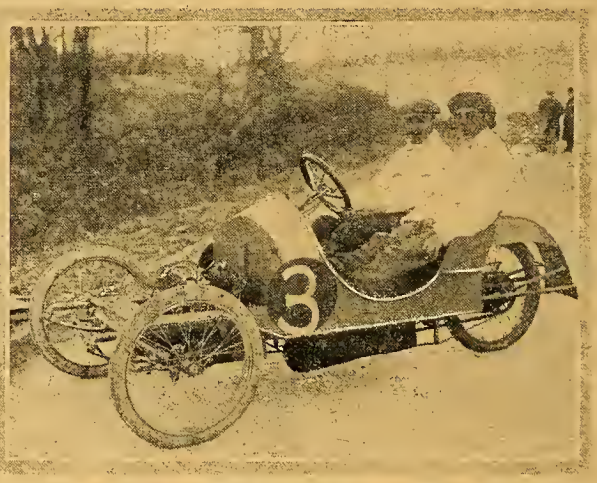
In the fourth and fifth laps the same order was preserved. The Morgan was clearly the fastest machine, but could not pull up the allotted handicap.

Result:

	Start. M. S.	Time. M. S.
1. G. Wadden (2 Autotrix-Jap, 85×85 mm., 964 c.c.)	5 20	17 45⅕
2. F. Hill (1 A.C., 95×102 mm., 723 c.c.) ...	4 45	18 40⅕
3. J. Chater-Lea (2 Chater-Lea, 85×85 mm., 964 c.c.)	—	18 51¼
H. Martin (2 Morgan-Jap, 90×77.5 mm., 984 c.c.)	scr.	—
H. Ward (2 Bedelia, 84×100 mm., 1,100 c.c.)	1 0	—

A Tragic Ending to the Hour Race.

It is now our sad duty to record what happened in the hour all-comers' race. This was divided up into the usual classes. Moorhouse's machine was running badly just before the start, and he was the last man to line up. However, he seemed to get away fairly well, and soon got into his stride. The big Indian was pulling well, and was reeling off laps at 70 and 71 miles an hour. At the seventh lap Moorhouse was leading the throng, and was followed by Stanley Class C), H. A. Collier and Tessier (both in Class E).



Scene at the start of the five-lap cyclecar race at Brooklands last Saturday.

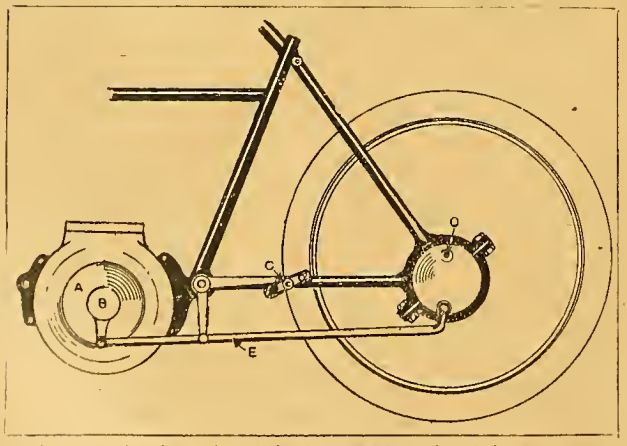
B.M.C.R.C. Second Monthly Meeting.—

Moorhouse was seen bending down apparently trying to fix his silencer which was loose. The next thing we saw was a big blaze at the beginning of the railway straight, a great flame and a column of smoke ascending in the air like a funeral pyre. People realised a machine was on fire, whose no one knew; not a soul could be seen even through powerful glasses. We could only guess that it was Moorhouse.

The first authentic news was from Oldman, who said Moorhouse was seriously injured and that the race was stopped. Eventually Mr. T. W. Loughborough told us that poor Moorhouse was lying on his face stone dead in the ditch adjoining the track, and his machine was on the grass completely burned out. It is supposed that he was bending down trying to fix the silencer when the front wheel struck a bump in the track; the machine swerved, got completely out of control, and flung its gallant rider to the ground. Death was mercifully instantaneous.

No one saw the accident, and its cause can only be surmised. The event cast a sad gloom over Brooklands, and a glorious afternoon terminated in the first tragic ending of a motor cycle track meeting in England. We have been connected with motor cycle racing in Great Britain for the past nine years, and it is interesting to note that poor Moorhouse's terrible accident is the first which has terminated fatally to a motor cycle competitor on Brooklands track.

The Autotrix-Jap cyclecar entered by G. Wadden, winner of the five-lap cyclecar race.



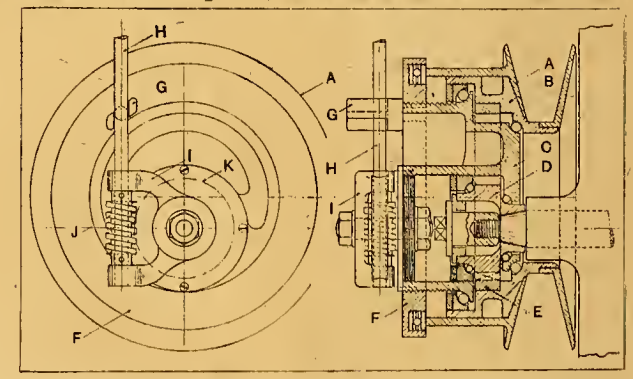
TWO NEW VARIABLE GEARS.

THE BARNETT.

THE writer recently had the opportunity of an afternoon's run on a motor cycle fitted with a variable gear invented by Mr. Barnett, an engineer of Derby. A few particulars of this test may be of interest to readers of *The Motor Cycle*.

To describe the gear: The back wheel is mounted in an eccentric, and backward or forward movement of the rod E gives a corresponding movement of the rear wheel in relation to the frame. The front portion of the rod is attached to a small arm working cam faces B.

The action of the cam faces sliding against each other opens or closes the pulley flange A. The thrust at B is taken by two ball thrust bearings, over which a neat dust cap is fitted. The gear is infinitely variable, and incorporates a free



engine. It is also adaptable for pedal or hand lever operation. In the accompanying illustration, downward pressure of the pedal C gives low gear and free engine, whilst depression of right pedal causes rear wheel to travel forward, closes up pulley flange, takes up slack of belt, and gives high gear.

The method of mounting the rear wheel in frame ensures absolute lateral rigidity, whilst the gear is claimed to be foolproof, and to be the most accessible variable gear yet introduced. The relative movement of rear wheel and pulley flange is such that the belt is always at proper tension. Gears obtainable 3½ to 1 to free engine.

The working of the gear came quite naturally, as pressure on either pedal for high or low is all that is required. On two occasions I found it quite easy to crawl past a flock of sheep at about three or four miles an hour, accelerating in a few yards when the road was clear again. A.B.B.

THE P. AND P.

THIS new variable gear, invented by Mr. Rowe, is now in its experimental stage, and will be put on the market by Messrs. Packer and Prentis, Roden Street, Ilford, E. Referring to the diagrammatic sketches, the small gear wheel D is fastened to the engine-shaft, and engages with the internally-toothed gear of the pulley B, which is thus caused to rotate about the eccentric C. The gear is raised by turning the rod H, which, by means of a worm gear J, revolves the eccentric C about the

centre of the engine-shaft. This movement alone would alter the tension of the belt, but at the same time the part F, which is kept from revolving by the engagement of G and H, moves along a thread on the eccentric, and forces the flange A towards the inner flange of the pulley, thus raising the gear. A and B rotate together, being connected by feathers.

The gear is infinitely variable between its limits, no jockey pulley is required, nor is it necessary to slide the back wheel. The entire gear will weigh about 8 lbs., and the moving parts 3 lbs. A free engine can be obtained by bringing the eccentric right back. The belt then will rest or slide on the bottom of the flange.

THE BRISTOL M.C.C. HILL-CLIMB.

W. Cooper starting the first competitor, W. W. Douglas (2¾ h.p. Douglas), who later secured second place in Class 1.

E. Kickham (2¾ Douglas) rounding the first bend in the lightweight class in which he gained third place.

THE above club held a successful hill-climb on Saturday last at Chew Hill, about seven miles out of Bristol. The day's sport was marred by a sad accident to E. W. Cheshire (Triumph), who started a wobble and failed to correct it on the top corners. He took the bank at high speed and sustained severe injuries to his head. Fortunately, a doctor was on the spot, and he reported severe concussion but no bones broken. Cheshire was removed in a semi-conscious condition to the Bristol Hospital by a car, and on Sunday morning had not regained consciousness, although it is reported that he may possibly recover.

Three Awkward Bends.

The hill was a sporting one about threequarters of a mile in length, getting gradually steeper towards the summit, which was probably 1 in 7 to 1 in 8. The surface was excellent, and there were no bad corners, but three bends which were awkward at high speed, especially as throughout the afternoon some difficulty was experienced in keeping spectators off the course. At one time the competitors refused to ride unless the course was better cleared. Mr. W. Cooper's energies seemed inexhaustible, and had it not been for his powerful lungs and sharp wit, aided by the hon. secretary, Mr. P. Grout, there would have been more bad accidents. After Cheshire's accident Newsome and Crawley (Triumphs) did not ride.

The Douglases had a day out in their own country, and did extremely well. It was wonderful to watch the little twins roaring over the top of the hill. W. W. Douglas took a toss on the last bend, but fortunately no damage was done.

CLASS I.—Junior Touring Twins.

		s.
1.	F. Ball (2¾ Douglas)	50⅞
2.	W. W. Douglas (2¾ Douglas)	50⅜
3.	E. Kickham (2¾ Douglas)	50⅘

This was a clean sweep for the Douglas.

CLASS II.—Junior Touring Singles.

Newman, riding a 70 × 90 Ivy-Precision, made a very fast climb. F. V. West (Levis) came up well, but appeared under-geared.

		m.	s.
1.	H. Newman (2½ Ivy-Precision)	0	55⅗
2.	F. W. Barnes (2¾ Zenith)	0	56
3.	R. Holloway (2½ Premier) ... ... / F. G. Edmond (2 Humber)	1	4⅘

CLASS III.—Senior Touring Singles and Twins.

This time Newman was riding the 3½ Ivy, and again scored by a good lead, the next four times being very close together, Kickham's Douglas being very noticeable, and only one second slower than an engine of far greater capacity.

H. C. Newman (3½ h.p. Ivy-Precision) nearing the top of Chew Hill, the scene of last Saturday's Bristol M.C.C. Hill-climb.

A Triumph rider passing the finishing point on Chew Hill last Saturday.

Mrs. Simpson (3½ h.p. Rudge) who made fastest time in Class 5.

		s.
1.	H. Newman (3½ Ivy-Precision)	42 3/5
2.	Vernon Taylor (3½ Rudge)	47 4/5
3.	S. Crawley (3½ Triumph)	48
4.	W. F. Newsome (3½ Triumph)	48 3/5
5.	E. Kickham (2¾ Douglas)	49 3/5

CLASS IV.—Fixed Gear Touring Singles.

Besides the three fastest times, H. Spanton and V. Taylor (Rudges), J. Cocker (2½ Singer), R. H. Clark (Corah), and the unlucky Cheshire all made good and fast climbs, Cheshire's accident occurring after rounding the first bend of the S curve.

		s.
1.	S. Crawley (3½ Triumph)	42 3/5
2.	H. Newman (3½ Ivy-Precision)	43 1/5
3.	W. F. Newsome (3½ Triumph)	47 3/5

CLASS V.—Ladies.

Unfortunately there were only three entries in this class. However, all three made good clean ascents, though worried by a cart. Mrs. Simpson was twice sent back to the start after being baulked on the hill, and consequently started with a hot engine.

		m.	s.
Mrs. Simpson (3½ Rudge)		1	7 4/5
Mrs. P. Grout (2¾ Douglas)		1	16 2/5
Mrs. Gibb (2¾ Douglas)		1	33 3/5

CLASS VI.—Racing Unlimited.

Some fast times were accomplished in this class. W. G. McMinnies rode his Triumph splendidly, and with Holloway (Premier), in a later class, shares the honour of the finest ascents from a rider's point of view.

		s.
1.	F. W. Barnes (8 Zenith)	42 1/5
2.	H. Newman (3½ Ivy-Precision)	43
3.	W. G. McMinnies (3½ Triumph)	46 4/5

CLASS VII.—Passenger.

Neither the Morgan nor the Williamson which were entered turned up. It is reported that the latter had had an argument with a hay cart and was still suffering.

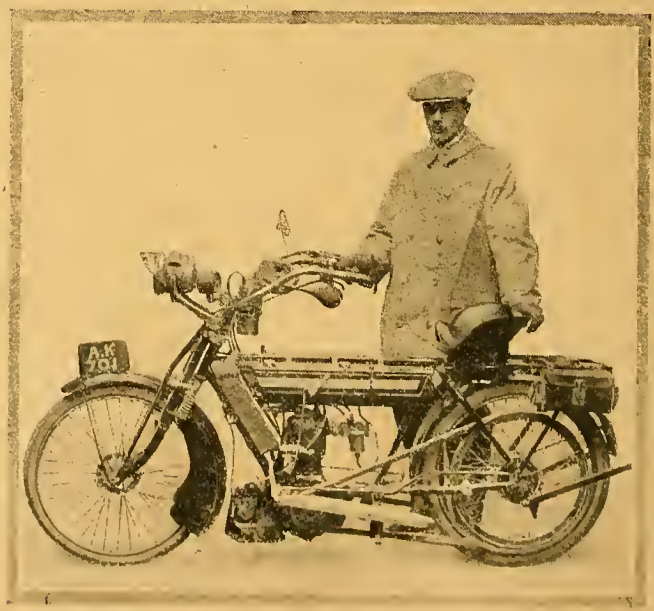
		M.	S.
1.	F. W. Barnes (6 Zenith sc.)	0	59 4/5
2.	A. B. Wade (6 Zenith sc.)	1	9 2/5
3.	H. G. Dixon (3½ New Hudson sc.) ...	1	15 3/5
4.	R. Lord (6 Rex sc.)	1	39 1/5

CLASS VIII.—Racing Singles.

This was another win for Newman closely followed by Holloway and McMinnies. P. Maurice (Premier) made a good climb, but had the misfortune to break a belt close to the top.

		s.
1.	H. Newman (3½ Ivy-Precision)	44 1/5
2.	R. Holloway (3½ Premier)	46 1/5
3.	W. G. McMinnies (3½ Triumph)	47 2/5

CLASS IX.—Junior Racing Twins or Singles.



F. Ball's Douglas was again a winner, and both the Humber and Enfield came up fast.

		s.
1.	F. Ball (2¾ Douglas)	50 3/5
2.	W. Moore (2¾ Humber)	51 4/5
3.	H. Colver (2¾ Enfield)	53 1/5

CLASS X.—Club.

This class was run for club members only, and some good performances were made.

		s.
1.	P. Mathews (3½ Ivy-Precision)	48 4/5
2.	F. Clement (3½ Singer)	53 2/5
3.	W. Douglas (2¾ Douglas)	53 3/5

IN FAVOUR OF WATER-COOLED MOTOR CYCLES.

R. Vernon C. Brook, hon. sec. of the Birmingham Motor Cycle Club, with his neat-looking 3½ h.p. water-cooled Precision-engined two-speed machine. On this mount Mr. Brook gained a gold medal in the ever to be remembered Birmingham to Perth and back reliability trial. The performances of his Precision have entirely won Mr. Brook over to water cooling.

The Bristol M.C.C. Hill-climb.—

The formula results in connection with this competition were calculated on Professor Callender's or the A.C.U. formula, and are as follow:

CLASS I.—Junior Touring Twins.

		Fig. of merit.
1.	E. Kickham (2¾ Douglas)	57.9
2	P. Phillips (2¾ Douglas)	59.3
3	W. W. Douglas (2¾ Douglas)	60.2

CLASS II.—Junior Touring Singles.

1.	F. W. Barnes (2¾ Zenith)	49 2
2.	F. G. Edmond (2 Hunber)	51.3
3.	R. Holloway (2½ Premier)	56.0

CLASS III.—Senior Touring Singles and Twins.

1.	F. W. Barnes (2¾ Zenith)	49 0
2.	J Cocker (2½ Singer)	50.3
3.	E. Kickham (2¾ Douglas)	56.6

CLASS IV.—Fixed Gear Touring Singles.

1.	J. Cocker (2½ Singer)	54.6
2.	V Taylor (3½ Rudge)	63.1
3.	J. Slaughter (3½ L.M.C.)	65.0

CLASS V.—Ladies.

1.	Mrs. Simpson (3½ Rudge)	90.8
2.	Mrs. P. Grout (2¾ Douglas)	94.9
3.	Mrs. Gibb (2¾ Douglas)	118

CLASS VII.—Passenger.

1.	F. P. Davies (3½ Rudge and sc.)	61.7
2.	H. G. Dixon (3½ New Hudson and sc.) ...	64.8
3.	F. W. Barnes (6 Zenith and sc.)	71.0

CLASS X.—Club.

1.	P. Phillips (2¾ Douglas)	60.5
2.	E. Kickham (2¾ Douglas)	60.6
3.	W. W. Douglas (2¾ Douglas)	62.3

CLASSES VI., VIII., and IX. were decided on time alone.

CLUB NEWS.

Streatham and District M.C.C.

A members' hill-climb will take place on the 27th inst. There will be the usual classes with weight limits.

Nottingham and District M.C.C.

Forthcoming events are as follows: May 4th, club hill-climb (handicap); 5th, club run to Skegness; June 1st, open speed trials.

Newport M.C.C.

The opening run and speed-judging competition took place on the 5th inst. Results: 1, H. Smith, 57 secs. slow; 2, A. Axelson, 94 secs. fast; 3, G. Mitchell; 4, O. Harris; 5, F. G. Purnell.

The Brookdale Club, Catford (Motor Section).

A reliability trial was held on Easter Monday, and resulted: 1, H. A. Cooper (Bradbury), 100; 2, F. G. Kennard (Matchless), 97; 3, J. Southgate (Matchless), 95.

Portsmouth and District M.C.

At a meeting held at the King's Hotel, Albert Road, on the 15th inst., the following were elected: Mr. Frank Tappenden, captain; Mr. A. E. Potter, vice-captain; Mr. F. Tappenden, 19, Albert Road, Southsea, hon. secretary.

Coventry and Warwickshire M.C.

On the occasion of his marriage to Miss Margaret C. Butt, which took place on Tuesday last, Mr Geoffrey Smith, the hon secretary of the club, was the recipient of a handsome present and letter of congratulation from the members.

Herefordshire M.C.C.

A good muster attended the opening run, on the 5th inst., through Abergavenny to Llangorse (lunch). The afternoon was spent by the Lakes, and the road taken again to Hay (tea), followed by a splendid finishing run into Hereford. A new handle-bar badge is in progress.

Birmingham M.C.C.

This club held its third annual "all equal" hill-climb on a steep hill having a right angled turn at the foot and a very rough surface, near Alvechurch, last Saturday. Each competitor had to ride the same machine, which was an old crock of unknown make, date, or h.p. Results: 1, L. Newey; 2, V. Busby; 3, K. Holden. See page 468.

Western District M.C. (London).

The reliability trial for the N.S.U. gold medal was run off on the 21st inst., and, subject to confirmation by the committee, the results are:

1, E. S. Ritter (2¾ Douglas), 1.5 secs. slow, takes gold medal; 2, W. F. Ritchie (5 N.S.U.), 22 secs. fast, receives a certificate; no other competitors made non-stop runs.

Merionethshire M.C.C.

At a meeting held at Bala on the 17th inst., the following officials were elected: President, Dr. E. Williams, Bala; vice-president, Captain Allan Jones, Penrhyndeudraeth; treasurer, Mr. A. Williams, Bala; secretary, Mr. B. Edwards, "Talrafon," Dolgelly. It is the club's intention to affiliate with the A.C.U. The number of members is increasing rapidly. A club run will take place on May 16th.

Pontefract M.C.

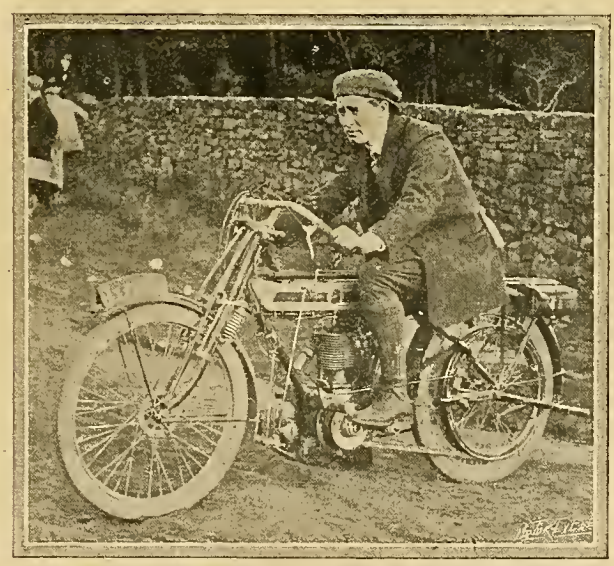
There will be a speed trial in Byram Park for the Carnes Trophy on May 16th, and a hill-climb for the Robson Cup on June 13th.

Aberdeen and District M.C.C.

The club held its opening run on Saturday, the 6th inst. The destination was Stonehaven, *viâ* the Slug Road. About forty-five members turned out.

Merthyr M.C.

A meeting was held at the Castle Hotel, Merthyr, on the 3rd inst., which resulted in a club being formed. It was proposed, and adopted, that the club be affiliated to the A.C.U.



North Middlesex M.C.C.

The London to Stratford-on-Avon and back run for the Premier Challenge Trophy will take place on May 5th. The run will be over a course of about 200 miles, starting and finishing at the Gate House, Highgate.

Chester and District M.C.

There was a run to Congleton on Easter Monday and an impromptu hill-climb on Allgreave Hill, near Buxton. Lord Tollemache has accepted the presidency of the club. The hon. sec., Mr. A. H. Catlow, 89, Brook Street, Chester, will be glad to hear from prospective members.

Results: 1, H. Fox (3½ Rudge Multi); 2, R. R. Thomson (3½ Corah); 3, W. Leather (3½ Bradbury) and A. H. Catlow (3½ Rover).

C. W. Smut, of Darlington, with his 3½ h.p. Smith-Precision, on which he competed in the Middlesbrough and District hill-climb at Castleton. He made fastest time of the day in the open class for any machine, and secured first place on time in the class for touring single cylinders.

Club News.—

Purley and District M.C.C.

Saturday's team trial for Mr. S. F. Edge's silver cup was won by C. W. Meredith (6 h.p. Zenith) and H. B. Willoughby (2¾ h.p. Humber). Third place was taken by R. W. Gaskins (Rudge) and V. Tomkins (Rover). The course was a stiff one of ninety miles, and included Brasted and Titsey, which had to be climbed three times each on the run.

Pontefract M.C.

A speed-judging competition was held on Wednesday, April 17th, over a secret course of 28 miles. The winner was Herbert Holmes (Triumph and sidecar), 19 m.p.h., who was 5m. 50s. fast. H. R. Haigh (3½ Rover), 19½ m.p.h., was second, being 6m. 9s. fast.

Wolverhampton M.C.C.

A reliability trial for motor cycles and passenger machines will be held on April 27th and 28th, for the Stevens Challenge Cup. The start will be made at 1.30 p.m. from St. Mark's Church, Chapel Ash. The route will be secret. This will be given out at headquarters on Friday, April 26th. The judges have power to disqualify noisy machines.

Hamilton and District M.C.C.

The club held its opening run to Moffat on the 17th inst., where it held a slow speed competition. D. Cameron (Triumph) and J. Ross (Roc) being successful. The officials are as follows: President, Mr. R. Cassells: captain, Mr. W. Dick; treasurer, Mr. W. H. Rodger; hon. secretary, Mr. J. Low, Carmaben, Hamilton.

Mersey M.C.

The committee of this club would gladly welcome the assistance of any gentlemen who would act as marshals, etc., on the route of the open twenty-four hours' reliability trial. The trial starts on Friday, May 3rd, at 8 p.m., from Liverpool, and finishes on Saturday, May 4th, about 8 p.m. Anyone willing to assist should write to Mr. S. W. Carty, hon. secretary, 5, Redcross Street, Liverpool.

Bishop Auckland, Darlington, and District M.C.

The club held a reliability trial to Whitby and back along the coast route on the 5th inst. The results were: 1, C. W. Smith (Zenith), lost 0 marks, winner of Palmer cord tyre and tube; 2, J. P. Forster (T.T. Rudge), lost 4 marks; 3, A. B. Hare (T.T. Triumph), lost 7 marks. In spite of the severe route along the coast and the strong head-wind, no failures occurred on the observed hills.

Kingston-on-Thames and District M.C.C.

Runs have been held to Brighton and Oxford. The membership now numbers upwards of 40.

Westmorland M.C.C.

Reliability run, held April 21st, from Kendal to Ulverston, Millom, Whitehaven, and finish at Keswick: 1, B. Jefferys (3½ Triumph); 2, S. W. Phillpott (2¾ Humber); 3, W. B. Little (3½ Rudge) and G. Hogg (3½ Triumph). Bronze medals: E. Jefferys (5 Indian), L. Haygarth (3½ Bradbury), and L. Pierce (3½ Premier).

Ipswich and District M.C.C.

The first reliability trial was held on the 5th inst. over a course of 98 miles, the route being Ipswich, Yarmouth, Norwich, Scole. Some twenty members took part and arrived well up to schedule time at the controls. Results as follows: 1, C. Bristo (2¼ h.p. Enfield); 2, V. Brown and K. Portway (T.T. Triumphs).

Aberdeen and District M.C.C.

This club held its first competition of the season at Cairn o' Mount on Saturday last. The climb was only over the short stretch at the Bridge of Dye, which is, however, the stiffest bit of the whole ascent, while the road surface, though not bad for Cairn o' Mount, left much to be desired. The winners were: 1, J. A. Wood, jun. (3½ Rudge), .041; 2, H. C. Matthew (3½ T.T. Triumph), .026; 3, J. Forrest (3½ Rudge), .025; 4, J. Corbie (3½ Rudge), .024.

Essex M.C.

During the Easter tour the famous Porlock Hill was visited, several attempts were made, but the 8 h.p. Rex-Jap was the only sidecar to make the ascent with passenger. G. E. Revill had hard luck in damaging his Zenith gear, but he detached his sidecar and then made an astounding ascent. A circular run home was made on Monday.

Burnley A.C.

A hill-climb will take place at Crown Point on May 4th. There will be the following classes:

1. Lightweights.—For machines with engines not exceeding 400 c.c. capacity.
2. For machines with engines between 400 and 600 c.c.
3. Open Class.—For machines up to 500 c.c. capacity.
4. Unlimited Class.—Open.
5. Sidecar Combination.—Run on handicap.

The machines must be standard touring motor cycles, and similar in detail to those usually sold to the public.

OFFICERS AND COMMITTEE OF THE TAUNTON AND DISTRICT M.C.C.

(Left to right).—W. J. Spiller, 3½ Triumph. G. F. Arnold, Motosacoche. W. J. Goodman, 2¼ Douglas (sub-capt.) T. G. Crump, 3½ Ariel tricycle (capt.) W. G. Potter, 3½ P. & M. (hon. sec.) A. J. H. Iles, 2¾ Enfield. W. H. Lock, 3½ Rex (hon. treas.)

Club News,—

Redditch and District M.C.C.

Eighteen entries were received for a hill-climbing competition on one of the Cotswold Hills. In the novices class, George White (Douglas), 69 marks, and Ernest Davies (Humber), 66 marks, were first and second respectively. In the private owners' class, K. Holden, 67 marks, was first, and L. Sealey, 66 marks, second, both riding B.S.A. machines. George White was again first in the open class (any machine) with 72 marks, and K. Holden second with 66 marks. The results were worked out on the A.C.U. formula.

The next competition takes the form of a speed-judging contest, between Droitwich and Kidderminster on the 27th inst.

Doncaster and District M.C.C.

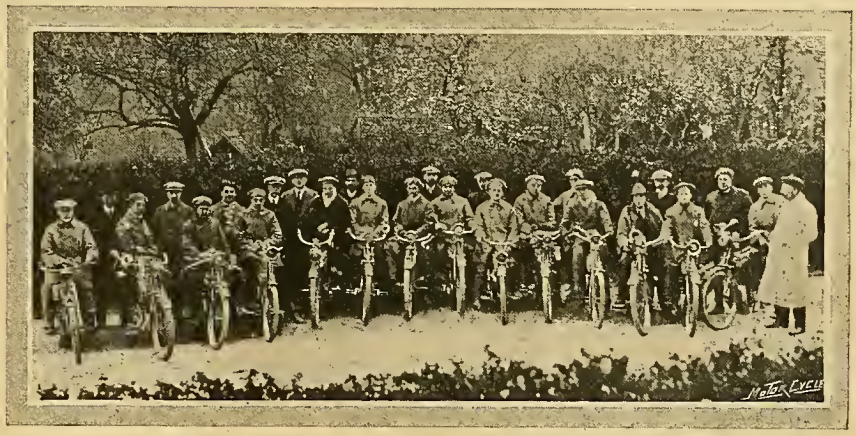
The results of the opening run, which took the form of a speed-judging competition to Wetherby, Yorks., a distance of thirty-two miles, are given below: 1, C. Barnsdale (3½ h.p. Rex), total error 4m.; 2, E. Goult (3½ h.p. Rudge), 5m.; 2, J. Wilkinson (5-6 h.p. Matchless and sidecar), 5m.; 4, T. Dew (3½ h.p. Triumph), 5½m. Four prizes are given, and Messrs. E. Goult and J. Wilkinson tie for second prize.

Motor Cycle Union of Ireland (Ulster Centre).

Under the auspices of the M.C.U.I. (U.C.) a most successful and interesting hill-climbing competition was held on Saturday, April 13th, on the mountain road, Derriaghy. The hill measures a little less than 1,000 yards, with one very sharp turn, and a gradient at places about 1 in 4. The surface was in very good condition, and the atmospheric conditions almost perfect.

In the private owners' class the result was:

		Time.
1.	W. F. Adams (3½ B.S.A. T.T.)	50⅘s.
2.	J. Bailie (3½ B.S.A. T.T.)	52⅖s.
3.	J. Martin (3½ Triumph)	57⅖s.



In the open class the handicap brought about a very close result for first place. W. F. Adams (3½ h.p. B.S.A.) and S. P. Corry (3½ h.p. Matchless) tied, but in the run off the former won. Result:

		Time.
1.	W. F. Adams (3½ B.S.A. T.T.)	50⅖s.
2.	S. P. Corry (3½ Matchless)	51⅖s.
3.	J. Stewart (2¾ Douglas)	51⅘s.

The following open events will take place during the season: May 4th, speed trials at Magilligan; June 1st, reliability run, Dublin *v.* Belfast; July 15th, Irish end-to-end reliability run; August 10th, hill-climb.

Wishaw and District M.C.C.

This club, the latest addition to Scottish motor clubs, has already a membership of forty. A hill-climb has been arranged for Saturday, May 11th.

Group of competitors and officials in the Redditch and District M.C.C. hill-climb.

South Birmingham M.C.C.

The members' hill-climb will be held on the 27th inst., by permission, on Wenlock Edge. There will be three classes—lightweights to 350 c.c., heavyweights to 500 c.c., and passenger machines of any capacity—and all events will be decided on A.C.U. formula.

Derbyshire and North Stafford A.C. (Motor Cycle Section).

The Uttoxeter Challenge Cup Competition took place on Saturday, the 13th inst., under most favourable conditions, the weather being grand and the roads in perfect order. The course—Allestree, Duffield, Belper, Shottle, Weston, Kedleston, Allestree—was an excellent one for such a trial, and had to be covered four times, making a total distance of eighty miles. Several stiff hills were encountered.

The competition attracted nineteen entries, including Miss Lottie Berend (2¾ h.p. Enfield) and Miss Walmsley (3½ h.p. Brough and sidecar). The latter, unfortunately, was put out of the running with valve troubles, and Miss Berend, who had made a fine first circuit, generously stopped to help her, and so gave up her place in the competition.

The club has now greatly increased in membership, and has established a ladies' section.

Result (highest possible marks, 200):

1.	M. Nicholson (8 Bat)	186 marks
2.	G. R. Bunnell (3½ Bradbury) ...	185 ,,
3.	J. Birchenough (3½ Rudge) ...	184 ,,

The Llanelly and District Motor Cycle Club is of recent formation, and has already a membership of seventy.

Questions & Replies

A selection of questions of general interest received from readers and our replies thereto. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference Letters containing legal queries should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Leicester to Talybont-on-Usk.

Will you be so good as to direct me the best way and approximate distance to Talybont-on-Usk, Wales? My machine is a 1910 Triumph.—C.D.E.B.

Your best route would be as follows: Leicester, Lutterworth, Rugby, Warwick, Stratford-on-Avon Bidford, Evesham, Tewkesbury, Ledbury, Hereford, Whitney, Three Cocks, Brecon to Talybont. The distance would be approximately 130 miles.

Hill-climbing Formulæ.

On page No. 355 of *The Motor Cycle* I note you refer to a formula which you recommended last autumn, and used by the Canterbury Club in its recent hill-climb I cannot at the moment turn up the issue in which you published particulars of this formula, and should be much obliged if you would send me details of it. At the same time, please give me particulars of the latest A.C.U. formula so that I can compare them. In a hill-climb which I shall be arranging shortly I want to include a class for both passenger and "solus" machines. The former will be for sidecars exclusively, and I should like to know if you can suggest a formula which would do for this class and give satisfactory results. When replying can you give me the name and address of the district surveyor for that part of Oxfordshire which lies just north of Panghourne and Whitchurch, as I wish to write him to ascertain one or two gradients of hills in that district?—R.G.B

The formulæ you refer to are in our issue for September 21st, 1911, pages 976-977; further notes appear on October 5th, pages 1028-1029. The formulæ are as follows:

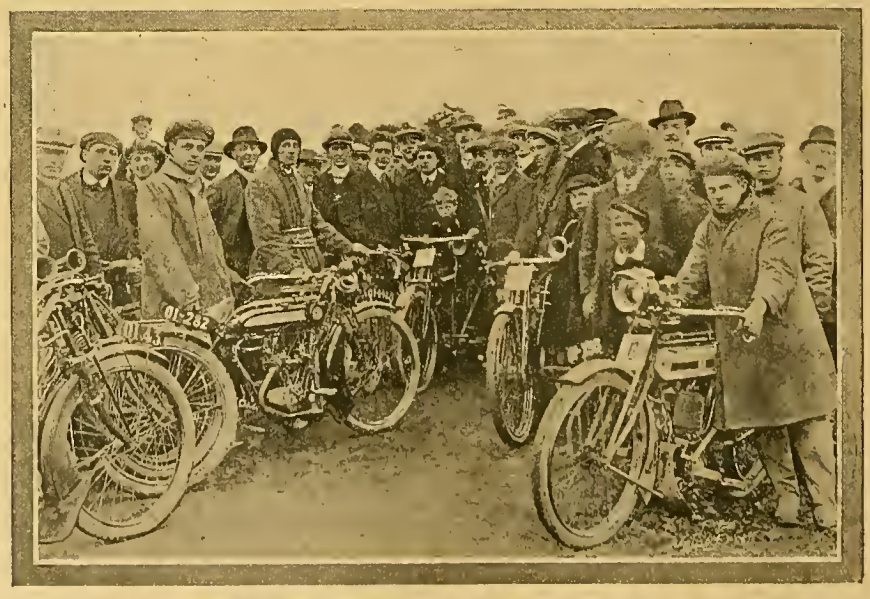
$\frac{D^2 \times S \times t^2}{W}$ for singles,

$\frac{D^2 \times S \times N \times .9 \times t^2}{W}$ for multi-cylinders.

If you have our capacity table the formulæ can be more simply expressed, $\frac{C \times t^2}{W}$ and $\frac{C \times N \times .9 \times t^2}{W}$. The smallest figure of merit wins. The A.C.U. formula is $\frac{C \times t}{W}$

By the last formula, if the size of the engine be doubled the speed must be doubled to give the same figure, which is impossible. Our suggested formulæ can be used for solus and sidecar machines. Write to the County Surveyor's Office, Oxford.

Overheating.



I am a member of the large number of keenly interested motor cyclists with small pockets and, therefore, second-hand machines. I have a 3½ h.p. '07 or '08 Rex, and this machine, though reliable, gets red hot on the cylinder top over the exhaust valve after about ten miles riding at about eighteen to twenty miles per hour. Can you help me by suggesting a remedy? I have watched your questions and replies column for some time, but have seen nothing like this mentioned there. I have had the cylinder head off and thoroughly cleaned it of deposit. I drive with as much air as the machine will take, spark almost fully advanced (magneto), and give half a pump of oil every four or five miles. The machine does not stop running when it gets red hot. I have fitted new piston rings and exhaust valve, but there is, as yet, no improvement. The timing I haven't dared to interfere with yet, but it is as I got it from an agent who has a fairly good reputation. The carburetter is a 1910 B. and B.—A.E.H.

The machine possibly wants thoroughly cleaning out, but the most probable cause is that the magneto wants re-timing and that the spark is occurring too late; this would have the effect you mention.

On the Choice of a Machine.

I am a cyclist of twenty years' experience, and no experience of motor cycling. I propose to purchase a second-hand motor cycle and sidecar for self (12st.) and wife (9st.), and am prepared to spend up to £40. I shall be grateful if you will help me by answering the following questions: (1.) Which makes do you advise me to look out for? (2.) Of what horse-power? (3.) Should I expect a two or three-speed, free engine, and sidecar for the figure named? (4.) Single or twin cylinder? (5.) Would you advise purchasing the motor first, learning to drive, and then fitting a new sidecar? —H.J.S.

(1.) It is against our rules to recommend any particular make. (2.) We should recommend not less than 3½ horse-power. (3.) You should have a change speed gear of some kind, and you might possibly get a machine thus equipped for the money named. (4.) For this price, it would be a single cylinder. (5.) Yes.

M.C.U.I. (Ulster Centre) hill-climbing competition at Derriaghy. Competitors at the start. The winner (No. 7) W. F. Adams is seen in the centre with his 3½ h.p. B.S.A. (See Club News pages.)

Norwich to Hay (Brecknockshire).

Will you oblige by giving me the best route for motor cycle and sidecar from Norwich to Hay, Brecknockshire, together with some idea of the distance? —G.H.B.

Your best route would be as follows: Norwich, Thetford, Newmarket, Cambridge, St. Neots, Bedford, Newport Pagnell, Buckingham, Aynho, Deddington, Chipping Norton, Stow-on-the-Wold, Tewkesbury, Ledbury, Hereford, Willersley to Hay. The distance is approximately 255 miles.

Sidecar Licence.

I should be glad of your opinion regarding the question of licence duty on a sidecar. The revenue authorities here (Edinburgh) hold that a motor bicycle with a sidecar is liable to two duties—one of £1 for motor cycle, and one of 15s. for sidecar being a carriage. The contention is that the sidecar is a carriage within the meaning of the Customs and Inland Revenue Act, 1888, which says that the expression "carriage" means and includes any carriage drawn or propelled upon a road by steam or electricity, or by any other mechanical power. The reason given for not including the sidecar in the duty of £1 for the motor cycle is that in the Finance (1909-10) Act, 1910, which imposes the duty, is a clause which says that the expression "motor car" includes a motor bicycle and a motor tricycle, but does not include a vehicle drawn by a motor car. As the matter is one of considerable importance to myself and to your readers, I would be glad to learn if the question has been raised before, and, if so, with what result?—LEITH.

Scotland holds definitely that a sidecar and motor bicycle are one vehicle. Let your local authority hold what it likes—refuse to pay more than £1 for a three wheeled vehicle. If you receive a summons, or are threatened with prosecution, immediately report the matter to the secretary of the Auto Cycle Union (Legal Department), 89, Pall Mall, S.W., and your case will probably be taken up free of charge.

Variable Gears.

Will you please let me know—(1.) Which is the best machine for sidecar work—3½ h.p. Premier or 3½ h.p. Macbeth-Precision, either with the Armstrong three-speed gear and F.E. clutch? (2.) Can the machine be started from rest from the saddle with the back wheel on the ground, or do I have to push off? (3.) Can the gear be changed without disengaging the clutch whilst running? (4.) Is the Albion two-speed and free engine hub gear a good one? (5.) How much does it cost for driving licence and registration of a motor cycle? Is there any other expense? Is any further licence required for a sidecar? Will you please instruct me as to the best method to go about this?—C.A.H.

(1.) Both machines are first class, (2.) A machine fitted with the Armstrong hub does not allow the engine to be started with the wheel on the ground. The machine can be put on the stand, engine started, and the wheel then placed on the ground, the clutch having been previously withdrawn, or you can push off. (3.) Yes; but it is desirable to declutch or raise the exhaust when changing up. (4.) The Albion two-speed is excellent. (5.) In addition to the driving licence and registration (5s. each) you must take out, at any post office, a local taxation licence (cost £1). No additional licence is required for a sidecar, but register the machine as a tricycle.

Starting away from the garage.

READER'S REPLY.

Melton Mowbray to Cromer.

I go to East Runton, near Cromer, every year for my summer holiday, and I always go by motor cycle *via* Saxby, Buckminster, Colsterworth, Corby, Bourne, Spalding, Holbeach, Long Sutton, and King's Lynn. From Lynn take the middle road to Fakenham *via* Roydon Station, Weasenham, and Toft-trees (the upper road *via* Hillington and Dunton was execrable last summer), and so on to Holt and Cromer. The road from summer. Your querist must be careful between Fakenham and Holt, especially if he arrives there towards dusk; there is a sharp right-angle turn to the left, followed immediately by a similar turn to the right just before you reach Holt. Last year at this corner an unfortunate motor cyclist with a brand new machine had a bad accident; he had gone straight ahead in the failing light at 35 m.p.h. into the hedge and bank, hoping to reach Holt by lighting-up time. E. PERCY SMYTH.

EXPERIENCES WANTED.

Readers desirous of obtaining the experiences of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries below should be addressed c/o The Editor.

"J.C.J." (Streatham).—2¾ h.p. or 3½ h.p. Wuduna-Arno.

"S.J.F." (Ainsdale).—Binks and Lukin carburetters.

"W.A.C." (Birmingham).—Rollo cyclecar or other make with four wheels.

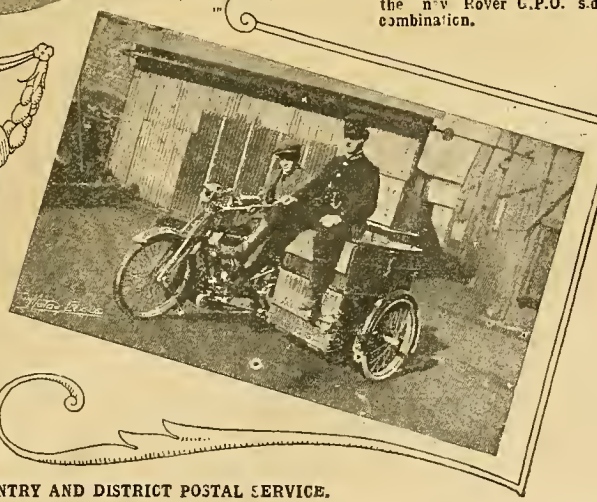
"R.T.M." (Smethwick) Mabon clutch with 5-6 h.p. motor cycle and sidecar.

"M.P.S." (Dublin).—Mabon clutch on 3½ h.p. Triumph with sidecar.

"J.K." (Huddersfield).—3½ h.p. Zenith-Gradua and Rudge Multi with sidecar.

"R.C." (Scarborough).—Lincoln-Elk, petrol consumption and hill-climbing.

"C.W.S.S." (Cheadle).—Mabon, Bowden, Albion, and Millennium gears on an old pattern 3½ h.p. Triumph with sidecar.



"H.R.W." (W. Norwood).—Villiers clutch.

"J.K.W." (Westcliff).—6 h.p. Zenith and 5 h.p. Clyno.

A tester initiates the postman in his new duties.

Teaching a postman to drive the new Rover G.P.O. sidecar combination.

THE MOTOR CYCLE IN THE COVENTRY AND DISTRICT POSTAL SERVICE.

A NOVEL SIGNPOST.

A fortnight ago we referred to the curious signpost erected at Mason's Hill, Bromley. We are now able to illustrate it.

Carburetters and Hill-climbs.

In three open hill-climbing competitions, viz., Oakamoor, Leathley Bank, and Brigsteer Brow, we are informed machines fitted with Amac carburetters won thirteen different classes besides several seconds and thirds.

Three-wheeled Cyclecars.

The makers of the Wall tricycle, A. W. Wall, Ltd., Hay Mills, Birmingham, are prepared to arrange trials of the standard two-seater either at the works or in London. The 1912 illustrated catalogue is also ready and will be forwarded on application.

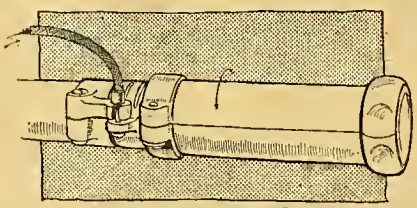
Tyre Successes.

Clincher motor cycle tyres scored a signal success at the Staxton Brow hill-climb in the class for standard touring singles, the three Norton machines which finished first, second, and third, being fitted with these tyres. The winner of the Tranmer Trophy, who also made fastest time of the day, used the same make of machine and tyres.

Neat Repair Outfit.

The Severn Rubber Co. have sent us a neat motor cycle repair outfit, which is contained in a metal box measuring 5in. × 4in. × 1½in. The solution is specially prepared for use with Severn patches, and is kept moist and in good order by being packed in a circular tin box provided with screw lid which cannot work loose. The outfit includes a good supply of Severn specially prepared patches of various sizes, oval and rectangular, glass paper, prepared canvas, chalk, valve rubber, etc. Experience with these patches and solution enables us to recommend them with every confidence, if the solution be well rubbed in and the tube properly cleaned before applying the patch; the repair will last practically indefinitely.

SPARKLETS



Easy Payment Systems.

Among the firms which make a speciality of supplying motor cycles on the easy payment plan are the Wincycle Trading Co., Ltd., 106, Great Saffron Hill, E.C. An illustration of their latest model was published on March 28th, page 358.

A New Twisting Grip.

The sketch herewith illustrates a new twisting grip designed and manufactured by Charles Binks, Ltd., mainly for racing purposes. The grip is made suitable for almost any handle-bar, and can be fitted in a few minutes. The two halves are placed over the bar, and held in position by a screw clamp. The halves can then be tightened by means of screws till the desired amount of friction be obtained. The grip is supplied well finished and plated. We hear

that racing experts pronounce the device excellent, as it is difficult and dangerous to release one's hold of the handle-bar to alter the usual type of control levers when travelling at high speeds.

The Jarrott Cup Winner.

Harold Karslake's 3½ h.p. Rover, which won the Jarrott Cup this year, was fitted with Bates new pattern tyres and Lyso belt. Karslake went through the trial without a puncture or a stop of any kind due to tyre trouble.

Catalogues Received.

The latest catalogue issued by G. Raws and Sons, Oldhall Street, Liverpool, gives particulars and illustrations of this firm's Albany clothing. The Albany All-season jacket is fitted with a detachable lining.

The special features of "The Duo," a four-wheeled runabout, made by Duo Cars, Ltd., are described in a well illustrated quarto catalogue just to hand. The offices and showrooms of this firm are at 76, York Street, Westminster.

The new catalogue of the Royal Enfield motor cycles is a most interesting pamphlet. Besides full specifications of the four models, it contains details and drawings of the Enfield two-speed gear, friction clutch, cush drive, lubrication methods, and other particulars that should be carefully studied by purchasers. There is also a sectional view of the 2¾ engine, and the catalogue, which can be obtained from the Enfield Cycle Co., Redditch, concludes with a list of some of the numerous successes.

A Farewell Gathering.

To bid farewell to Mr. A. Mellano, the popular manager of the Hutchinson Tyre Company, a dinner was given at Guermani's Restaurant, Dean Street, on the evening of the 18th inst. Mr. Mellano, whose arrival was greeted with great enthusiasm, is about to leave England to take up the management of the Italian business of the company. The gathering was an informal one, and throughout the evening demonstrations were given of the affection with which the firm regard Mr. Mellano. Mr. E. M. P. Boileau was present on behalf of *The Motor Cycle*.

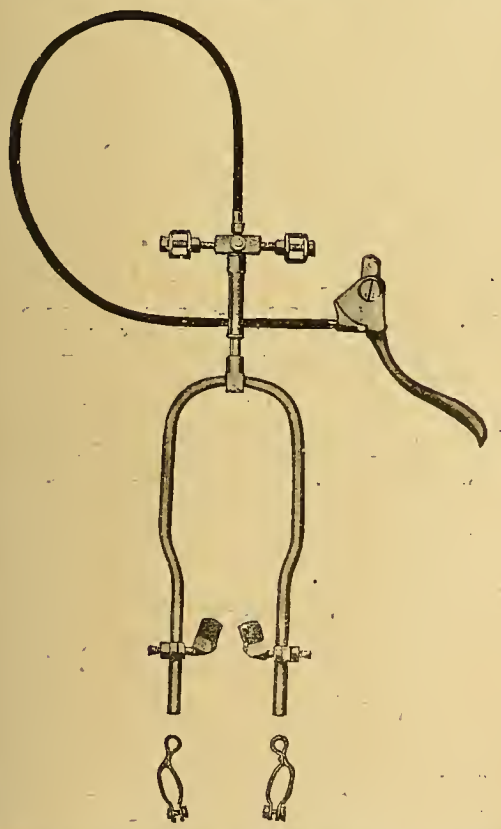
The photograph depicts what is undoubtedly the first cyclecar wedding. It was taken on the occasion of the marriage of the Rollo Car Co.'s works manager at Christ Church, Sparkhill, Birmingham. After the ceremony the happy pair left for a tour in North Wales.

—The simplest, most adaptable, and safest method of control over the working parts of your bicycle is best attained unquestionably by

"BOWDEN-CONTROL"

—i.e., the adoption of the Bowden Brake Co.'s Brakes and various Bowden-mechanism Controls operated from the handle-bar, etc.

—Have the efficient management of your machine completely at your finger ends by using Bowden Fittments!—and see these appliances bear our mark.



—Write for our interesting Illustrated Booklet of "Bowden-control" productions.

BE YOUR OWN EXPERT.

Are you quite sure that that car you are thinking of buying is all that its owner represents it to be?

In these matters a practical knowledge of the working parts of a car is indispensable.

This can only be obtained by a thorough course of tuition such as that provided by—

THE INTERNATIONAL SCHOOL OF MOTORING,
PYKE HOUSE 19, Oxford Street, W.
(opposite Oxford Music Hall).

Call, write, or 'phone, for free illustrated prospectus.

We offer special terms to Motor Cyclists for private tuition.

YOUR OWN ADVICE IS BEST.

—IN—
"THE MOTOR CYCLE"
will soon find a customer for your second-hand machine.

SECOND-HAND MOTOR CYCLES

at from 2/- to 5/- in the £ discount!

This means that we are going to move the stuff! If you have not had a list you OUGHT to have had one. Get on the jump and let us have that postcard, and we will send you one straight away. Look through the list; spot a machine to suit you; make us a cash offer, or deferred payment offer, and be handy about it; and you will have a machine through in about three days. The coal war is now settled for the time being, and everyone is more or less pleased with themselves, so that it is time you got a bike. You will find it come in handy in view of a possible railway strike. However, we have got used to strikes now, and it is no use worrying about the matter. Get a motor cycle, and thus have a means of locomotion of your own at hand, and you are then independent of everything in this respect.

We are not advertising for amusement! Please note! We INTEND TO SELL. If you won't buy at our price, let us have your offer, and we will try and sell at your price. The makers are deluging us with new stuff every week, and we do not know where to put it. We have been telling you this tale for a month, and although the second-hand machines are going fairly satisfactorily, we want them to go quicker. Remember twenty or thirty new machines are coming in every week, and these take up room. We have also several cars coming through, and these will take up more room still, so that between the lot we want your assistance to shift the second-hand stuff. If you have not enough money, let us know how much you have, and we will get on the jump and try and sell you a machine. If you will be quick we will be able to sell you a machine as quick as a packet of Woodbines. You cannot go wrong with us. If you can come down, we will show you the stock, and let you try a machine on the road; this will be far better than sending you one. The railway companies are now running excursions, we believe, and if you cannot get one of these, you can always get a cheap ticket, or it will pay you to come by the ordinary train. If you cannot possibly come over, send for a list, and spot a machine, and we will send same along to you. If it is not as per specification, **you can return within three days, and have your money back in full;** or we are pleased to exchange at any time for another machine.

We are offering you all sorts of tempting terms, and we want your trade. Don't wait while the summer comes. Get on the jump now! There is no time like the present!

We can suit every man, even down to the man with only 50/- in his pocket. You can become the owner of any accumulator machine in our garage for £7 10s. cash down. If this is too much for you, you can have one for £4 19s. 6d.; and if you cannot spring this far, have another packet, and have one for 50/-. These are machines that will run, not something to look at. The prices are ridiculous, but the quality is good, and we intend to shift them. If your fancy lies in the direction of a magneto machine, you can have one from £12 10s. upwards. There is no price too low for us, nor yet is there any too high. We can fit you up with a new or second-hand Matchless, Jap-Bat, Clyno, Scott, P. & M., Bradbury, Zenith, Motosacoche, Humber, Douglas, Premier, Morgan Runabout, A.C. Trica, and heaps of other machines, which you can pay for on cash or deferred terms. We will guarantee our stock to be the largest in the world. We are not out to tell you a tale and drop you in. All we ask you is if you have not seen our stock to come across someone who has seen it, and see what they have to say about it. Many firms advertise whose stock is not one-twentieth as large as ours, and yet on paper they make quite as good a show as we do. You don't know what our stock is like without seeing our list. We cannot afford to publish it in the paper and tell you the tale besides.

We have no interest in any other firm in the kingdom, therefore don't mix us up with others. When you are finished with our list, pass it on to your pal, so that it becomes a rolling stone.

If you don't know where Morecambe is, we will tell you. It is three miles from Lancaster, the capital town of Lancashire. If you live in Ireland, you can come across by boat to Heysham, which is three miles from Morecambe. The roads around here are excellent—the finest in the kingdom. You can come by train, and ride the motor cycle back.

There are one or two things that we want to tell you this week. (1.) We cannot let motor cycles go and accept payment by cheque from strangers. (2.) If you run into a wall with a motor cycle, we cannot guarantee to repair it for nothing. (3.) We cannot send a mechanic down to, say, Wolverhampton to show you a motor cycle, as our men are too busy at home for anything of the kind. If you will come up here, however, we will show you what we have, and let you try one on the road, and we can guarantee to give you satisfaction. (4.) We can supply you with a great deal better value than anybody else, but we cannot supply the impossible, such as, for instance, a 1911 P. & M. or F.E. Triumph for £25. We can do a lot, but our reply to an enquiry of this sort would, we fear, be of a kind that would be anything but pleasing to you. We are not out to act the goat for anybody, although if you said such an enquiry was in the nature of a joke, we might be able to appreciate it.

Another thing, boys, we don't open on Sundays. By Saturday night we have had quite enough of it, and if we cannot make sufficient money in six days we will not take the trouble to try and do so on the seventh. Remember, we put in twelve or thirteen hours every day of the six in the week; and if any of you do the same, we are sure you will not feel inclined to work on the seventh any more than we do.

We have still any amount of accessories to shift, both new and second-hand. The stock seems enormous, and we want you to help us to get rid of it. You cannot do better than make up your minds to have a week-end at Morecambe. You can then get a machine, new or second-hand, and buy all the accessories you want while you are in Morecambe. We have told you before that we are agents for all the very tip-top stuff, and the fact that such people as P. & M., Matchless, Scotts, Clyno, Bradbury, Humber, and Jap-Bat, and all the rest of the makers consider us sufficiently good business people as to accept our orders for thousands of pounds worth of machines should make it quite clear to you that we are a firm of sufficient standing to justify your placing your orders with us.

Till next week, boys, good-bye!

Hitchen's, Ltd., Morecambe.

Telephone: 112. Wires: "Motor, Morecambe."

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words or less 1/6, and 1d. per word after. Each paragraph is charged separately. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor Street, E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should state distinctly under what heading and in what issue the announcement appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

CLASSIFICATION BY LOCALITY.

For the convenience of purchasers of second-hand motor cycles, the advertisements are classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Plan showing division of England into Sections

SECTION I.
Northumberland, Cumberland, Durham, and Westmoreland.
SECTION II.

9, SHOE LANE, FLEET STREET, LONDON, E.C.

Wires: Opificer, London. 'Phone: Holborn 5777.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each by post.

MOTOR BICYCLES FOR SALE.

The REX-J.A.P.

in the hands of

A PRIVATE OWNER.

"98, Marchmont Road,
"Edinburgh, March 25, 1912.

"Dear Sirs,—I feel it is only right that I should let you know how absolutely satisfactory my 6 h.p. REX-J.A.P. is proving.

"Since taking up Motor Cycling I have been in the habit of using a 3½ h.p. with Sidecar, and while some makes proved themselves able to occasionally take us up hills on the low gear, others were decidedly opposite, and it was generally a case of running alongside or shedding the passenger.

"My REX-J.A.P. is geared 3¾ to 1 on top, and I have never (as yet) required to put her into low gear on any hill we have come to. A slight touch of the throttle, and away she goes, devouring the ground like a 90 h.p. car.

"On Saturday, with a lady passenger of 10 stones, and myself of 10 stones 9 lbs., she registered by Jones Speedometer 53 miles per hour, and she wasn't 'all out,' so goodness knows what speed she will attain when ridden solo.

"I am going in for a lot of Sidecar competitions, and feel very confident of several successes. With all good wishes to you.

"I am, Yours faithfully,
"(Signed)
"FRED. J. HUTCHISON."

We shall be pleased to post you Catalogue upon request.

This Year's T.T. Races.

THE regulations for this year's T.T. Races have been passed by the Auto Cycle Union, and nothing now remains except to secure a large entry and a sufficiency of funds to ensure good races taking place. The rules are practically the same as for the 1911 events, with the one very important alteration regarding cubical capacity of the cylinders. Last year multi-cylinder engines were allowed 85 cubic centimetres greater capacity in the Senior race and 40 cubic centimetres extra in the Junior race. This year single and multi-cylinders will compete on level terms for the first time in the history of the race, and all engines, no matter of what type, must be within the same limits, viz., Senior race 500 c.c., Junior race 350 c.c. Thus the Senior twins are brought down to the level of last year's singles, the Junior singles go up 50 cubic centimetres, and the Junior twins 10 centimetres. The most important alteration is in connection with the Junior singles, and some excellent results may be expected from a single-cylinder engine of, say, 76×77 mm. = 349 c.c., particularly if the machine be fitted with a change-speed gear.

British Motor Cycles in Canada.

ONE who is closely in touch with Canadian motor cycle matters, and who has also a knowledge of the British motor cycle trade, asks a pertinent question in a letter addressed to us when he says, What is the matter with British motor cycle manufacturers? This motor cyclist says that he is not speaking without his book when he assures us that at the end of this year the motor cycle market in Canada will be as completely in the hands of the United States as the motor car trade now is. Various reasons are given for this state of affairs, most unsatisfactory from a British point of view. We mention a few of them, and presume that British makers are so extremely busy now that they have neither time nor opportunity to devote to the Canadian market. However, the demand will not always be as brisk as it is at present, and our correspondent's views should, we think, be duly considered by all British makers.

It is alleged that American manufacturers give Canadian agents a considerable advantage in discount in comparison with their home traders, and that British makers will only allow the same terms as they do to home agents. Owing to the recent reduction in the price of all American machines, we are told that they are now being sold in the Dominion of Canada at a much lower price than English motor cycles. This in spite of the fact that the United States products pay duty at the rate of 35% *ad valorem* against the preferential rate of 22½% on British-made machines. In discussing the question with other British readers of *The Motor Cycle* in Canada our informant says it is noticeable that in the home market the English manufacturer is popularising his machine by entering it in almost every contest that is held, but when it comes to Canada it is not considered necessary to take steps to enter into competition with riders of American machines. It is said the United States manufacturer sends riders and machines to compete in all Canadian events, and although he is able to do this more conveniently than English makers, owing to the close proximity of the U.S. and Canada, it might be advisable for British makers to take heed of this

warning with regard to the way in which American manufacturers are popularising their mounts in the Dominion.

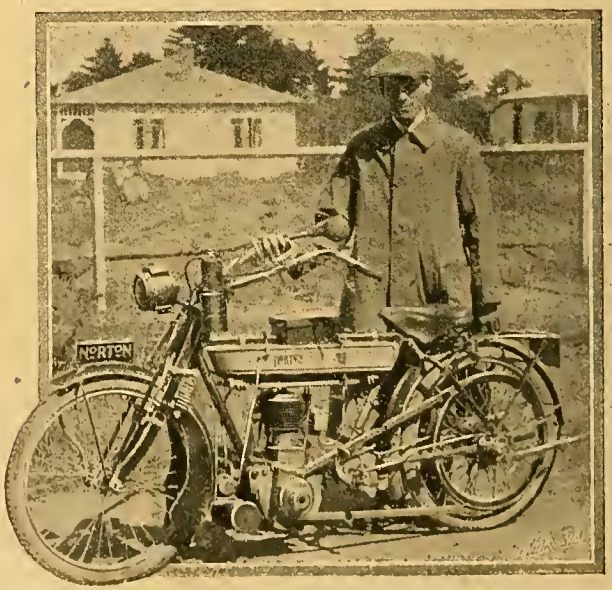
It is hardly practicable to send riders and machines from England to take part in these competitions, but it is perfectly easy to make arrangements with agents in Canada for British machines to be represented in these contests, and unless something of the kind be done we are told that the demand for British motor cycles in Canada within the next twelve months will be *nil*.

Here is another instance that the American manufacturer realises the possibilities of the Canadian market. A United States firm which is located across the border line is already making plans to build machines in Canada and so avoid all duty.

We feel certain that the sterling qualities of British motor cycles will always secure them a market abroad, but it is advisable to take heed of competitors who are only too ready to take advantage of what is often described as British lethargy. In our opinion our makers are far from lethargic, and the onimous warning given by our correspondent is due to the difference between American and British manufacturing methods. The American maker is inclined to be more speculative in production, and must find outlets for his surplus products. In consequence he is prepared to accept very much lower prices for exported machines than those sold at home, whereas the demand in England at present is so large that the majority of British makers have no necessity to make concessions. We do not wish to pose as alarmists, as we know that one or two of our makers have an excellent connection in our Overseas Dominions, but it is with a view to assisting them to retain it and helping others to gain a footing that we have penned the above article.

The Problem of the Automatic Carburetter.

THE air seems full of automatic carburetters, each one more economical, more flexible, and more powerful than its predecessors if the claims made on its behalf are to be believed. This, and



R. Holloway (Premier) taking one of the bends on Chew Hill in the Bristol M.C.C. Open Hill-climb. His cornering at high speed was much admired by the spectators.

the fact that the problem of the automatic carburetter has always been a very difficult one to tackle, renders the subject a very interesting one at the present time.

It will be as well to review the principle on which the modern motor cycle carburetter is designed. First we have the essential that the petrol (except in the case of one carburetter—the Senspray) must be exactly level with the top of the jet; then (again with one or two exceptions) we have the main air, the correct proportioning of which, through the medium of the choke tube, means a great deal to successful running; then we have the hand operated extra air to compensate for the extra suction on the jet at high engine speeds. Engine suction affects the flow of petrol and air in an inverse ratio, consequently some means have to be adopted to reduce the pressure on the jet at high engine speeds, and this is accomplished by means of the extra air. Contrary to general belief, on the extra air port being opened, no more air enters the cylinder; what happens is that the pressure in the inlet pipe being reduced, less petrol is drawn from the jet, consequently the mixture is weakened, and though this may appear to amount to the same thing at first sight, yet a little reflection will show that it is a very different result altogether. The problem is to design an automatic device that will invariably give the correct amount of air to ensure a perfect mixture under all running conditions—by no means an easy matter when we consider that there are no less than four items that require to be taken into consideration, namely:

1. Throttle position.
2. Engine speed.
3. Temperature.
4. Specific gravity of petrol.

I now propose to treat each item separately:

Laurence Pitcher (3½ h.p. Norton) who secured first place in the Reliability Trials held recently in New Zealand from Christchurch to Akaroa. Mr. Pitcher gained full marks and won the petrol consumption test.

The Problem of the Automatic Carburetter.—

Throttle Position.

This is what to all intents and purposes governs the air supply; it is quite a practical proposition to make a carburetter in which the air supply varies in unison with the amount of gas admitted, and, in fact, this was done as long ago as 1908, the Quadrant machine of that year being fitted with a carburetter of this type. The present day multi-jet carburetter works on this principle.

Engine Speed.

Though this only affects the extra air supply to a limited extent, yet we cannot afford to leave it out of consideration, as every motor cyclist knows how much more air the engine will take when going fast. The reason is, as I explained above, owing to the fact that the flow of petrol and air does not vary proportionately. It is quite possible to restrict the flow of petrol by mechanical means—witness the Dunlop carburetter, which made its appearance during the early days, which had a sort of fret saw blade in the jet, the idea being that this would act as a sort of check on the excess of petrol.

Temperature and Specific Gravity of Petrol.

We can bracket these together, as without doubt the best way of dealing with each would be to fit an adjustable air intake on the carburetter body, so that we could adjust the amount of air to suit the conditions day by day.

Let us see what there is to fill the bill in the motor cycle and car world. Though one would think that the most reasonable way to design a carburetter would be to arrange for the throttle piston to uncover extra air ports and for some automatic device to admit air in addition according to the engine speed, yet I do not remember a carburetter designed on these lines—they all seem to rely exclusively on one method or the other. The original Krebs (car) carburetter (which is the ancestor of all modern automatic carburetters) had a spring-controlled valve, which, operated upon by the engine suction, opened in accordance with the engine speed. A dash pot was fitted to prevent chattering. Up to a couple of years ago, practically all car carburetters worked on this principle, but of late there seems to be a tendency to give air strictly in accordance with the position of the throttle, regardless of engine speed.

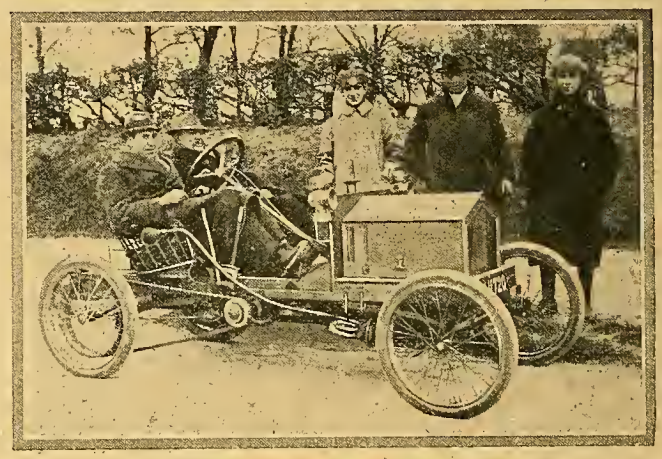
So it will be seen that there is nothing much to interest us in the car world, and moreover, as a motor cycle engine has to work between wider speed limits than a car engine, a principle proved in motor car engineering may not necessarily be the best one on which to design motor cycle carburetters.

Modern Automatic Carburetters.

At the present time we have a good many motor cycle carburetters of the automatic variety to choose from. First, there is the "Jap," which has a number of jets each with a separate air supply, and which are uncovered by the throttle sleeve, which has been before the public for a number of years, and the fact that it is used for racing shows that it must be efficient. This carburetter has an adjustable air intake which one sets to accord with the engine's "humour." Among others are the Stewart-Precision, Lukin, Binks two-jet, Claudel Hobson, and F.N., but I cannot help thinking that all the automatic carburetters I have mentioned (excepting the "Jap," which has the air adjustable) are open to criticism on the same ground as car carburetters, viz., the designers seem to take it for granted that the engine speed always varies with the position of the throttle. Obviously, it does not, and we want more air with the engine buzzing on half throttle on a level road than we do when the engine is pulling comparatively slowly uphill on the same amount of gas. These automatic carburetters, however, do not allow for this, consequently they must always be adjusted for certain conditions and for those alone.

Semi-automatic Types.

There is another type of carburetter, which I shall call the semi-automatic type. The Douglas, Indian, C.A.P., and old pattern Amac are examples of what I mean, and though they are fitted with air levers yet they are practically automatic, as air is admitted according to the position of the throttle, and the air lever need only be touched at the beginning of each ride. I regard this type of carburetter as a particularly meritorious one, and I am surprised that manufacturers have not taken the matter up with more enthusiasm.



Middlesbrough M.C.C. Hill-climb at Castleton Bank — Danby (7-8 h.p. Indian) taking the corner rather wide and a little too fast. He ran into the bank about twenty yards further on but was fortunately unhurt.

The Problem of the Automatic Carburetter.—

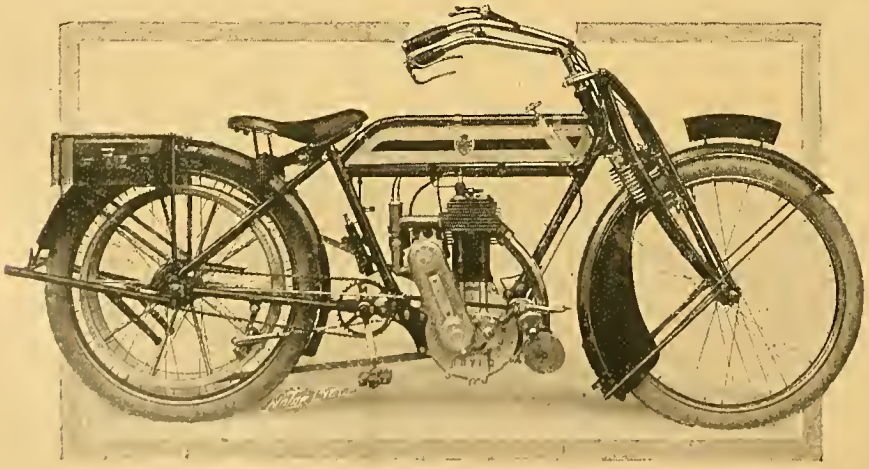
To deal with the claims made on behalf of the automatic carburetter as regards power and economy in fuel consumption, obviously the hand-controlled carburetter must be at least as powerful and at least as economical as any of the automatic type, as power and consumption are entirely dependent on the correctness or otherwise of the mixture supplied to the engine, and the present-day non-automatic carburetter provides, in my opinion, a mixture which cannot be improved upon by the best representatives of the one-lever variety. It is only in the case of an absolute novice that the automatic carburetter would be of any great benefit, and a man does not always remain a novice. [Some do.—ED.]

To sum up, though there is undoubtedly a demand for automatic carburetters, yet I do not think that they are in a sufficiently advanced state to merit their being fitted as standard, and certainly, owing to the exacting requirements of the motor cycle engine, I do not see how we can ever do without the extra air lever, which has proved itself to be an indispensable adjunct in the past. On how many occasions, for instance, has not the timely closing of the extra air cured an attack of "conkitis"? Does not every rider adjust and readjust the quality of the mixture, until he feels that the engine is doing its best? Come what may, automatic carburetters or not, I shall regard the extra lever as a valued friend. E.M.O.

ANOTHER NEW CYCLECAR.

The above cyclecar has been designed by N. Crane, of Nottingham and he has a so built it without any professional aid whatever. It is fitted with an 8 h.p. J.A.P. engine (fan-cooled) and Kingston carburetter, while the final drive is by means of Whitile belts on either side. A two-speed and reverse gear is provided.

A RUN ON A ROVER.



OWING to the kindness of Mr. J. K. Starley, a 3½ h.p. Rover fitted with the Armstrong three-speed hub was placed at our disposal for the re-run A.C.U. One Day Trial. On Tuesday afternoon last week we left Coventry for Oxford on a bright sunny day. The wind was just cool enough to make riding almost perfect. Soon after leaving Coventry we changed into the high gear (approximately 3½ to 1), and except for traffic we never had to change down. This is probably accounted for by the heavy flywheels, which also increase the smooth steady pull of the engine.

With the cut-out shut the machine is the quietest we have ridden, as there is not a sound from the valve gear. The Rover Co. seem to have discovered the way to make quiet valve gear without sacrificing the efficiency of their cams, and we should be glad to see some other firms make experiments in the same direction, for riding a Rover in traffic can be compared to driving a high class car. There is not a click to be heard.

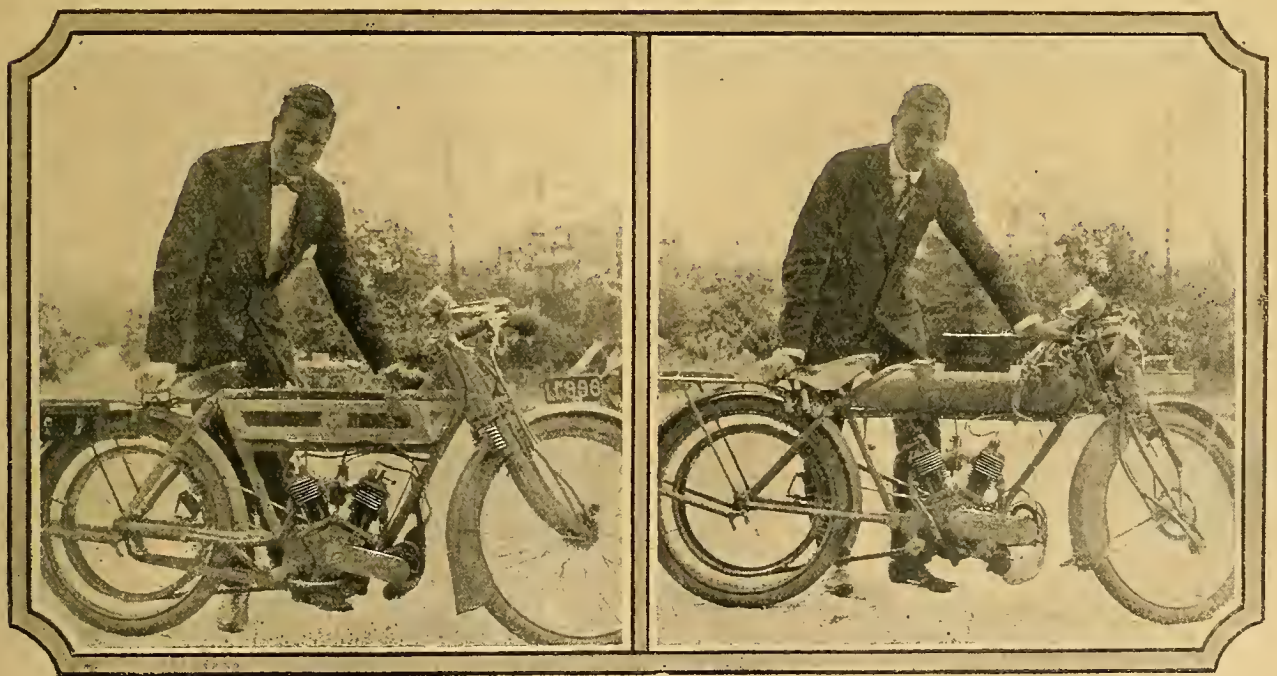
The day of the trials was perfect in every way, and though the dust was bad in places, generally speaking it was not so bad as might be expected. The Rover ran perfectly throughout, and took both Birdlip and Saintbury hills on the middle or direct gear. Uley Hill came as a surprise, and, owing to a bunch of competitors, we were unable to get up any pace, and so dropped to the low gear, on which we could play with the hill. Sunrising required the low gear for the last few yards, but this was only because we had been travelling fast so as to get ahead of the competitors and had thus warmed up the engine.

We are grateful to the Rover Co. both for the opportunity of a delightful run on such a fine machine and for the complete way in which the machine was equipped. The only adjustment made was the changing of a belt fastener link, so as to take up a slight amount of belt stretch.

On our return to the works we inspected a new model which is fitted with a dropped top tube and a tank with rounded top. This model has a particularly neat appearance, as will be seen from the accompanying illustration.

The new model 3½ h.p. Rover with dropped top tube and rounded top to tank.

A Hill-climbing Championship.



The A.C.U. might add a little extra interest to the year's open hill-climbs by starring certain open climbs as championship events, and awarding a championship cup in each class to the riders scoring the highest number of marks in the total of performances in these climbs during the summer. This would be a simple and practical method of getting into touch with riders living in distant corners of the provinces, and would also limit the number of climbs to which firms are practically compelled to send their trade riders.

The increasing number of open climbs bids fair to be a greater incubus to the trade than the old glut of one day reliability trials ever was. Further, the competition between club secretaries to get their climbs on to the championship card would tend to improve organisation, which is very often astoundingly faulty at certain provincial events billed as "open climbs."

Furthermore, the records thus necessitated would provide a register which might be utilised to secure genuine novice classes. It would open the way to novice classes, in which any rider who had ever competed in a championship class would be ineligible. Of course, the list of timekeepers allowed to officiate in a championship climb would have to be sternly supervised. Some of the country timing is childishly inefficient, and there are few hills on which it is safe to start two riders side by side. I hope the skilful driving tests of slow riding and restarting will be more utilised this year. A slow riding test with the men starting in pairs is great fun, and remains a novelty in many districts.

Gears for Sidecar Work.

Are variable gears of the hub type for sidecar work to become popular? If a hub gear fail to provide a lower ratio than 8 to 1, and if that be only obtainable when the engine pulley is screwed out to a diameter at which a belt is not at all likely to grip in wet weather or on a long hill, then I should prefer either a chain drive or a counter-shaft gear. 8 to 1 is a very satisfactory low gear for a chain-driven twin and sidecar, unless Honister is on the *tapis*. But 8 to 1 is not too joyous a ratio for a 3½ h.p. single and sidecar up Sunrising on a wet, windy day. If the engine remain happy, the belt may very probably prove a trifle morose. In my opinion the variable gear with the best future where a belt is used is that which affords a genuinely low gear in conjunction with a very big engine pulley.

SMALL TWIN ENGINES AND THEIR ENTHUSIASTIC RIDERS.

Both these machines—a Trump and a Matchless—are fitted with the J.A.P. 3½ h.p twin engine (60 mm. bore by 76 mm. stroke, cubic capacity 430 c.c.). The owners tell us that toe machines are capable of an average speed of 35 m.p.h. when geared 4¼ to 1, that they can do 54 m.p.h. on Brooklands track, and climb the test hill at 30 m.p.h. The riders, S. G. and J. C. Bain, have previously owned single-cylinder machines, but are so delighted with the little twins that they inform us they do not intend to ride any but multi-cylinder machines in the future.

Questions & Replies

A selection of questions of general interest received from readers and our replies thereto. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal queries should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Coventry to Cardiff.

I shall be obliged if you will tell me the shortest and best route from Coventry to Cardiff, avoiding big towns and tramlines.

Your route will be Coventry, Warwick, Stratford-on-Avon, Evesham, Tewkesbury, Gloucester, turn R down Westgate St., and take first turning to the left after crossing the second bridge over the Severn. Go through Newnham, Lydney, Chepstow, and Newport.

Brooklands.

(1.) What meeting is there on at Brooklands on Whit-Monday? (2.) Could you give me the route from here (Woodbridge) by road? I should prefer to avoid London. (3.) What does it cost for admission to Brooklands track as a spectator? (4.) Where can I see an advertisement with full particulars?—H.I.

(1.) There is a full motor car race meeting at Brooklands on Whit-Monday, in which there will probably be two motor cycle races. (2.) The route from Woodbridge would be as follows: Woodbridge, Colchester, Witham, Chelmsford, Billericay, Tilbury, Gravesend, Wrotham, Riverhead, Westerham, Redhill, Reigate, Dorking, Leatherhead, Cobham, then straight to Brooklands. This avoids all the London traffic. (3.) The entrance costs from 2s. 6d. on that day. (4.) Full particulars can be obtained from the Brooklands Automobile Racing Club, Carlton House, Regent Street, S.W.

One of the new Calcott lightweights photographed on Edge Hill. The makers, Calcott Bros., Ltd., Coventry, inform us that the tester had no difficulty in ascending the hill with a passenger on the carrier.

Mending the Float.

Recently my carburetter started flooding, owing to the float being punctured. I had this neatly soldered, and everything was right for about fifty miles. Now I can't run slower than 15 m.p.h., for with the throttle practically closed it requires air half open. I notice that when the engine is running it blows petrol out of the air holes in the chamber. I have taken down the carburetter and can find nothing wrong. Would you please advise me what to do?—W.C.

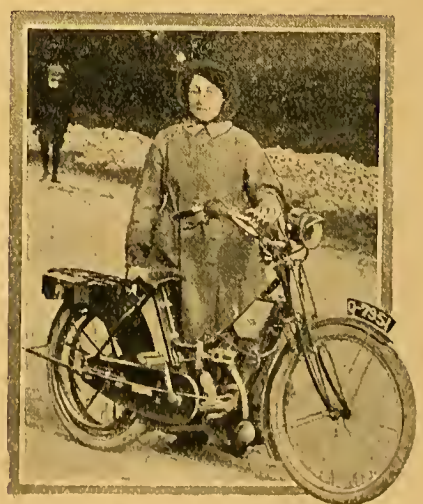
The trouble is probably due to the excess of solder on the float, which has disarranged the level of the petrol in the float chamber. You will have to reduce the petrol level slightly or make a neater job of soldering the float.

Touring in Germany.

I shall be taking my P. and M. and sidecar over to Germany shortly to visit some friends at Nuremberg and return again after about a week's stay. The route I intend to travel will be Queenborough-Flushing, Cologne-Nuremberg. I should be obliged if you would inform me—(1.) Whether I can obtain a triptych from the A.C.U., of which I am a member, which will enable me to pass my machine through the Customs duty free both in Holland and Germany? (2.) Will the machine have to carry a plate, and will the restrictions and formalities in force in Germany regarding motor cycles affect me in any way? (3.) What road maps should I have to obtain, and where can I get them? (4.) Will it be necessary to detach the sidecar when crossing, and what are the freight charges for both?—H.H.

(1.) We should strongly advise you to get into communication with the Auto Cycle Union Touring Department, 89, Pall Mall, S.W., without delay. They will give you valuable information regarding your route, and will arrange for your triptych and all details of the tour. (2.) You will have to carry an international plate, and at the frontier you will have to take out a *steuerkarte*. In Germany you drive on the right. (3.) Maps can be obtained from the Auto Cycle Union and Royal Automobile Club. Nearly every item in your letter could be answered in greater detail by the Royal Automobile Club Touring Department (to whom the A.C.U. will refer you). (4.) The cost of freight for a motor bicycle and sidecar from Queenborough to Flushing, or from Folkestone to Flushing is 30s. You need not detach the sidecar.

Oiling an Engine-shaft Gear.



Please tell me how often it is necessary to oil the N.S.U. two-speed gear fitted to my 1909 machine and how to do it.—E.P.D.

If the gear receives oil from the engine, if you over-lubricate the engine or give it rather more than the normal quantity of oil, the gear will lubricate itself. If, however, the gear receives no oil from the engine, undo the grub screw marked "oile" and inject engine oil through the hole by means of a squirt. This should be done about every 200 miles.

Cleckheaton to Chester.

Please tell me the best route from Cleckheaton to Chester, as I am thinking of fetching a motor cycle from there. I wish, if possible to avoid the big towns. Would *viâ* Preston and Liverpool be out of one's way, as the road from Chester to Preston is excellent?—L.C.R.

The shortest way (avoiding Manchester) is Cleckheaton, Huddersfield, Marsden, Mossley, Stalybridge, Ashton-under-Lyne, Stockport, Altrincham, Northwich, to Chester. If you wish to go *viâ* Preston your road will be Cleckheaton, Halifax, Todmorden, Bacup, Haslingdon, Blackburn, to Preston. The road from Burnley to Blackburn is bad, and you would have to traverse part of this.

Mrs. C. E. Ross, of Moseley, Birmingham, and her 2 h.p. three-speed Humber Lightweight. Mrs. Ross is a member of the Sutton Coldfield and Mid-Warwickshire A.C., and is a very keen rider.

Situations in the Trade.

I wish to obtain a situation in the motor cycle trade. Will you please tell me how to proceed. I have had practical experience with my own machine and four and a half years in the drapery business. Is trade riding the result of working one's way up?—A.J.

Your proper course would be to apply to those manufacturers with whom you would like to work. If you have not had mechanical training we do not think your chances are very good. A post as trade rider is sometimes the result of success in open hill-climbs.

Hill-climbing Formulæ.

Some time ago you published in *The Motor Cycle* a table showing bore and stroke of engines and their corresponding capacity. Could you supply me with a similar table, and let me know the date of that particular issue, as I wish to look it up? Should also be glad of a good formula for hill-climbs.—F.W.

The Cubic Capacity Table can be obtained from *The Motor Cycle* Offices, Coventry, price 4d. post free. It was published in the issue of June 17th, 1908. A good formula for hill-climbs is *The Motor Cycle* formula. See our issue for September 21st, 1911. It is as follows: For singles, $\frac{D^2 \times S \times t^2}{W}$, or more simply if you have the C.C. Table, $\frac{C \times t^2}{W}$. For multi-cylinders, $\frac{D^2 \times S \times N \times .9 \times t^2}{W}$, or $\frac{C \times .9 \times t^2}{W}$. You will find this very satisfactory.

Intermittent Running.

I have a 4½ h.p. V twin Hamilton motor (a.o.i.v. of course), to which I recently had to fit an odd rear cylinder of another make, but same bore and stroke and type. The ignition is by accumulator and tremblers, and the bicycle is fitted with an old B. and B. carburetter, which has always been satisfactory. The motor starts up well and accelerates quickly to almost any speed on advancing the spark, but after going three or four hundred yards it fails and stops altogether, and will do this repeatedly. (Wiring has been overhauled.) I have tried different accumulators and tremblers, with the same result. The engine will take nearly full air when once started. (I have cleaned the carburetter.) Compression is somewhat better in front cylinder than in rear. When going, a heavy passenger on the carrier does not seem to check the machine's speed in the least. (I have tested both sparking plugs.). How would you account for it failing thus, and what remedies would you suggest? It is difficult to tell whether it fails on both cylinders or one only. Is it worth while going to the expense of fitting machine up with a magneto?—E.A.

Your trouble is probably due to an obstruction in the petrol pipe or to an air lock in tank or pipe. A magneto would be an improvement, but whether it is worth while or not is for yourself to decide.

Ignition Timing.

I notice in reply to "C.B.R.," on the subject of "Valve and Magneto Timing," that you state that "the spark should occur at the top of the compression stroke when the magneto is retarded, not when fully advanced." I have always understood that the furthest you could advance the spark to was the top of the stroke, and that retarding caused sparking as the piston was descending. It probably accounts for the fact that my 3½ h.p. Triumph, 1910, is not giving me the power it should be since I readjusted the timing. (1.) When correctly timed, should the spark occur before the top of the compression stroke when the magneto is fully advanced? (2.) What are the most probable causes of overheating? (3.) Is the fact of exploding (viz., sparking) before the top of the compression stroke, when (a) running slow or (b) running fast, one of the causes in (2)?—C.A.B.

You will find an interesting article in *The Autocar* of April 13, pp. 674-5, on the subject of ignition timing. (1.) The movement of the engine piston is so rapid on small high speed engines used for motor cycle work, and the full explosion of the gases takes an appreciable time, therefore when the magneto is fully advanced sparking occurs before the piston has reached the top of its compression stroke. (2.) There are many causes of overheating, the chief of which may be too large a jet, too little air, carbon deposit inside the cylinder, insufficient lift of valve, incorrect valve timing, and ignition too far retarded. (3.) (a) If the explosion occur before the piston has reached the top of its compression stroke when running slow you will get knocking, and the engine will slow down until very soon it stops. If it continued it might possibly set up overheating. (b) The engine should not overheat with sparking occurring before the top of the compression stroke when the engine is running fast.

Carburetter and Coil.

I have an old 2¾ h.p. Minerva with B. and B. carburetter and plain coil. The carburetter is an old tank controlled one, and seems rather large for the machine; the jet is a No. 36. The throttle can be set so that the closing of same admits air through the adjustable air inlets only, or can be so set that no air or gas is admitted to cylinder at all on closing the throttle. (1.) Which is the correct setting of this carburetter, and why? (2.) Is a No. 36 jet too big for this machine? (3.) What would be about the correct sized jet for a 2¾ h.p.? (4.) Will the jets now sold in cases of three or four fit my old carburetter? (5.) Would the cheap kind of whistle at about 2s. 9d. be any good for my engine? (6.) My coil, a large round plain one, has a resistance in the primary winding of .8 amp., thus taking 5 amps. at 4 volts on continuous circuit. This seems to me very excessive. Is it possible this coil was meant to be used on 2 volts.—MAX.

(1.) Set the carburetter to admit pure air when throttle is closed, as this will help to cool engine. (2.) Yes. (3.) Number 29 would be right. (4.) The jets are suitable for carburetters made in 1908 (*et seq.*). (5.) Yes, if correctly fitted. (6.) Five amps. is certainly excessive, but we do not suppose your coil will work with two volts; you can try it by using one cell of the accumulator.

EXPERIENCES WANTED.

"M.W." (Cheltenham).—1911 or 1912 3½ h.p. Rex with two-speed gear, speed and wearing qualities.

"G.F.O." (Bassingbourn).—6 h.p. Rex-Jap 1912 model.

"Todavia" (Glasgow).—8 h.p. chain-driven Chater-Lea or Bat-Jap, tyre cost and petrol consumption with sidecar.

"S.H." (Durham).—3½ h.p. Quadrant three-speed, also Bowden and N.S.U. two-speed gears with 3½ h.p. and sidecar.

During the recent labour strike in Brisbane a number of members of the Queensland Motor Cycle Club offered their services to the police as a dispatch corps. They are depicted above.

A GREAT contrast to the unfortunate fiasco in the South, the re-run spring one day trial in the Midlands, was a great success. The course was a good one, and if it erred at all it was on the side of leniency, but it was almost as stiff as one could find in the district in which the trial had to be held. For the next event we shall have to go to Wales or some mountainous district to find hills of sufficient severity.

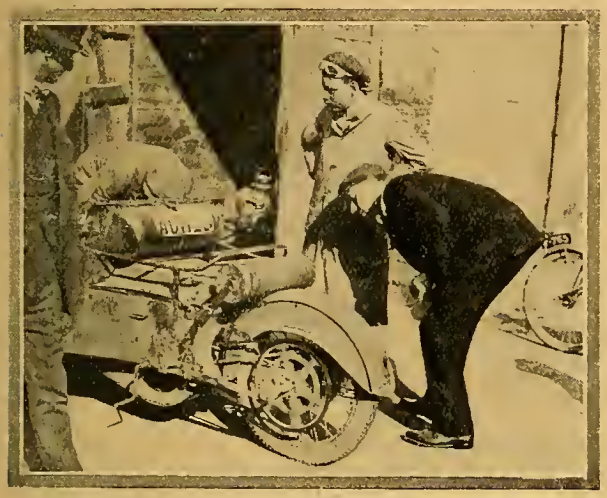
The yard of the Railway Hotel, Oxford, was not large, but of just sufficient size to accommodate the forty-five riders. The evidence of the A.C.U. assistant secretary's good organising powers was at once apparent. The machines were all arranged in numerical order, No. 1 being near the exit, so that there was no trouble about starting, and the judges could easily get at the machines to examine them.

At an early hour confusion slowly became transformed into order. Mr. Hart, assisted by willing helpers of the Oxford M.C.C., who were of valuable assistance through the trial, took charge of the scales. Mr. Beasley kept a watchful eye on everything, the judges set to work on their task of inspecting the competing machines, and route cards and armlets were distributed. Captain Davidson and Captain Nicholl worked with a will. The former, it may be remembered, is secretary of the Mechanical Transport Committee of the War Office, and as he superintends the purchasing and testing of machines used by the Army Service Corps he is thoroughly *au fait* with the industry. Captain Nicholl is himself a practical rider, who is not only a keen user of a 5-6 Clyno and sidecar, but keeps it in top notch tune in his private workshop.

Interesting Items on the Machines.

There were several interesting machines in the trial. Rothwell's Scott was fitted with an extra oil tank, W. E. Cook's A.S.L. had an injector form of extra air inlet, C. T. Newsome's smart-looking Rover had a gilled silencer, and was very quiet. The Morgan runabout was a particularly pleasing looking turn-out resplendent in its newness. Bischoff rode a glorified Triumph fitted with Armstrong three-speed gear, and a foot-controlled decompressor which he pronounced to be very near to absolute perfection. Mrs. Hardee, the gallant lady rider who made such a plucky performance in the last trial, was there on her P. and M., Johnson (3½ Triumph) used a Stewart-Precision carburetter, which appeared to work very well.

A veteran rider whom we were pleased to see on the road again after his recent accident was T. Silver. He was badly injured some little time ago by a machine which he was testing catching fire. The G.W.K. was another very smart runabout, an ingenious feature of which was the speedometer fixing. The dial of the latter was set flush with the dashboard, and very neat it looked. On a conveniently placed board in the hotel yard was placed a Bartholomew's map with the route marked thereon in red ink, and a notice



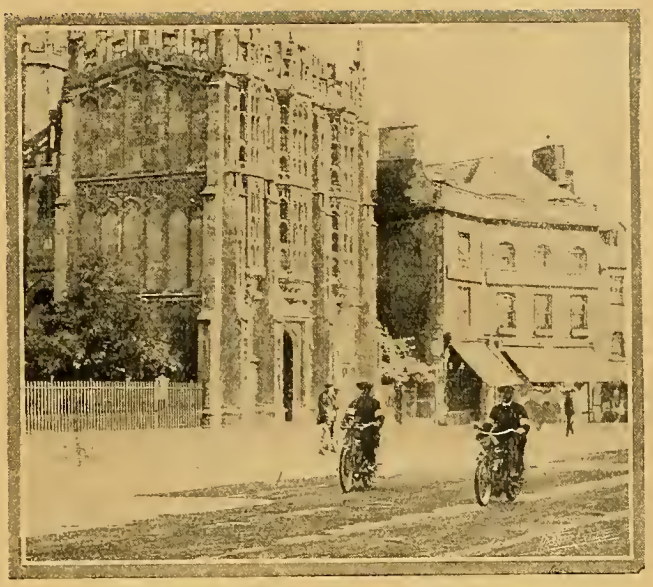
Scene in the yard of the Railway Hotel, Oxford, at the start of the trial.

The Re-run One Day Trial.—

that fifteen minutes would be allowed for *The Motor Cycle* tea stop. These marked maps were also supplied to the principal officials.

The Start from Oxford.

The first man left punctually at 8.30. The motor bicycle riders were got smartly away in pairs at one minute intervals, while the passenger machines were despatched singly. F. Smith (Clyno and sc.) could not compete owing to pressure of business. It was a glorious morning when the competitors left Oxford. First there came a ten-mile limit, which the Oxford City Fathers have imposed for reasons best known to themselves on an absolutely straight and safe road,



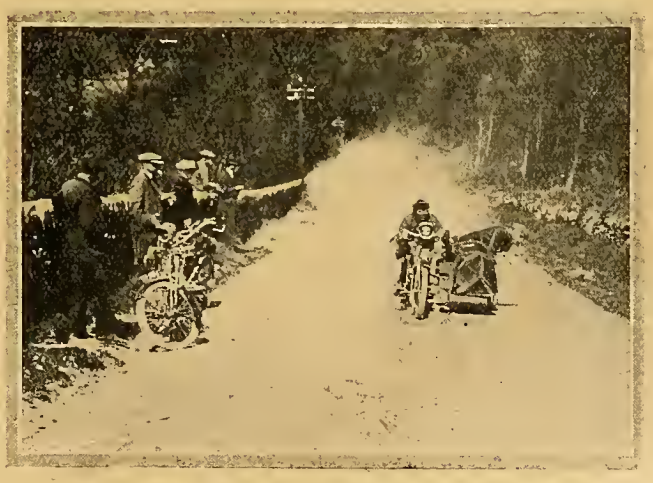
Judges examining machines before the start. The silencer on the new model A.C. sociable will be noticed.

which is practically open country, and then the ascent of Cumnor Hill, which the modern machine hardly feels. A cool breeze was blowing across the course which soon carried away what little dust there was. The route was particularly well marked; in fact, one official suggested it was too well done, and this excellent marking was particularly noticeable in Farringdon, which is a tricky little town to negotiate.

Up to Cirencester the road is good and presents no difficulties. In this fine old town we stopped and watched the competitors go by. A point policeman rendered valuable service at the cross roads, regulating the traffic and directing the men. The most conspicuous machine in the trial was Woodman's Bat, which was offensively noisy. No silencer of any kind was fitted, and the straight through exhaust pipes caused a deafening din. It is reasonable to suppose that even if this machine had not been put out of the running for various causes it would have been disqualified for noise alone.

A Surprise Hill at Uley.

From Cirencester the journey was continued through Tetbury to Dursley, and at this point the route became hilly. There then came a long winding descent through the village of Uley, followed by a bad twisty hill, which was almost as steep as Birdlip. Here Webster (Hobart) was brought to a standstill. After Uley the roads became narrow and very dusty until Stroud was reached.

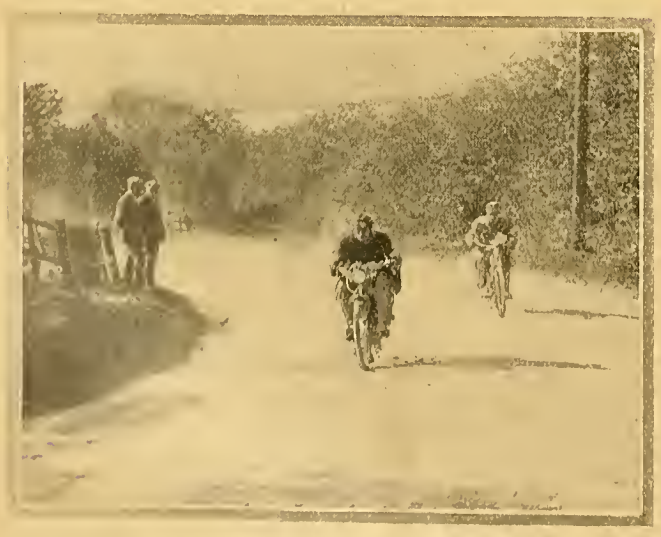


Two of the competitors passing Cirencester Parish Church.

The next interesting feature of the trial was the ascent of Birdlip, once the terror of the motor cyclist, now but an incident in a day's run. Birdlip lies on that fine old road, the Ermine Way, which the competitors joined by turning to the right at a point marked on the map as 220 feet above sea level. From here the road rises to 909 feet at the summit. The surface on the hill was excellent, but the wind blew gustily and seemingly in all directions during the ascent. While waiting for the competitors we saw an 8 h.p. Matchless and sidecar take three people up the hill without a falter.

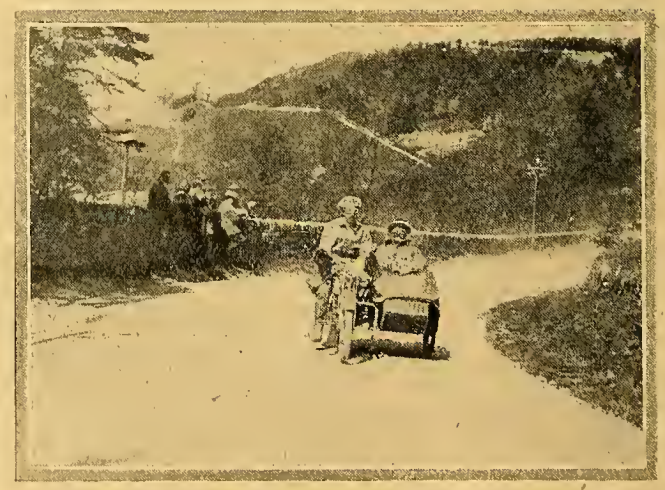
Observations on Birdlip.

Most of our observations were made on the Knap—the steepest portion—which is 1 in 5½. F. A. McNab (3½ Trump), who rode as No. 1, came up first in excellent style. F. Begley (2¾ Hazlewood) changed up as he topped the Knap. The following riders appeared to come up particularly well: W. E. Rootes (3½ Singer), R. Mundy (3½ Alldays), P. W. Bischoff



Alan Woodman (8 h.p. Bat and sidecar) making a good ascent of Birdlip.

The Autotrix cyclecar rounding the bend at the top of Birdlip Hill.



(3½ Triumph), L. Bees (3½ L.M.C.), D. H. Noble (3½ Rover), L. Cass (4½ Quadrant), W. E. Cook (3½ A.S.L.), R. A. Bishop (2¾ Enfield), R. Lord (6 Rex), T. R. Trotter (3½, B.S.A.), P. J. Evans (3½ Humber) who was travelling on top speed, J. St. John (3½ Quadrant), J. Slaughter (3½ L.M.C.), W. B. Gibb (2¾ Douglas) who made a splendid ascent, R. H. Viggers (3½ Macbeth-Precision), A. V. Deacock (3½ Alldays), H. Johnson (3½ Triumph) a very fine performance, J. S. Holroyd (2½ Motosacoche, which was the lightest machine in the trial) came up without pedalling, C. R. Collier, H. A. Collier, and R. E. Guest (all on 8 h.p. Matchless machines and sidecars) came up in excellent form. J. Chater-Lea, jun. (8 Chater-Lea and sc.), also made an excellent ascent. J. T. Wood (8 G.W.K.) made a splendid climb which should go far towards dispelling any prejudice which may exist against friction drive. The Morgan came by us at a splendid pace, but almost on the crest of the hill it stopped, ran back, restarted, and finished without difficulty. The Autotrix came up well, as also did the A.C. Hill, the driver of the latter, stopped to change a faulty plug, and arrived late. Mrs. Hardee (3½ P. and M.) came up slowly, but made a clean ascent. Poor Silver climbed the hill on a flat tyre, which troubled him several times again during the day. J. H. Kerr (3½ N.S.U.) failed through a broken belt fastener. R. R. Rothwell (4 Scott) missed his change and stopped on the Knap. W. B. Whitaker (3½ Rudge), H. Beal (3 N.S.U.), and H. J. Woodgate (3½ Macbeth-Precision) dismounted, while Applebee had to stop owing to a sooted plug. The minimum hill speeds were: Up to 350 c.c., 10 m.p.h.; over 350 c.c., 15 m.p.h.; passenger machines, 7 m.p.h. The following competitors climbed the hill at less than minimum speed: Mrs. Hardee (3½ P. and M.) and F. Hill (5-6 A.C.). T. E. Seear (Motosacoche) arrived too late to be timed.

Two Motosacoche competitors on Sunrising Hill.

Along the Ridge of the Cotswolds.

After the hill-climb there followed a fine drive along the ridge of the Cotswolds, from which there was a glorious view, and then came the descent of Leckhampton Hill into Cheltenham, where lunch was served, and the machines were stored in Steel's garage.

C. R. Collier (8 h.p. Matchless sidecar) coming up Birdlip. A similar machine (not in the trial) ascended the hill with three up.

Several incidents had happened by lunch time. Tessier (Bat and sc.) had chain trouble and a puncture, and ran into the wall coming into the garage. He retired eventually. Tillman (6 Zenith and sc.) gave up at Cirencester owing to belt trouble, and the G.W.K. had suffered a puncture. Woodman (Bat and sc.) had trouble with a stretched valve and sooty plugs, and gave up at Birdlip.

After lunch came the long, trying ascent of Cleeve Hill out of Cheltenham, which was all the more troublesome owing to a strong head-wind.

We noticed that W. E. Cook (3½ A.S.L.) made a very fine ascent of this hill. Here Kerr (N.S.U.) again had trouble owing to a slipping belt, and had to dismount. After Cleeve Hill the road was good, but winding, to Broadway, and rather intricate; but thanks to the splendid arrowing—which, we understand, was carried out by Mr. A. H. Priestly—there was no difficulty in finding it.

Saintbury is a pretty ascent—long, rough as to surface, and of a gradient not much worse than 1 in

The Re-run One-day Trial.—

6 to 1 in 11. It was more difficult to negotiate than Birdlip, but not nearly so severe as any one of the timed hills in last year's Six Days' Trial. Most people climbed it without difficulty, and most of the bicycles hardly noticed it.

Gibb (Douglas) again made a fine ascent, while the following other performances stand out pre-eminently in our memory: C. T. Newsome (Rover), W. E. Cook (A.S.L.), J. S. Holroyd (Motosacoche), L. Cass (4½ Quadrant), J. Chater-Lea (Chater-Lea and sc.), J. T. Wood (G.W.K.), H. F. S. Morgan (Morgan), the Autotrix, and the three Matchless side-car machines. F. W. Applebee, sen., was still troubled with misfiring, but made a clean ascent; Kerr (N.S.U.) stopped and hampered St. John (Quadrant); Whitaker (Rudge) and Woodgate (Macbeth-Precision) dismounted; Webster (Hobart) pedalled.

Sunrising Hill.

The run to Sunrising Hill was through beautiful country, and part of it followed another famous Roman Road, the Fosse Way, to Ettington, there joining the Stratford-Banbury road which leads to Sunrising. Here again most people made a clean ascent. Gibb got up on top speed—no mean performance for a lightweight. Those who dismounted were Mrs. Hardee and H. Woodgate. We were told that the stop for tea, provided by *The Motor Cycle* at "The Tower," Edge Hill, was much appreciated, and certainly the proprietor carried out his part of the programme very well, while Mr. A. H. Priestly did excellent work at that place as marshal.

The Organisation.

The remaining 30 miles to Oxford was through practically flat country and over excellent roads. All that can be said against the trial was that it was a trifle too easy. Yet although this was said pretty freely, 21 competitors out of 45 starters failed to secure an absolutely clean sheet. The trial was a great success, and those responsible for its organisation deserve to be warmly congratulated. The time-keepers were Messrs. F. T. Bidlake and A. V. Ebblewhite, who were conveyed from point to point by Mr. J. R. Nesbit. Other officials were Messrs. F. G. Barton, E. C. Cooper, R. C. Davis, John Gibson, W. A. Matthews, W. Pearson, A. Ross, F. Salter, H. E. Steel, and members of the A.C.U., Oxford M.C.C., Coventry and Warwickshire M.C.C., Bristol M.C.C., Bristol B. and M.C., Birmingham, Worcester, and Gloucester M.C.C.'s.

Mr. Oswald Cole, chief constable of Oxford City, was an interested spectator at the start and finish. The Oxford county police did excellent work in directing the traffic at cross and side roads on the course during the afternoon over that part of the route which traversed Oxfordshire.

CERTIFICATES OF PERFORMANCE. MOTOR BICYCLES.

Rider and Machine.	No. of Cyls.	Bore and Stroke.	Cubic Capacity.	Gear.	Weight of Machine	Remarks.
		mm.			lbs.

*Alan Woodman (8 Bat & sidecar)	2	85.5 × 85	964	Bat 2-speed	Valve, plug, and sidecar trouble; disqualified for excessive noise.
*Ernest Vallis (5-6 Clyno sidecar)	2	76 × 82	774	Clyno 2-speed	Finished outside maximum time.
*F. R. Tillman (6 Zenith & sidecar)	2	76 × 85	862	Gradua gear	Retired, belt trouble Cirencester.

* Private owners.

JUDGES' REPORT.

The postponed Spring One-day Trial was held on Wednesday, April 24th, starting from the Railway Hotel, Oxford. The distance was 152½ miles, and the route followed was Faringdon, Fairford, Cirencester, Tetbury, Dursley, Stroud, Birdlip Hill, Cheltenham, Broadway, Saintbury, Moreton-in-the-Marsh, Sunrising Hill, Banbury, Deddington, to Oxford. The timed hills were Birdlip and Saintbury, and, in addition, several hills were included at Uley, Cleeve, and Sunrising. The route for the most part was over main roads, and although not so severe as the one selected in March last, it formed a very good test of the capabilities of the machines, as shown by the comparatively small percentage of first-class certificates obtained.

WEATHER.—The weather conditions were as good as could be desired, although there was a strong wind blowing against the competitors for some miles after the luncheon stop.

ROADS.—The roads were in very good condition throughout, but in a few places they were dusty.

ENTRIES.—Thirty-two single and thirteen passenger machines were entered. Of these only one, a passenger machine, did not start. Only two of the machines were fitted with fixed gears.

AWARDS.—Fifteen first-class certificates were awarded to single machines, and five to passenger machines. In addition to these, two machines would have obtained first-class certificates but for the fact that they had not complied with the regulation requiring a free engine clutch or variable gear, and four machines lost first-class certificates through tyre trouble.

FAILURES.—Birdlip accounted for seven failures, but the other hills did not appear to present any great difficulties. The speeds attained on the timed hills were in most cases well above the minimum required.

CLEANLINESS.—There is still room for considerable improvement under this heading. The very clean condition of two similar machines showed that this end can be attained. Some machines were particularly bad in this respect, more than one first-class certificate being lost through this defect. The oil leakages were not confined to any one particular part of the machine, but often appeared to be general.

SILENCERS.—Many of the machines are still too noisy, and considerable improvement is required in this respect. Here again the presence of quiet machines showed that it is possible to achieve silence without loss of efficiency. One machine was disqualified for excessive noise.

GENERAL CONDITION.—There appears to be a tendency with some riders to neglect the cycle parts, such as the head and hubs. The front wheel brakes in some cases did not free themselves well when released. In one instance the two brakes acted independently on the belt rim, a system which does not appear to be altogether desirable.

TYRE TROUBLES.—As already stated, four first-class certificates were lost through this cause. It would appear to be highly desirable, in view of the greatly increased horse-power developed by modern engines, that heavier tyres should both be made for use on motor cycles and actually fitted to them as standard.

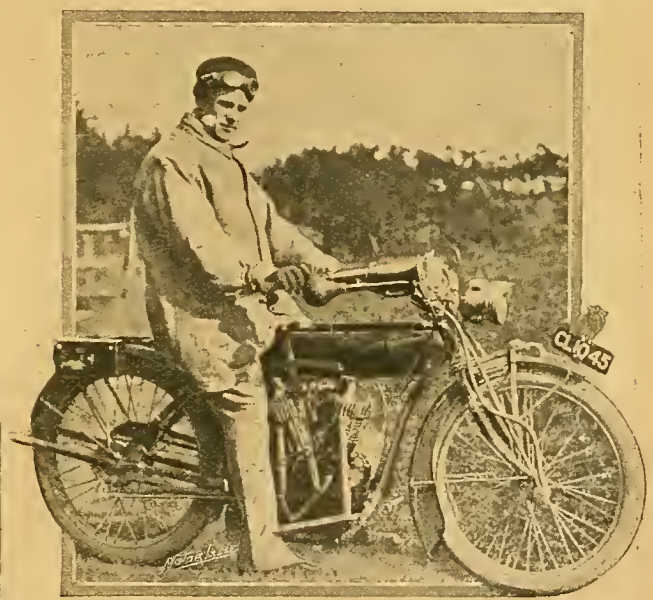
(Signed) { D. F. NICHOLL, Captain R.A.
H. E. DAVIDSON, Captain R.E.

H. S. Meen (three-speed New Hudson), winner on formula of the touring single cycle class in the Middlesbrough and District Hill-climb at Castleton on the 20th ult. (See Club News pages).

MOBILISATION DAY AT DAVENTRY.

A group of some of the motor cyclists who responded to the call to mobilise in Daventry on Saturday last. The men rode from all parts of the country. The average speed of the participants in the test works out at 30.1 miles per hour.

CONSIDERING all things the mobilisation test of Saturday last must be considered fairly successful. Out of 173 who sent in their applications 99 put in an appearance at Daventry, the rendezvous, before the lists were closed at 5 p.m., and some 37 others arrived after that hour, including one rider from Glasgow. Before I proceed to discuss the military lessons of the test I will give the results as compiled from the official register.



From the following cities and towns two or more riders arrived before 5 p.m.: London 11, Coventry 7, Birmingham 6, Manchester 6, Liverpool 4, Shrewsbury 4, Northampton 4, Nottingham 4, Hull 3, Southampton 3, Sheffield 2, Doncaster 2, Swansea 2, Cardiff 2, Leamington 2, and Bradford 2.

The rider who came from the furthest point away from Daventry was R. P. Chester, 33, Leicester Street, Southport (3½ h.p. Triumph), who rode the 160 miles in 5h. 48m. The best run of the day, and the first actual man to arrive was R. A. Milligan, Laxfield Hall, Suffolk (7 h.p. Indian); he accomplished the 130 miles in 4h. 1m., starting at 4 a.m. on Saturday. W. E. Rootes (3½ h.p. Singer) rode the nineteen miles from Coventry in 27m.

Captain A. H. Trapmann, the organising officer of the mobilisation test, receiving competitors' cards as they arrived at the rendezvous.

The all-round average speed of competitors works out at 30.1 miles per hour, and the average distance travelled at 69.8 miles. The only counties in England not represented were Northumberland, Cumberland, Devon, Cornwall, and Durham. During the afternoon hill-climbing tests were carried out on Newnham Hill. No single machine failed to make the first ascent, but no times were taken, as this was not considered of

R. A. Milligan (7 h.p. Indian), the first competitor to arrive at Daventry. He left his home in Suffolk at 4 a.m. on Saturday, and was in Daventry soon after 8 a.m.

military importance in the hill-climb itself. At the second test, where machines were called upon to restart on the stiffest portion of the gradient, only one of those who tried failed to reach the summit.

The variety of machines employed was almost as varied as the places the riders hailed from, and none of the best known makes was unrepresented. Triumphs, P. and M.'s, Rudges, and B.S.A.'s head the list, and amongst others there were three big Indians.

These are the facts and figures which we have to go upon. The next point is what do they teach us?

Mobilisation Day at Daventry.—

General Thorneycroft (right), Captain Trapmann (centre), and Major Symons (left).

Lessons of the Test.

Firstly, we find that in peace time under peace conditions and speed limits the average keen motor cyclist can be counted upon to ride at a speed of 30 miles an hour over long distances, and judging by the reports handed in the modern motor cycle is practically accident-proof. This means that under war conditions any service of motor cyclists that was organised could be scheduled to run at 35 miles an hour on relays, and when it is remembered that unless permanent ways are guarded and patrolled throughout their length railway trains in war time are not scheduled to do over 15 miles an hour, it will be seen that even where railways exist between two given points the motor cycle is more than twice as swift.

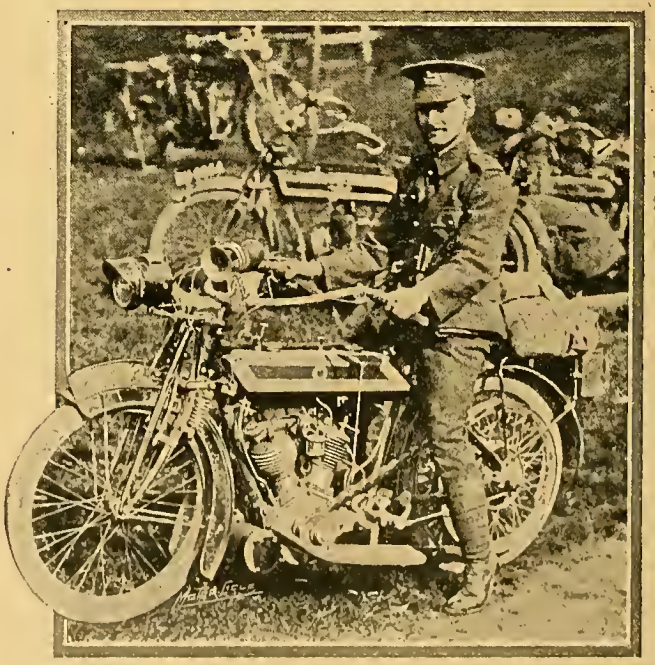
As compared with telegraphic communication, the motor cycle has already in repeated tests been proved superior for any distance under thirty-six miles, whilst for distances up to sixty it is largely a matter of congestion of messages on the one hand and of weather conditions on the other.

Address by General Thorneycroft.

These are some of the basic conclusions on which to form our judgment. In the address given at the conference by General Alexander Thorneycroft, C.B., commanding the South Midland Division, very great stress was laid upon the value of the motor cycle in modern warfare, and the plain fact of the matter is this, that although we have thousands of excellent motor cyclists in the country, there is at present no suitable provision in the regulations for them to serve in the Regular or Auxiliary Forces. In the course of a few weeks doubtless the regulations will be amended, and it will then remain to be seen whether they are of a nature likely to appeal to the sort of man who owns a motor cycle.

How to become a Recognised Military Motor Cyclist.

At present there are only two authorised methods of becoming an officially recognised military motor cyclist, either to join a Divisional Telegraph Company R.E. of the Territorial Force as a Territorial soldier (100 vacancies in all) or to join Section B of the Special Reserve (100 vacancies); in the latter case the motor cyclist should first join the Territorial Army and then be transferred so soon as he has accomplished his recruit drills. He will get a retaining fee of £4 per annum, engineer pay plus 6s. 6d. a day whilst called out for training, which will be for a period of fifteen days, with the Regular Army at manœuvres.



Doubtless this latter offer will prove attractive to those who are keen on military matters and who can undertake the liability to go abroad with the Regular Army if sent away on a foreign war.

Doubtless also in the course of the next few weeks the long-delayed authority will be promulgated permitting each of the existing thirteen cyclist battalions in the Territorial Army to enlist one officer and seventeen motor cyclists. These will draw the ordinary pay and allowance of their rank whilst at annual training and a petrol allowance, which, it is rumoured, will amount to 7s. 6d. a day.

Objects of the League.

That is exactly how matters stand at present. It is the object of the legion of cyclists to enrol 2,000 motor cyclists, who in the event of a national emergency would turn out to serve their country. Without a shadow of doubt, when that emergency arrives emergency regulations will be made to absorb that number—they will be urgently required.

In the meanwhile the legion wishes to organise them, teach them their duties, and prepare for war, whilst the military authorities are still chewing the cud of pensive reflection. CELERITER.

Private Schulton (6th West Yorks.), who rode his twin Rex from Bradford to Daventry to participate in the mobilisation test of motor cyclists on Saturday last.

CURRENT CHAT

TIME TO LIGHT LAMPS.

May	2nd	... ...	8.21 p.m.
,,	4th	... ...	8.25 ,,
,,	6th	... ...	8.28 ,,
,,	8th	... ...	8.31 ,,

Good News of Cheshire.

All motor cyclists will be glad to hear that E. W. Cheshire, who fell at Chew Hill, is progressing favourably, and it is hoped that he will be able to leave hospital before the end of this week.

The Cyclecar Movement.

Coventry is the centre of the motor cycle trade, and, therefore, it is hardly surprising to find that three large concerns are interesting themselves in cyclecars, and are making arrangements for large outputs in 1913.

Tourist Trophy Races.

The following have notified the A.C.U. that they intend to compete in the Tourist Trophy Races:

SENIOR RACE.—C. E. Murphy and J. A. Hoffmann.

JUNIOR RACE.—H. Huckley (Enfield).

Mr. T. W. Loughborough leaves for the Isle of Man on the 13th inst. to make preliminary arrangements for the race week.

A.C.U. General Committee.

A large number of nominations have been received by the Auto Cycle Union for the eighteen vacancies on the General Committee reserved for the representatives of the affiliated clubs. The ballot papers have been circulated to all the clubs, who are entitled to one vote in respect of each twenty-five members or portion thereof. The papers must all be returned to the Auto Cycle Union not later than Saturday next, the 4th inst.

Restarting Tests in Lyons Reliability Trial.

The Motor Cycle Club of Lyons held a touring reliability trial on the 28th ult. Great interest was taken in the class for variably geared machines. Among the machines which took part in this were Motosacoche, Terrot, Rivière, and Clément. The variably geared machines had to be stopped on two steep hills, viz., Cerdon and Serriers, and restarted by the aid of the clutch. Riders in this class had to weigh not less than 11 st. 11 lbs. The results were as follows:

CLASS I., 250 c.c.—1, Perrin (Peugeot).

CLASS II., 333 c.c.—1, Stoffel (Alcyon); 2, Ponti (Moto-Rêve).

CLASS III., 417 c.c.—1, Ludovic (Alcyon).

CLASS IV., 500 c.c.—1, Ex-officer (Magnat-Debon); 2, Pernette (Française); 3, Gabriel (Triumph).

CLASS V., 750 c.c.—1, Pouy (Moser).

CLASS VII., VARIABLE GEARS. — 1, Guignet (Motosacoche); 2, Gream Fenton (Clément); 3, Golaz (Clément).

A Police Trap on Watling Street.

We are informed that a police trap is in operation at Watling Street between the Four Crosses and Gailey Cross Roads.

C.T.C. Circular Tour.

The Cyclists' Touring Club announces a motor cycle circular tour.

The general idea is a twelve days' run with London for the start and finish, and taking in the following centres: Bristol, Birmingham, Manchester, Leeds, Newcastle-on-Tyne, Edinburgh, Glasgow, Keswick, Bradford, Leicester, and so back to London.

The tour will be in no sense a competition, or trial, it will be a demonstration pure and simple, nevertheless we hear certificates will be awarded.

Herts County A. and Ae.C.

At a meeting of the General Committee held last week, resolutions were passed revoking the appointment of the committee of the motor cycle section and its officers, and handing over the control of that section to the General Committee and officers of the club. The officers and members of the motor cycle section have, therefore, handed over the control of their section to the General Committee, as the former could not see their way to sign the indemnity required by the latter for 1912. It was further resolved that a sub-committee of the motor cycle members, to be approved by the General Committee, be formed for the purpose of organising competitions.

SPECIAL FEATURES.

Mobilisation Day.
Re-run One Day Trial.
Bristol B. and M.C. Hill-climb.
Making the Best of It (Illustrated).

Funeral of the late Mr. A. J. Moorhouse.

The funeral of the late Mr. A. J. Moorhouse, whose sad death was recorded in last week's issue, took place at the Dury Cemetery, near Manchester, on Wednesday of last week. Some idea of the late lamented rider's popularity may be gathered from the following list of names of individuals and bodies associated with the sport and pastime who sent wreaths: Mr. and Mrs. W. H. Wells, Mr. and Mrs. Broadhead (Northern Supply Co.), Mrs. Stenson Cooke, Messrs. Percy Butler, G. N. Higgs, N. D. Slatter, Ernest Frasetti, the committee of the M.C.P.A., The Motor Cycling Club, the Hendee Manufacturing Co. London Staff, *The Motor Cycle*, the A.C.U., the B.M.C.R.C., directors of Rudge-Whitworth, Ltd., Hutchinson Tyre Co., Staff of the Northern Supply Co., A. H. Horn, the Rex Manufacturing Co., Manchester M.C., Anglo-American Oil Co., Manchester, members of the Bradford M.C., members of the Stockport M.C., Imperial Boys' Manchester M.C., Britannia Lodge No. 3,005, workmen of the Rex Motor Mfg. Co., Coventry, staff of Motor Cycling, London, Streatham and District M.C.C., and Bristol B. and M.C.

The G.W.K. cyclecar on Sunrising. This machine unfortunately suffered a puncture, or it would have made a non-stop run in the A.C.U. One Day Trial.

Next Saturday's Brooklands Meeting.

Seventeen entries have been received for the Seventh Short Race on Saturday at the B.A.R.C. meeting at Brooklands, and fifteen for the Sixth Long Race. First race 2.25 p.m.

Fresh Identification Marks.

New identification marks have been allotted to Middlesex ("MX" in addition to "H") and to the County of London—"LF" in addition to those already allotted, which are A, LC, LN, LB, LD, LA, and LE.

A Stolen Machine.

A brand new T.T. Roadster Triumph with dropped handle-bars was stolen from the coach house of Mr. F. H. Cotterill, East View, Sutton Road, Walsall, on the night of Friday, the 19th ultimo. The numbers on the machine are: Frame No. 192539, engine 19011, magneto 984860. The owner offers £5 reward to anyone who will give information which will lead to the recovery of the machine.

The Late Mr. A. J. Moorhouse.

Mr. W. H. Wells, of the Hendee Co., wishes to express his very great appreciation of the many letters of sympathy received by him from numerous friends of the late Mr. Arthur J. Moorhouse. These are so numerous that he finds it impossible to answer them all. Mr. Wells also asks us to point out that any reference made in the last issue to records at Brooklands was done under a misapprehension.

The London-Edinburgh.

This important event will be held on the 24th to 26th inst. The meeting place is the Old Gatehouse, Highgate, on Friday evening, May 24th, where a hot supper will be served at 7 p.m. sharp. All machines must be at the starting place at 7.30, and competitors will be started at nine o'clock at suitable intervals, and in the following order: Motor bicycles first, sidecars second, cyclecars third, and cars fourth. The finish will be at the Royal Hotel, Princes Street, Edinburgh. The awards, which are numerous, are—single and return journey—gold medals in all classes, M.C.C. Challenge Cup for motor bicycles only, "Wells" Cup for sidecars single journey, "Clark" Cup for sidecars double journey, and "Fry" Cup for cyclecars double journey. Gold medals will be awarded to every rider (except the winner of the "Wells" Cup) reaching Edinburgh in twenty-three hours, silver medals within twenty-four hours, and bronze medals within thirty hours. Speedometers will be allowed this year.

Among those who have already entered are: W. Cooper (Bradbury), Geo. Brough (Brough), R. M. Brice (Brown), Southcomb May (Portland-Jap), and Owen Wells (Bradbury and sidecar), L. A. Baddeley (3½ Baddeley), N. O. Soresby (3½ Rudge), W. Pratt (3½ P. and M. and sc.), N. Greaves (2¾ Enfield), Gordon B. McKechnie (8 Dot-Jap), A. C. Robbins (3½ Humber), D. Gibbons (3½ Rover), J. Parnacroft (cyclecar), F. J. Watson (3½ Swift), Dr. Stanley (5 Indian), A. Mabon (3½ Rudge), E. Gwynne (7 Indian), J. R. Haswell (7½ Triumph and sc.), Harry G. Bell (5-6 F.N.), and J. Kerr (3½ N.S.U.) The president, Mr. Chas. Jarrott, will again drive through the run, and twenty cyclecars are expected to take part.

FUTURE EVENTS

May 4.—Coventry and Warwickshire M.C. Open Reliability Trial

" 4.—Mersey M.C. Open One-day Trial.

" 4.—Dublin M.C.C. Open Reliability Trial.

" 4.—Glasgow M.C.C. Open Spring Hill Climb.

" 11.—B.M.C.R.C. Race Meeting.

A special heading for competition announcements will be found at the end of the miscellaneous advertisement columns.

The Coventry and Warwickshire M.C. Open Reliability Trial.

Over sixty entries have been received for the above club's open reliability trial, which will take place on Saturday next, starting from Coventry at 8.30 a.m. The route, which is a secret one, and will only be made known to the competitors on the morning of the event, comprises a number of steep hills, and the performances of the machines on each of these will be observed by officials of the Coventry and neighbouring clubs. The event promises to be one of the most successful ever held by the club. The performances in the cyclecar class will be particularly interesting.

The First Motor Cycle Race.

The first hon. secretary of the Motor Cycling Club, Mr. George E. Roberts, wishes to correct the statement made in the article, "Ten Years' Experience of the Pastime," by Mr. F. Straight, and published in the last issue. Mr. Straight said that the first purely motor cycle race meeting was held on the Crystal Palace track in August, 1902, whereas Mr. Roberts points out that the first race meeting confined to motor cycles was engineered by the Motor Cycling Club, and was, he thinks, held in January or February, 1902.

Errors in Timing.

The following amended times in Classes 6, 7, and 10 in the Bristol M.C. open hill-climb have now been issued: Class 6—3rd, R. Holloway (Premier), 46⅖s. Class 7—3rd, F. P. Davies (Rudge and sc.), 1m. 13⅖s. Class 10—2nd, E. Kickham (Douglas), 53⅕s.

B.M.C.R.C. Race Meeting.

The third members' meeting will be held at Brooklands on the 11th inst. Racing will commence at 1.30 p.m. and will comprise the following events: The second 1912 time trial for the kilometre and mile flying starts. The 500 c.c. car challenge race for motor cycles of any type, distance (3 laps) 8 miles 269 yards. The second 5 lap cyclecar handicap, distance 13 miles 1,035 yards. The 750 c.c. car challenge race The 1,000 c.c. and the 50 mile senior T.T. race for heavy weight motor cycles complying with the T.T. regulations, except that mudguards, etc., may be removed. Entries close on the 4th inst.

Paris-Trouville.

A successful reliability trial was held on the 21st ult. by the Touring Moto Club of France from Paris to Trouville. Unfortunately several of the competitors suffered punctures owing to someone having strewn nails all over the road at one part of the course. There were a few tumbles, fortunately without injury to the riders, in the neighbourhood of Evreux and Lisieux. The event was divided into two classes. Those who arrived at Trouville and averaged 18½ m.p.h. were:

FIXED GEAR CLASS.—Brunet (2½ Griffon), Desitter (2 N.S.U.), Gabriel (3½ Triumph), Naas (3½ Griffon), Poulain (2 N.S.U.), Paul (2 N.S.U.), and Quatrenoix (2¾ Motosacoche).

VARIABLE GEAR CLASS.—O. de Carfort (3½ N.S.U.), Mme. Despaignes (2¾ Motosacoche), M. Despaignes (2¾ Motosacoche), Dubost (2¾ New Hudson), Gompertz (2¾ New Hudson), Portejoi (2¾ Motosacoche), De Vay (2¾ Clément), and Weill (2¾ New Hudson).

Sheffield and Hallamshire M.C.C. Speed Judging Contest. Some of the competitors waiting for the starting signal. (See Club News, pages 490-491.)

BRISTOL B. & M.C. HILL-CLIMB.

A MOST successful hill-climb was held by the above club at Clapron in-Gordano, near Portbury, and the club is to be congratulated on the thoroughness of its arrangements and the promptness with which the machines were got away. There was a slight delay at the start owing to one of the official timekeepers being late, but except for this everything went smoothly.

The hill was an excellent one for a climb—it is approximately two-thirds of a mile in length, and has an average gradient of 1 in 7. The start was on an upward slope, and almost immediately the competitors had to take a sharp right-handed turn and found themselves on a 1 in 6 grade; after this the hill eased somewhat and allowed the riders to get up speed. Not far from the top of the hill there is a right hand bend with a nasty hump on the road surface, but only the fastest machines had to be cut out here.

EVENT 1 (for single-cylinder lightweights) provided some wonderful performances. Berwick's New Hudson went up in fine form, as also did Barne (Zenith) and Slatter (Alcyon). Cocker's Singer came up well, but seemed to be over-geared. In this class Edmond's little Humber made a really wonderful climb for so small an engine.

EVENT 2 (twin-cylinder lightweights) was a Douglas success, Kickham's machine showing up wonderfully. His exhaust had the clean sharp bark of a perfectly tuned engine. We noticed several of the Douglases were fitted with Amac carburetters.

EVENT 3 (touring twins and singles).—Newman (Ivy-Precision) made fastest time, closely followed by Kickham (Douglas) and Harry Reed (Dot).

EVENT 4 (touring singles) was chiefly noticeable for the fact that Davies (Rudge), Kickham (Rudge), and Dixon (New Hudson) all made exactly the same times and tied for third fastest time. Newman and Reed again came up very fast.

EVENT 5 (for ladies) produced only two riders—Mrs. Simpson (Rudge) and Miss M. Hind (5 Rex). Both came up well, and the latter made a very fast climb.

EVENT 6 (the fastest times for racing machines) went to Dixon, Miss M. Hind, and Maurice (Premier).

Competitors waiting for their machines to be weighed at the foot of the hill.

Miss Hind rode extremely well, but by keeping close in to the side of the road encountered some nasty bumps. Haskins (Singer) and V. Taylor (Rudge) both showed up well in this class.

EVENT 7 (passenger machines).—Barnes made very fast time on his Zenith sc. W. W. Douglas brought up the Williamson sidecar in style and tied for second fastest time with Wade (Zenith).

EVENT 8 was for racing singles decided on time only. It was won by Newman on his Ivy-Precision. He had been improving his times at every ascent, and in this class made fastest time of the day. H. Reed (Dot) was second, and Tanner (Triumph) third. Webb (Premier) and Dixon (New Hudson) also made fast climbs.

EVENT 9 (for amateurs) provided the second and third fastest times of the day. They were made by

J. Cocker (2½ h.p. Singer) just entering the straight after rounding the first bend.

H. Read (3½ h.p. Dot), second on time in two classes, passing the finishing banner.

Vernon Taylor's Rudge and Kickham's Douglas respectively. After the climb both officials and competitors adjourned to the Full Moon Hotel, where a very excellent supper was prepared. Everything went with a swing, and toasts of "The Ladies," "The Club," "Competitors," and "Motor Cycle Press" were all duly honoured, and afterwards a concert was held.

Time results:

EVENT 1. (Lightweight singles, 315 c.c.)

H. Berwick (2¾ New Hudson)	48⅘s.
F. W. Barnes (2¾ Zenith)	52⅕s.
F. G. Edmond (2 Humber)	55⅗s.

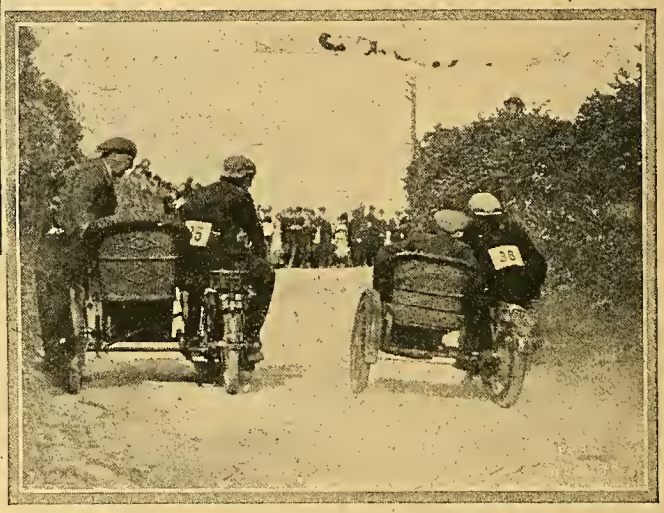
EVENT 2. (Lightweight twins, 344 c.c.)

E. Kickham (2¾ Douglas)	47⅕s.
W. W. Douglas (2¾ Douglas)	45⅗s.
F. Ball (2¾ Douglas)	45⅗s.

EVENT 3. (Touring singles, 500 c.c.; twins, 650 c.c.)

H. C. Newman (3½ Ivy-Precision)	41s.
E. Kickham (2¾ Douglas)	43⅖s.
H. Reed (3½ Dot)	45⅗s.

EVENT 4. (Touring singles, 500 c.c.)



H. C. Newman (3½ Ivy-Precision)	40⅘s.
H. Reed (3½ Dot)	44s.
F. P. Davies (3½ Rudge)	47⅖s.
E. Kickham (3½ Rudge)	47⅖s.
H. G. Dixon (3½ New Hudson)	47⅖s.

EVENT 5. (Ladies.)

Miss M. Hind (5 Rex)	45⅖s.
Mrs. Simpson (3½ Rudge)	52⅖s.

EVENT 6. (Racing, 1,000 c.c.; time only.)

H. G. Dixon (3½ New Hudson)	44s.
Miss M. Hind (5 Rex)	44⅕s.
A. P. Maurice (3½ Premier)	45⅖s.

A. B. Wade (3 h.p. Zenith sidecar), who tied with W. W. Douglas (Williamson sidecar) for second place, starting in the passenger class.

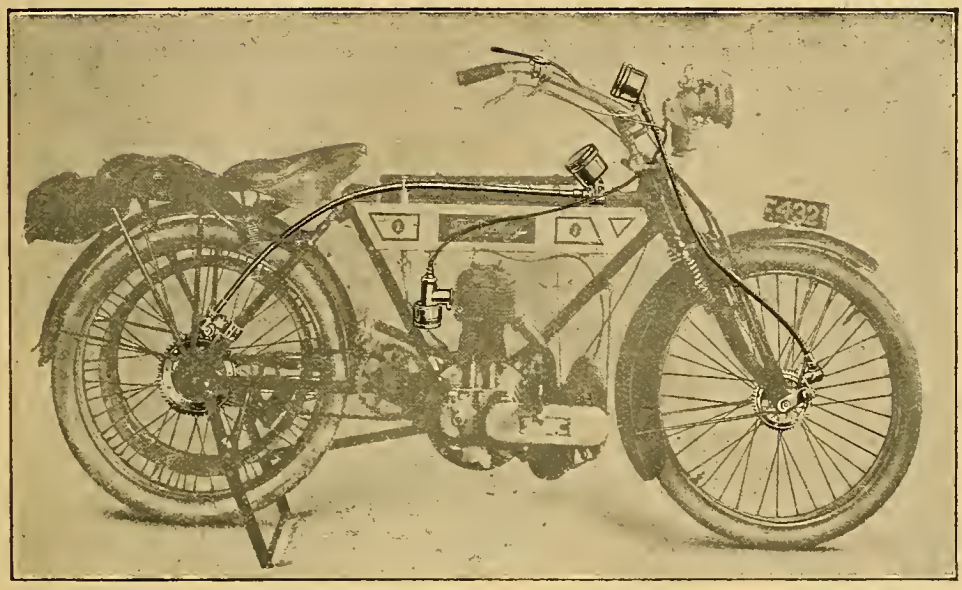
EVENT 7. (Passenger, 1,000 c.c.)

F. W. Barnes (8 Zenith)	49⅘s.
W. W. Douglas (8 Williamson-Douglas) ...	54⅖s.
A. B. Wade (6 Zenith)	54⅖s.

EVENT 8. (Racing singles, 500 c.c.; time only.)

*H. C. Newman (3½ Ivy-Precision)	40s.
H. Reed (3½ Dot)	42⅖s.
F. J. Tanner (3½ Triumph)	43⅖s.

EVENT 9. (Amateur singles, 500 c.c.; twins, 650 c.c.)



V. Taylor (3½ Rudge)	42⅕s.
E. Kickham (2¾ Douglas)	42⅖s.
H. C. Adams (3½ Triumph)	48⅖s.

* Fastest time of day.

Mrs. Simpson (3½ h.p. Ladies' Rudge) rounding the first bend after the start.

MAGNETIC SPEEDOMETERS

MOTOR CYCLE FITTED WITH STEWART SPEEDOMETERS, BOTH FRONT AND BACK WHEEL.

The BEST Speedometer at the LOWEST PRICE.

You can pay more, but you cannot get more.

Stewart Speedometers are made by skilled mechanics, the costliest materials, in the largest and best equipped speedometer factory in the world.

During the last three years, the average output from our factory has been **1,000 Speedometers per day,** and that is the sole reason for their low price. If we didn't sell so many we should have to charge more for them.

There are more Stewart Speedometers in use than all other makes combined —that's a good recommendation.

RACING AT PORTMARNOCK.

RACING AT PORTMARNOCK. Start of the four miles scratch race. F. J. Walker (3½ h.p. Rudge), the winner is the second rider from the left.

The second of the Dublin and District Motor Cycle Club's race meetings at Portmarnock Strand took place on Saturday last under very agreeable conditions, and with the sands in excellent order. The straightaway mile was won by P. J. Brady, on a 3½ h.p. Rudge, from T. E. Greene, similarly mounted. F. J. Walker had his Rudge tuned to perfection, and in the four miles scratch race for machines of unlimited capacity he beat the winner of the first race very easily, and also won the thirty miles handicap from the 1m. 20s. mark by over half a mile. Walker did the four miles in 4m. 38⅗s., and the thirty miles in 38m. 59⅘s.; which must be regarded as very fast times, bearing in mind that the races were run over an out and home course of a mile, with a turn at each end. Results:

Mile scratch (under 520 c.c.)—1, P. J. Brady (3½ h.p. Rudge); 2, T. E. Greene (3½ h.p. Rudge); 3, T. J. Dunphy (3½ h.p. Triumph). Won by 150 yards; 100 yards between second and third.

Four miles scratch (unlimited horse-power).—1, F. J. Walker (3½ h.p. Rudge); 2, P. J. Brady (3½ h.p. Rudge); 3, T. E. Greene (3½ h.p. Rudge). Won easily; a good third.

Thirty miles handicap (unlimited horse-power).—1, F. J. Walker (3½ h.p. Rudge), 1m. 20s. start; 2, P. J. Brady (3½ h.p. Rudge), 20s.; 3, J. J Parrell (2¾ h.p. twin Humber), 9m.

COVENTRY MOTORISTS v. BOY SCOUTS.

The manœuvres in connection with the above event, on Saturday, May 18th, will operate in the vicinity of Rugby. The idea of the scheme is that twenty cars and one hundred motor cycles will be used in an attempt to break through a cordon of scouts numbering with officers 250 strong. The motor force will be composed of members of the Coventry and Warwickshire M.C., and the scouts will be drawn from Rugby, Leamington, Warwick, Daventry, Southam, etc. The scouts will occupy the roads, etc., within a six-mile radius drawn from the Clock Tower, Rugby, but will not go outside this line, neither must the motorists attempt to cross it, before 3 p.m.

The rules are that at least five motorists must break through and leave evidence of their having done so at Mr. I. B. Hart-Davies's office, Bank Street, Rugby. A proportion of three to two on either side within twenty yards of each other captures. If the proportion be less than three to two, both retire 100 yards and await reinforcements. Motorists will wear white badges, which will be replaced with red when captured. Scouts will wear uniform, with a white band when captured. The motor force will make use of motor cyclist despatch riders to communicate with their base, *The Midland Daily Telegraph* Offices, Coventry, but must not use telephone or telegraph, which are to be considered as "lines cut." The general rendezvous will be the George Hotel, Rugby, at 5.30 p.m.

THE ARTHUR MOORHOUSE MEMORIAL FUND.

A representative meeting of motor cyclists was held at 89, Pall Mall, S.W., on Monday evening last to consider the question of a memorial to the late A. J. Moorhouse. Mr. Otto Thomas presided. It was agreed that an effort should be made to raise a sufficient sum to endow a bed in the Weybridge Cottage Hospital. This will require about £1,500, and it is hoped that something approaching this sum will be received. Donations should be sent to Mr. T. W. Loughborough, 89, Pall Mall, S.W.

CLUB NEWS.

Foleshill and District M.C.

A reliability trial *via* Kenilworth, Barford, Kineton, Edge Hill, Sunrising Hill, to Stratford-on-Avon, was held on the 27th ult. W. Brandish (Triumph) was first, R. Edgar (Triumph) second, and A. Broad (Triumph) third.

North Middlesex M.C.C.

A speed-judging contest was held on the 21st ult. at Ivinghoe. Each competitor was required to ride a measured course four times at different specified speeds without the aid of watch or speedometer. Results:

		Total error.
1.	H. Boocock (Enfield)	2½s.
2.	T. R. Williams (Premier)	9½s.
3.	P. Dangerfield (Premier)	17½s.

North-west London M.C.C.

The Service Cup has been awarded to the N.W. London club in respect of the Easter inter-club competition to Harrogate and back combined with the hill-climb at Leathley Bank. The individual awards were as follows:

Silver cup.—C. Rose (Rudge) and H. J. Pooley (Premier), total marks lost on the three sections 7, tie for prize for best performance.

Silver medals.—J. W. Thomas (Douglas), 17 marks lost; E. D. Rose (P. and M.), 19 marks lost.

Bronze medal.—P. H. Goddard (Douglas), 109 marks lost.

Flexibility hill-climb, held at Northaw on Saturday, the 20th ult. Results:

Lightweight.—1, G. H. Hollis (Douglas); 2, H. H. Berlandina (Douglas); 3, F. Thomas (Douglas).

For engines less than 500 c.c.—1, E. D. Rose (P. and M.); 2, E. Lawrence (Rudge), fastest single; 3, H. J. Pooley (Premier).

For engines over 500 c.c.—1, F. C. Newbury (6 h.p. Matchless); 2, S. King Smith (5 h.p. Bat).

For passenger machines.—1, C. M. Down (7 h.p. Indian sc.); 2, E. North (3½ h.p. Premier sc.); 3, J. B. Haylor (7 h.p. V.S. sc.)

The side by side racing resulted in wins for Berlandina (Douglas) and Lawrence (Rudge) in their respective classes.

Open passenger machine trial to Coventry and back, May 18th.—Entries are coming in well for this event.

Cardiff M.C.

A hill-climb will be held at Rhubina Hill, near Cardiff, on Saturday the 11th inst., at 2.30 p.m. sharp.

The competition is open to members of the South Wales A.C., Welsh A. and A.C., Newport M.C.C., Aberavon, Port Talbot and District M.C.C., and the Cardiff M.C.

The competition will be divided into eight classes.

Dublin and District M.C.C.

The club held a flying half-mile time trial on a quiet road in the early hours of Thursday morning last. Although the road was slightly uphill, some very fast speeds were attained. Most of the owners of big motor cycles did not compete, and consequently nearly all the motor cycles were of the favourite 3½ h.p. type. The results were as follows:

CLASS A.—Engines under 520 c.c. Mean Time.

1.	R. Dunphy (3½ Triumph)	29.9s.
2.	F. J. Walker (3½ Rudge)	31.3s.
3.	T. E. Greene (3½ Rudge)	31.9s.

CLASS B.—Unlimited.

1.	R. Dunphy (3½ Triumph)	29.8s.
2.	F. J. Walker (3½ Rudge)	30.9s.
3.	T. E. Greene (3½ Rudge)	32.6s.

Streatham and District M.C.C.

A members' hill-climb was held at Titsey Hill on the 27th ult. The formula used was $\frac{W}{C \times T^2}$, as recommended by *The Motor Cycle*, with weight limits for each class. Results:

Class I. To 350 c.c. Weight limit 140 lbs.—1, R. G. Mundy (2½ h.p. Singer); 2, H. G. Ayres (2½ h.p. A.J.S.).

Class II. 450 to 550 c.c. Weight limit 190 lbs.—1, B. Pattison (3½ h.p. Zenith); 2, J. W. Ayres (3½ h.p. Zenith).

Class III. 550 to 1,000 c.c. Weight limit 240 lbs.—1, S. T. Tessier (5 h.p. Bat); 2, H. Hunter (5 h.p. Corah).

Class IV. Any type machine to 500 c.c.—1, W. O. Oldman (3½ h.p. Bat); 2, R. G. Mundy (2½ h.p. Singer).

Class V. Any type machine to 1,000 c.c.—1, S. T. Tessier (5 h.p. Bat); 2, G. F. Hunter (7 h.p. Zenith).

Class VI. Passenger machine.—1, G. F. Hunter (7 h.p. Zenith and sc.); 2, P. H. Garner (8 h.p. Zenith and sc.)

Club News.—

Herts County A. and Ae.C.

The open hill-climb which was arranged to take place on the 4th inst. is cancelled.

Manchester Amateur M.C.C.

This club will hold a 100 miles rel ability trial in Derbyshire on Saturday next. The start will be from headquarters, the George and Dragon Hotel, Cheadle, and the first man will be despatched at 2 p.m. The competition is for a cup offered by Mr. Ed. Broadhead, which is to be competed for in three trials of 100 miles each, of which this is the first.

Western District M.C. (London).

The ladies' day run to Burnham Beeches on the 28th ult. was well supported.

After a picnic lunch, an impromptu breakdown competition was held. The machine on which members tried their skill was E. S. Ritter's 2¾ h.p. Douglas. Four attempts were made, each competitor being allowed five minutes. The only one to succeed in getting the machine to start was W. F. Ritchie, who took 3m. 50s.

Essex M.C.

The above club held a reliability trial of 200 miles in twelve hours, in glorious weather, on the 21st ult.

An out and home course was chosen to King's Lynn and back, *viâ* Stanstead, Cambridge, and Ely. Of eleven starters only one failed to finish, the following qualifying for the club's silver medal: C. F. Michell (3½ P. and M.), A. E. Uffleman (3½ Humber), A. P. Howard (2½ Singer). H. J. Beal (3 N.S.U.), C. Pearson (2¾ Douglas), A. da Silveira (7 Indian), G. E. Revill (6 Zenith), W. C. Hemy (3½ Bradbury and sc.), D. S. Parsons (6 Rex sidette), and D. S. Kapadia (8 Rex-Jap and sc.).

PAPERCHASE.—Members are reminded that the paperchase will take place on Saturday, the 4th inst., starting at headquarters at 3.0 p.m. There will be a supper at the Eagle Hotel afterwards.

Bradford M.C.C.

The fourth annual open climb is to take place on Saturday, the 18th inst. The timing will be by the same accurate electrical apparatus, which proved so satisfactory at last year's climb. The hill chosen (for which permission has been obtained) is Leathley Bank, near Pool, and not far from Otley. The climb will be about threequarters of a mile in length. There will be altogether eleven events, including a class for sidecars and cyclecars. Entry forms and fees must be in the hands of Mr. Sheard Grange, trials hon. sec., Bradford Motor Cycle Club, Albert Buildings, Victoria Square, Bradford, by noon on Tuesday, the 14th inst. The hill is of excellent surface.

Surrey M.C.C.

The results of the members' hill-climb which took place on the 24th ult. are as follows:

CLASS II.

		Time.	Formula.
1.	E. Cox (3½ Zenith-Gradua)	X+19.	... 163
2.	H. Mitchell (3½ Premier)	X+16.2	... 158
3.	F. J. Houghton (3½ Trump-Jap) ...	X+16.2	... 149

CLASS III.

1.	F. W. Barnes (6 Zenith-Gradua) ...	X+ 3.8	... 165
2.	T. G. Meeten (5 Matchless) ...	X+12.6	... 103

CLASS IV.

1.	E. Cox (3½ Zenith-Gradua)	X+16.8	... 171
2.	F. W. Barnes (6 Zenith-Gradua) ...	X+ 3.8	... 165
3.	G. Meredith (3½ Triumph)	X+11.2	... 159

CLASS V.

1.	F. W. Barnes (6 Zenith-Gradua sc.)	X+13.8	... 195
2.	E. Cox (3½ Zenith-Gradua sc.) ...	X+44.	... 173
3.	W. G. Wells (5-6 Clyno sc.) ...	X+52.2	... 111

CLASS VI.

		Time.
1.	F. W. Barnes (6 Zenith-Gradua)	X+ 2.8
2.	T. G. Meeten (5 Matchless)	X+ 5.6
2.	G. Meredith (3½ Triumph)	X+13.6

Class VI. was decided on time. The other classes were decided on the formula: $\frac{W}{c.c. \times (T - \frac{1}{2}t)}$, where t = fastest time of the day.

Motor Cycling Club.

A members' hill-climb will be held on May 11th on a hill to be announced later. All machines must be standard touring types. There will be five classes for motor cycles, one for sidecars, one for cyclecars, and one for cars.

Cumberland County M.C.C.

This club held a reliability trial on the 25th ult. over a distance of eighty-five miles. The course selected was a tour in Eskdale and Dumfriesshire, and included an ascent of the Eskdalemuir Hills, on which the surface is vile. There were three checks on the outward journey and a secret check on the return, and, despite the latter, four members tied for first place, each completing the course without losing a single mark. These were: W. S. Clark (Rover three-speed), R. L. Williamson (T.T. Bat), E. T. Scoll (T.T. Triumph), and W. B. Little (T.T. Rudge).

Crossgates and District M.C.C.

This newly-formed club opened its competition season on Saturday last, with speed trials over a flying half-mile, there being classes for solo and sidecar machines. The handicapping was in the hands of the captain, Mr. J. Stuart-White, and valuable assistance in marshalling and timing was rendered by members of the Leeds Motor Cycle Club. Results:

Solo Class: 1, J. Tattersall (3½ Bradbury), 9s. start, figure of merit 22½; 2, G. Botterill (3½ Triumph), figure of merit 23; 3, S. Kirk (2½ Singer), figure of merit 26.

In the sidecar class, H. Whitfield (3½ Triumph), with 20s. start, just beat F. Crosthwaite, scratch (8 Matchless).

The club will hold a hill-climb next Saturday.

Middlesbrough and District M.C.C.

Brilliant weather favoured the hill-climbing competition held on Saturday, April 20th, at Castleton Bank. A goodly crowd of spectators was present, and some excellent riding was witnessed. The results, which were decided on A.C.U. formula, were as follows:

Class I. (Lightweights not exceeding 140 lbs.).—1, J. Nivens (2¾ h.p. Enfield).

Class II. (Touring Single-cylinder Machines).—1, H. S. Moon (2¾ h.p. New Hudson); 2, C. Smith (3½ h.p. Precision).

Class III. (Twin-cylinder Machines).—1, H. Beckwith (2¾ h.p. Douglas).

Class IV. (Variable Gear and Free Engine Machines).—1, P. Williams (3½ h.p. f.e. Triumph); 2, J. Gilchrist (3½ h.p. Zenith Gradua).

Class V. (Open to any machine).—1, J. Dale (3½ h.p. Triumph); 2, E. Goult, Doncaster (3½ h.p.p Rudge).

Harrogate and District M.C.C.

In fine but dull weather a speed-judging competition was held on the 27th ult. over a give and take course of twenty-two miles, the route having been kept secret and the distance being unknown: 1st, J. J. Day (3½ Bradbury), 2m. 58s. slow; 2nd, E. Maynard (3½ Triumph), 3m. 11s. slow; 3rd, M. Kitchin (3½ New Hudson and sc.), 3m. 46s. slow.

Harrogate and District M.C.C. Speed Judging Competition. Scene at the start. The first motor cyclist in the picture—J. J. Day (3½ h.p. Bradbury)—ultimately proved the winner.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street E.C., and should be accompanied by the writer's full name and address.

Gradient of Knocksaughey Hill.

Sir,—The gradient of Knocksaughey Hill is 1 in 4½, the length only 1,500 yards. The high speed on Easter Monday was due to a very strong gale blowing up the hill.

ALEX. GALBRAITH.

Sir,—Regarding your query as to gradient of Knocksaughey Hill, where the Belfast and District M.C. hill-climb was held on Easter Monday, I know the hill thoroughly, the steepest part being, I feel sure, 1 in 3. As to the average for the whole hill I make it 1 in 4 to 1 in 4½. It is by a long way the steepest hill in this country on a principal road. The information which I have given you is on the authority of a civil engineer. I should say that the top of the hill is most certainly more than 1,000 feet above the sea level.

WM. YORK.

The Tragic Accident at Brooklands.

Sir,—With regard to the tragic accident which occurred at Brooklands on the 20th ult., I must say the various explanations that have been put forward seem to me far from convincing; in fact, there is no explanation at all, except that a thoroughly experienced Brooklands rider lost his balance in the first fifteen minutes of a race.

I think we may take it that Mr. Moorhouse was just before the accident steering with one hand; the other was probably doing something to the carburetter (surely not the hot silencer, as some seem to think). I suggest that, while trying to make an adjustment, the rider's hand came in contact with a high-tension wire terminal. This would fully explain the sudden swerve, which, to the regret of all, he was too late to rectify.

V.A.G.

Clashing of Dates.

Sir,—In your issue of the 25th ult. you publish a letter from Mr. Pooley, in which he claims that his club is not to blame for the clashing of dates. My committee did not draw up their fixtures for this season until late in December, and when drawing up the fixtures had in front of them the list drawn up by other clubs at Olympia, and, as a result, fixed the cyclecar trial for May 18th, which at that time was open except for a speed trial organised by another London club which was not likely to be affected by or to affect the cyclecar trial.

My club applied to the A.C.U. for a permit for an open passenger trial on May 18th as long ago as December 30th, 1911. On March 6th I had a letter from the A.C.U. mentioning certain conditions that would have to be embodied in our rules for a cyclecar trial and promising us a permit on these conditions. Naturally, with this letter in front of them my committee considered the permit as good as granted. On hearing of the North-West London trial for May 18th I was instructed by my committee to write the A.C.U. pointing out that as we were in the field first with the suggestion to hold an open passenger machine trial, it must cancel the North-West London Club's permit.

I have now heard from the A.C.U. that it will not cancel this permit. This is not all, however. I learn this week, for the first time, that a permit has been granted to the Liverpool M.C.C. for an open hill-climb on June 1st, this being the same date as our open hill-climb, which was arranged as long ago as December, and a permit promised on February 10th.

R. VERNON C. BROOK, hon. sec. Birmingham M.C.C.

How to Carry a Camera.

Sir,—I quite agree with your editorial note to the effect that a camera should be carried on the rider's back, and should not in any circumstances be strapped anywhere on the machine. Perhaps it would interest Mr. Wilson to know that I carry my Klimax *under* my macintosh, which I always wear when motoring, and the dark slides (six) are hardly noticeable in an inside pocket of the jacket. I never carry a stand, and can always use the machine or sidecar for time exposures, and have found this method very satisfactory.

F. J. WOOD.

Unofficial Records.

Sir,—I am pleased to find, according to your leaderette in last week's issue, that these unsatisfactory unofficial trials are to be discountenanced by the powers that be. Last year I called attention in your columns to the unsatisfactory nature of these unofficial trials, only to raise the wrath of certain riders, who concluded, erroneously, that I deprecated the sporting phase of such rides, when, in reality, I made it clear that I admired the ride, as a ride, but in the interests of prospective purchasers of machines condemned the "bunkum" with which such rides abounded in respect of reliability, since there was no method of making the general public cognisant of the repairs and adjustments needed, how many times belts, etc., were attended to, petrol consumed, and so on. One day we shall doubtless see the A.C.U. "observing" trials, like the R.A.C. in the car world. However, it is some satisfaction to have my views of last year vindicated.

HARRY P. BELL.

MOBILISATION DAY AT DAVENTRY.

General Thorneycroft chatting with a group of the Legion of Motor Cyclists at Daventry (see page 483).

Wanted, a Hub Cone Locking Device.

Sir,—I was rather surprised to notice "Ixion's" remarks regarding the necessity for a new hub cone lock. On my Premier, which is a 1910, the usual loose cone is screwed into position, after which a D washer is placed up to same, the spindle having a flat to accommodate this, and then a further locking cone is screwed up against the washer. In taking wheel in and out of the forks, the adjustment is not interfered with. D. RICHARDSON.

Are Open Hill-climbs being Overdone?

Sir,—Of what use are the present motor cycle hill-climbs? Do the trade riders really care for them? I have attended some of the big hill-climbs, and I always come away with a feeling of disgust that such competitions are allowed on what are often extremely dangerous hills, dangerous not only for the competitor, but also for the spectator. Each week one sees one or two poor trade riders have bad spills. Does it do any good to the industry? As far as I can see it is breeding a type of machine and man that are not wanted on the road.

One has to go far to find a hill that is a real test for the modern motor cycle, and surely the hill-climbs at present become a farce as such, and merely a speed test over a tricky course for those riders who care to risk their necks.

The Royal Automobile Club has suppressed the open car hill-climb on the road, and, if it does its duty, will put a stop to the present motor cycle hill-climbs that are often run with poor organisation on dangerous hills where high speed are attained. ERIC W. WALFORD.

The Trade and the T.T.

Sir,—I should like to write a few words against the attitude which has been taken up by the maufacturers towards the T.T. Races. Now, it must be fairly evident to the majority of motor cyclists that the Tourist Trophy Races have done an incalculable amount of good to motor cycles, and as the motor cycle of to-day is by no means perfect, why do the makers of present day motor cycles make this unwise boycott? I notice, moreover, that the firms who were in favour of the bond being abolished are firms who have benefited enormously by their racing experience and enterprise, and this leads one to the conclusion that other makers are afraid of risking their new features, the whole machines for that matter, to this rigorous test.

On the other hand, I notice that the cause of the formation of this bond is that manufacturers do not wish to spoil amateurs' sport by entering their trade machines and riders.

If this be so, how is it that firms send specially picked machines and riders to open hill-climbs week after week practically to sweep the board?

Surely this attitude is scarcely consistent.

One can see in the machines made by makers who have had a great deal of racing experience the results of this experience.

One has only to inspect the Matchless, Scott, Triumph, and Rudge machines to prove this, and as an admirer (nothing more) of these machines, I can see on every hand where racing experience has been incorporated, and, I think, the above firms will admit that their experience on track and road has been invaluable. This race has been the means—no other race could be so exacting—of giving us engines reliable and efficient, good, sound, strong, and serviceable fittings, and, of late years, the variable gear. This latter part needs more and more perfecting, for it is scarcely in its ideal form on any motor cycle at present. Freak hill-climbs serve no useful purpose, save that of enhancing the driver's reputation. Short spurts with "competition" engines on a short gradient of 1 in 10 serve the only purpose of providing a spectacle for onlookers; the majority of reliability trials only serve to show how accurately a man can gauge his speed between controls, so I think that the Tourist Trophy Races stand out as the supreme test for a motor cycle—a test that all makers are not willing to subject their machines to. I only hope that these manufacturers who submit their machines to the great test will receive their due reward, and that other makers will lose owing to their efforts to produce a stagnation in the trade. Distinct departures from standard are now almost a rarity, so let us have the T.T. Races to encourage and help the enterprising manufacturers. MERE RIDER.

Sidecars and Single-cylinder Engines.

Sir,—Scarcely a week goes by without some of your correspondents enquiring whether a 3½ h.p. sidecar combination is really satisfactory. I think it would interest novices or hesitating purchasers to know another novice's experience. Mine is a 3½ h.p. 1912 New Hudson, with Millford sidecar, having extra seat for child. This machine was delivered at the end of February, and since then has been driven just under 1,000 miles in journeys varying from thirty to sixty miles, the petrol consumption being rather over 75 miles per gallon. As regards trouble, though almost a novice, I have had very little—the belt pulled through in 208 miles (a Dunlop 1in.), both exhaust and inlet valves springs broke (cause unknown) during the next 100 miles, and then the exhaust valve head smashed, probably, I am told, owing to my using a spring of wrong strength whilst waiting for the manufacturers' replacement. The tyres (Dunlops) have given no trouble, though they have had rough usage. The worst hills round here ("flat" Essex has some hills, *e.g.*, Colchester, "Clingoe," etc.) have no terror for the machine, thanks to the Armstrong three-speed gear, which is absolutely satisfactory, and has needed practically no adjustment so far. I write this, as I firmly believe that these minor points are of vital interest to many would-be motorists, as well as

The "family coach" referred to in letter from Leonard Fenn.

old hands. On one occasion alone, doing shopping in a neighbouring town, no less than three absolute strangers, seeing my machine outside shops, approached me with many apologies, followed by many queries as to the machine and gear.

Needless to say I have not the slightest interest in these firms beyond that arising from the satisfaction of ownership of one of their products. I enclose a photograph of my "family coach." I rode exactly as illustrated for a mile or so to test the power of the machine. She ran beautifully, though I did not risk top gear. LEONARD FENN.

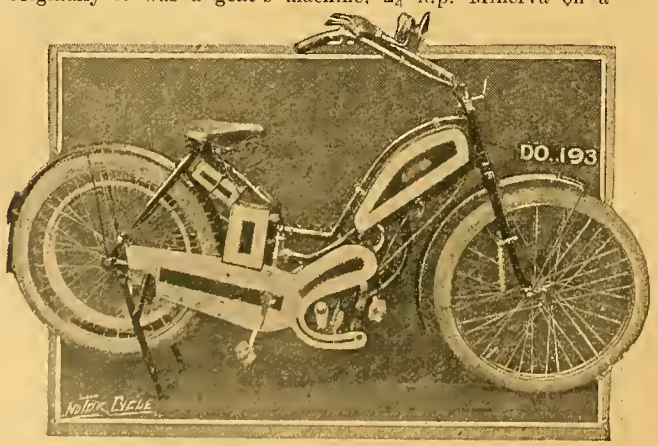
Consumption Comparisons.

Sir,—I was much interested in your recent articles and letters on petrol consumption comparisons, and my opinion is that the heavy comparative consumption of a motor cycle is not due to what the engine itself consumes, but what the carburetter and its connections WASTE (in big letters please). I am a novice, and bought a 5-6 h.p. Rex twin, second-hand, in 1911, which ran about forty-eight miles per gallon when I bought it. Seeing that the engine and bicycle parts were in good condition, I fitted a 1911 B. and B. carburetter, shortened the lift of the inlet valves from $\frac{5}{16}$ to 82 thousandths of an inch, took springs out of the inlet valve that would open with ½ lb. weight, fitted 3¼ lb. springs (I have found the knack of making a spring that will always keep its strength), and large extra air

pipes over both extra air and main inlets pointing upwards.

The reason for being pointed upwards was that petrol vapour, being heavier than air, lies in the bottom of the pipes when standing, is drawn into the engine, and makes starting very easy. When the air pipes were fitted I found more extra air could be given, so I fitted a smaller jet, No. 30. As thus fitted I ran 400 miles on three and a half gallons of petrol, 150 miles of this with a 10½ stones passenger on the back. The 400 miles was done from Birmingham to Aberystwyth and back and various trips out every day to Aberayron, Devil's Bridge, and other places, so that, as remarked by Mr. Alex. Rogers, I had some big hills and the roads were not picked.

I may say I always ride with the spark well advanced, throttle nearly closed, and as much extra air as engine will take without misfiring. Average riding speed twenty-five miles per hour, gear 3⅞ to 1, Bosch magneto ignition, fixed engine. The engine thus fitted with small jet is not apparently in racing trim, but I can get the engine running so quickly that it merely hums. No exhaust can be heard; in fact, as fast as I care to ride, as I have only one neck. I cannot give the speed, as I have no speedometer.



It has always been my opinion that the efforts of makers should be in the direction of economical running, as ample power is now got out of the ordinary bicycle engine, and instead of trying to get 10 h.p. out of an engine fitted with bearings that a stationary engine maker would fit to a ½ h.p. engine, the makers should try and improve the running costs. It makes a considerable difference to the pocket in 5,000 miles with petrol at 1s. 6d. per gallon.

The ordinary carburetter appears to waste more petrol than it feeds to the engine, and on all carburetters, if examined round the extra air inlet, evidence can be seen of the wastage, especially if the carburetter be dusty. In a perfect motor cycle not a drop should be wasted or blown out, and, if blown out, should be caught and taken into the engine on the next suction stroke. If Mr. Alex. Rogers will take a little trouble with his power plant, no doubt he will get equally good results, especially keeping his float chamber in order, so that nothing is wasted when standing. It will be seen that with the same engine I improved the running consumption from 48 to over 120 miles per gallon (proof absolutely that petrol was being wasted, not consumed), with better running into the bargain.

ROBERT W. BILL.

Rejuvenating Old Pattern Machines.

Sir,—As regular readers of *The Motor Cycle*, we thought it might interest you to let you see how we have converted an old motor cycle, of which we enclose a photograph. Originally it was a gent's machine, 2¾ h.p. Minerva on a

An old pattern Minerva which has been converted for lady's use.

Chater-Lea frame. This we have cut down and re-assembled as a lady's machine. We may say it runs splendidly. Perhaps this will solve the problem of what to do with the obsolete motor cycles.

BROWN BROS.

Interference with Competitors in the Liverpool A.C.C. Trial.

Sir,—During the Liverpool Auto Cycle Club trial on April 13th it was my duty as a marshal to stop all the competitors at the approach to Cilcain Hill, and to send them up singly.

During my wait there I was approached by the constable placed on the hill and informed that he had heard rumours of a plot by certain members of a chapel congregation in the vicinity to drive a horse and cart down the hill in order to baulk all the competitors on the hill, in spite of the fact that we had made arrangements to send them up separately, to cause no obstruction.

Now a cart did turn up, and got in the way of Miss Baxter and others, and just as it was passing me the driver lashed out with his whip, intentionally striking Mr. Pollard across the shoulders.

I was just going to run after the cart, and obtain the name and address of the driver, when seven or eight competitors turned up, and, as I had no assistance, I was unable to leave my post, but several of the competitors saw the man's action, which I think most dastardly.

My object in writing is that if any reader of your paper who happens to be driving through the district and meets with similar treatment will communicate with me, I will see that the matter is placed in the proper quarter to have a stop put to it.

LIONEL C. BARTON,
Vice-president Liverpool A.C.C.

Washing Shower-proof Overalls.

Sir,—My overalls are dirty, and I should like to know if you or any of your readers have had any experience in washing proofed woven material and the best methods of retaining or regaining the "shower-proof" qualities.

J. L. HOFFMANN.

Deposit in Petrol Tank.

Sir,—I find that after two years' use my petrol tank, made of brass, is lined inside with a fluffy, sticky deposit some of which often clogs the wire gauze of the carburetter. It is no use to swill the tank with paraffin. Swilling it with paraffin and some balls has only removed part of the deposit. Perhaps some of your readers can tell me how I can best remove this objectionable deposit and prevent formation of a new lot.

L. W. J. DEUSS.
Fort Johnston, Nyassaland.

Pillion Seats.

Sir,—I notice with interest a letter from Mr. W. B. Turner supporting the above method of carrying a passenger, and can endorse his remarks *re* safety and comfort of this practice, provided reasonable care is taken to see that the carrier is sufficiently strong, all nuts secure, and tyres and tubes in good order.

I have carried a friend several thousand miles in this manner—our combined weight is twenty-two stones—on a 1910 Triumph with Mabon clutch. My friend sits upon a "Michell" seat, and is perfectly comfortable even on the roughest roads; in fact, I think the spring cushion is more luxurious than the saddle.

We have toured from Wanstead to Wye Valley, South Coast, and East Coast, generally using a gear of about 4½ to 1, and have very rarely come across a hill which the machine would not romp up with its double load.

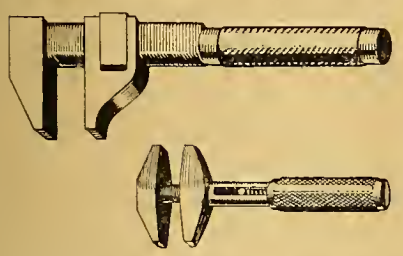
In my experience the steering (even round corners) is improved by the extra weight, which, as Mr. Turner says, has a steadying effect, and it is obvious that as the dead weight of a sidecar is dispensed with, and wind resistance is not increased, this method of passenger carrying puts far less strain upon the engine, and allows a higher average speed than a sidecar combination with the same power.

The Mabon clutch is a great boon, always getting us away without trouble, and proving very useful in traffic, turning in the road, etc.

I had some trouble with rubber belts, but since fitting a "Service" belt all worry has disappeared, except for occasional slip on steep hills.

Tyres have also stood up very well. I am at present using a Clincher Dreadnought on the back, which, after 1,100 miles, shows very little sign of wear.

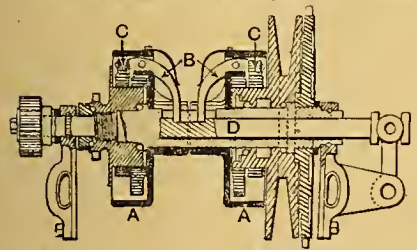
One objection to pillion seats is the fact that the passenger is just in the right position to catch the dust thrown up by the back wheel, but this objection can be washed away with a little soap and water.



ROBERT T. H. ADAMS.

Two New Gears AND Some Accessories.

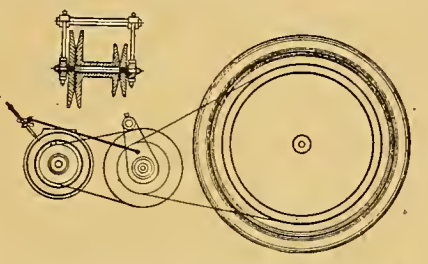
Two Useful Spanners.



Messrs. A. W. Gamage, Ltd., Holborn, E.C., are always to the fore with useful accessories for motor cyclists. The two spanners which we illustrate are decidedly handy and interesting. The bigger of the two is known as the Crawford, and

is provided with a spring and screw controlled movable jaw enabling one to adjust the jaws instantly to any size nut. The smaller one is, owing to the shape and size of the jaws, exceedingly handy for small nuts and inaccessible parts of a machine.

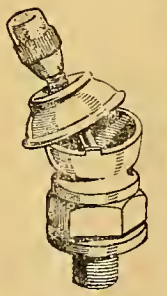
Lincoln-Elk Two-speed Gear.



An interesting counter-shaft two-speed gear has been brought out by Mr. James Kirby for the Lincoln Elk motor cycles. There is an enclosed chain-drive from the engine to the counter-shaft. The counter-shaft runs on ball bearings throughout and carries two contracting clutches C contained in the clutch boxes A and operated by the fingers B. These

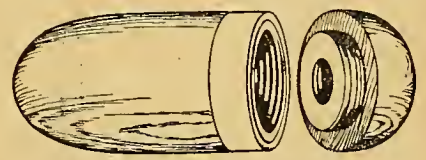
fingers are normally held in the free engine position by leaf springs attached to the clutch-boxes, but are caused to actuate their respective clutches by sliding the centre spindle D. This is done by a change-speed lever fixed on the bottom tube of the frame. In the forward position of the lever, the low gear clutch is engaged, and the final drive is by chain; the middle position gives free engine, and the backward position gives the high gear when the final drive is by belt. An engine clutch, of a similar type to the gear clutches, can be fitted if free engine only be required. Both clutch and two speed have undergone extended road tests before being put on the market, and have proved satisfactory in every way.

The Crofton Hunt Transmission.



This method of varying the gear ratios, which hails from Johannesburg, has enabled the inventor to climb Mulder's Drift Hill on a 3½ h.p. Precision with sidecar and passenger, total weight 614 lbs., a feat previously considered impossible. The gradient varies from 1 in 5 to 1 in 11, and the hill is considered the stiffest in the Transvaal, consequently it will be seen that the performance redounds to the credit of both gear and engine. The ratios obtainable without altering the adjustable pulley are from 4½ to 11 to 1.

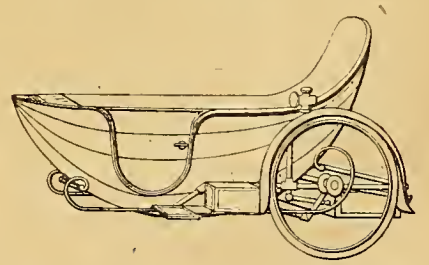
The principle of the gear is already well known to our readers, being similar to the J.A.P., Differo, and others, with the difference that one belt is on each side of the machine. However, we understand that provisional protection has been granted, and that Mr. Crofton is shortly leaving for England to interview manufacturers. The method of operation will be easily seen on reference to the accompanying diagrams.



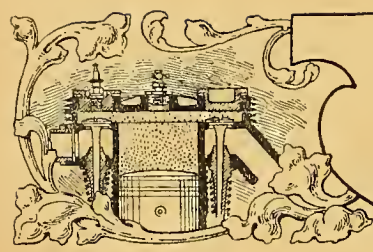
An Ingenious Compression Tap.

Mr. A. C. Davison, the well-known accessory manufacturer, of 163, Arlington Road, Camden Town, N.W., has lately placed on the market an ingenious compression tap which is of quite novel design. The tap consists of two main portions, a spindle forming a ball valve (this spindle is provided with a square situated in its centre and a fibre handle) and a cup, consisting of an upper and detachable portion or lid provided with two recesses on its inner periphery. These engage with two keys on the edge of the cup itself. The keys and slot simply serve to prevent the two from turning. A spring is employed which serves the double purpose of keeping the ball valve close against its seating and pressing the lid against the cup. To open the compression tap it is only necessary to depress the spindle. This releases the ball valve from its seating, and if the spindle be turned and depressed, the square is allowed to pass through the slot in the hole in the lid. The square thus holds the lid close up against the fibre handle, and the spindle can be tipped to one side and sufficient room is left for the injection of petrol, etc. To close the compression tap, it is only necessary to hold the handle between the fingers, turn the lid until the key on the cup engages with the recess in the former, give the handle a half-turn and the spring returns the spindle to its normal position. By means of the spring the ball valve is kept up against the seating, and there should be no possibility of leakage. It possesses the advantage of being neat, dust-proof, and compression tight.

A Neat Plug Case.

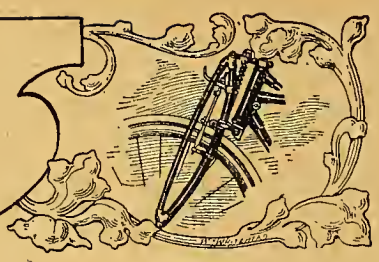


Mr. Parnaby, 319, Fletcher Road, Preston, is making a speciality of a neat sparking plug case, an exceedingly useful accessory made of turned wood. It is adapted to take plugs of almost any



size, and ensures them being carried safely and being kept clean. Such an accessory should find a place in every motor cyclist's tool bag.

A Dropped Frame Sidecar.



A new boat-shape sidecar is being introduced by Messrs. W. Hastings and Co., motor engineers, Huddersfield. One tube of the dropped frame is beneath the axle, to this is attached the diagonal

stay to the saddle pin, giving great rigidity. A six inch car mudguard is fitted with footboard on which is placed a small locker to contain generator or battery. The body is of reed cane sprung from three points. There is ample tool and luggage carrying capacity, combined with a pleasing appearance. Our illustration is from a line drawing of the sidecar sent to us by its makers

MAKING THE BEST OF IT.

A TREATISE ON TUNING-UP. By W.G.A.

THERE is no motor user in the world keener than the average motor cyclist in getting the utmost power from a small engine, and it is only fair to say that, generally speaking, there is no one more successful. One and all, from him who bestrides a 1912 T.T. model, down to the humble follower of the sport who jogs along on an antediluvian 1¼ h.p., are actuated by the same desire, that of wanting a little more power out of the engine, and many and various are the ways in which they set about this business. There are several methods of tuning-up an engine, and these may be divided into two classes, first, that which requires mechanical alteration and re-designing of certain parts, and second, that which is obtained by the mere adjustments of existing parts.

Mechanical Alterations.

Than the former there is certainly no more fascinating hobby to those who do not mind having their machine off the road for perhaps a few days at a time, and who likewise possess or have access to workshops in which the necessary machining can be done. To tune an engine in this manner is practically to reconstruct it, all of which requires time, a certain amount of money, and a great deal of knowledge if the results are in any way to be proportional to the outlay of each. To carry out this class of work with any chance of a satisfactory result it is absolutely necessary that the operator be a fairly shrewd engineer, and he would, therefore, require no special hints and tips to guide him on his way.

The second class of tuning-up is one that can be carried out by anyone who uses a little commonsense and possesses enough skill to use the few homely tools which are required.

Adjustments.

Provided the motor cyclist restricts his attention to mere adjustments and very minor alterations, which after all is a fairly wide field of activity, he is at least sure that no lasting harm can be done even should he make some foolish mistake. I have often seen it stated that to encourage amateurs to interfere with their engines is entirely wrong, since makers may be counted upon to have them adjusted to give the best possible results. With this I do not agree. In the first place, there is nothing so informative and useful as the knowledge which can be gained in tuning-up an engine intelligently, and if a reasonable programme of operations be followed nothing but good can result. On the other hand, it is perfectly absurd to suppose that any manufacturer of motor cycle engines, turning them out at a competitive price for the open market, can possibly afford to spend upon each one the time and trouble necessary to bring it up to the very highest pitch of efficiency. The designer sets himself a certain minimum limit of power output for each type of engine, and as a rule no engine leaves the works until it has passed this standard. At the same time, every engine maker knows that, by some happy chance, an occasional engine comes along, which, though apparently exactly similar to all the others, gives under test a very notable increase of power.

Beyond a certain point, the adjustments required for improvement and efficiency become very very fine indeed, and these occasional super-engines may be considered to take advantage of minute differences occasioned in course of machining. Whilst one would not be so bold as to say that equally good results

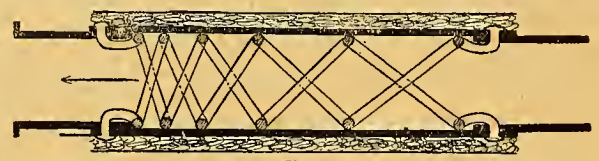


Fig. 1.

could be obtained out of any other engine, provided sufficient pains were taken upon it, this much at least is absolutely certain, that the average engine, as turned out from the factory, is always capable of a certain amount of improvement.

Variation of Engines.

The amount of this improvement is, however, a varying quantity, for it is well known both in locomotive, motor car, or, indeed, any other engineering practice, that even when micrometrical measurements show that two engines are as far as humanly possible absolutely similar in all respects, yet there is always some almost psychological difference which may cause a marked variation in their behaviour. This is due to some very slight differences in the composition and "state" of the metals used, which differences are, of course, quite beyond deliberate practical control. This fact need not, however, worry the motor cyclist, for no one can possibly do *more* than get the highest *possible* results, and, if the fates have willed that his engine must at least be slightly on the inefficient side, he is not to blame. He has done his work when he has reached his limit.

The tuning-up, which can be done by mere adjustment of an engine, offers a sufficiently wide field for experiment for the most aspiring amateur record breaker, and this field may be classified as follows:

1. Carburation.
2. Ignition.
3. Compression.
4. Valve setting.
5. Gear ratio.
6. Silencer.

It is, perhaps, a little too much to say that they are all equally important, but it is certainly sure that they are far more equally so than has been imagined. For instance, how few give more than the scantiest attention to gear ratio. Yet, if the very best results are to be obtained, this must be adjusted to something more than one place of decimals, but it is rarely indicated to more than the nearest half, that is to say, the rider will only know that it is somewhere between perhaps four and four and a half to one. If there is one section, however, which is more important than any of the rest, it is the carburetter, for there is no doubt that the mean effective pressure upon the piston, or in other words, the power of the engine is more dependent upon the heat value of the mixture supplied than upon any other factor.

Carburation.

The average carburetter is open to improvement, principally in the manner in which the petrol is sprayed, and also in the lengths of air inlet and mixture inlet pipes. There is not the slightest doubt in my mind that the best of spray carburetters do allow the liquid petrol to pass into the engine, with the result that at the moment of combustion the gas is divided into a number of regions of varying mixture. The result is that in many of these, incomplete combustion takes place with a consequent increase in fuel consumption and a decrease in engine efficiency, and increase of carbon deposit in cylinder head. The more uniform and homogeneous is the mixture supplied to the engine the better the result, and, therefore, no pains should be spared to increase the vaporising qualities of the carburetter.

In this respect more can be done with the inlet pipe than many people imagine. In the ordinary machine the inlet pipe is practically absent, as the carburetter is generally clamped direct on to the cylinder. One reason why a longer inlet pipe is not used is that the mixture would be cooled thereby, also it is desirable that the carburetter should be kept reasonably warm. So far as vaporisation is concerned, a tolerably long inlet pipe is a great advantage; in fact, the longer the better, always provided that it can be kept warm.

Improving the Inlet Pipe.

This presents very little difficulty, and it is quite safe to say that if an arrange-

Making the Best of It.—

ment be made as described and illustrated herewith, an improvement in efficiency will be obtained.

Fig. 1 shows the idea. First of all, the inlet pipe is enlarged by means of an

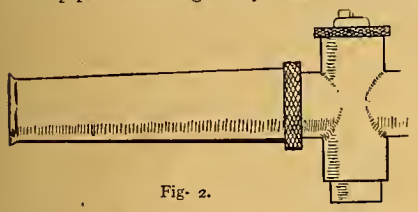

Fig. 2.

external liner as shown, and inside this a length of thick copper wire, wound into the form of a quick-pitch screw, is placed, the ends being passed through holes in the tube at each end and riveted over to prevent it coming loose. Round the outside of the inlet pipe is a wrapping of asbestos string, over which can be slipped a piece of thin brass Treblett tube. The length of the inlet pipe may be experimented with, but 6in. is generally about the best length. In the sketch *two* copper helices of decreasing pitch are shown, but three or four may be experimented with. The function of this device is two-fold, firstly, to assist in keeping the inlet pipe hot by conduction from the engine, and secondly, to increase the relative distance through which the mixture has to pass, and so increase the amount of heat which it can take up from the internal surface of the inlet pipe. It is true that the gas is given, to a certain extent, a whirling action, but this is, in itself, I think, a matter of no great importance. The asbestos string is, of course, simply to keep the heat in.

I have found this device of real value, and it will be recollected that an exactly similar arrangement, though without the asbestos lagging, is used on the inlet pipes of the Scott two-stroke engines, and on these it has clearly proved its worth.

The Long Inlet Pipe.

A fairly long air inlet pipe to the carburetter is desirable. I notice that when this idea is being discussed it is always regarded in an entirely wrong light. The idea is, according to most people, that the momentum of the air inside the tube helps to pump more gas into the cylinder than would otherwise get through. This, in my opinion, is an entirely fallacious explanation, because one can only gain from this momentum a little less than one loses in accelerating the volume of gas, and hence the device could only be of service if the inlet valve were caused to open much earlier than usual. The real value of the device comes in, not when the machine is running at a uniform speed, but when it is being accelerated.

Assuming that before the acceleration takes place the mixture is correct, then the petrol passing through the jet and the air passing round it, are flowing at definite speeds. Now, the inertia of the petrol is considerably greater than that of the air, and, accordingly, when the throttle is opened the air increases considerably in velocity almost immediately, whilst the petrol does so more slowly. This means that the mixture is weakened precisely when it is most required to be enriched. Now, by adding a long air intake tube, opening of the throttle has to accelerate the whole column of air, and, of course, the longer this is the greater is the inertia of it. If the correct length be found, then, when the throttle is opened, both the petrol jet and the air flow will accelerate to the increased speed in the same time, and the mixture will, therefore, remain of a constant quality. An even better effect can be obtained by so proportioning the length of the air intake tube that the inertia of the air becomes greater than that of the petrol, and in this case, when the throttle is opened for acceleration, the engine induces a mixture which is slightly richer than usual. By this means the utmost degree of acceleration can be obtained. The length of this intake pipe varies with the dimensions of the engine, its ordinary running, and the design of the carburetter, and it is, therefore, next to impossible to calculate the best possible dimensions. This can only be arrived at by experiment.

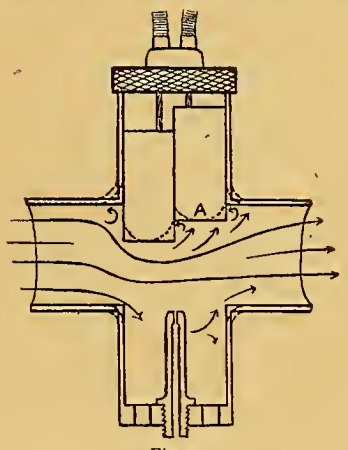

Fig. 3.

I believe that the best possible shape for this tube would be as shown in fig. 2. The tube is perfectly straight, but very slightly tapered towards its mouth where it is turned over a little, the area at the mouth being equal to the area of the air orifice.

Motor cycle carburetters are not, as a rule, distinguished by great perfection of design, and this is not surprising, considering the price at which they have to be turned out. They are, in fact, only really efficient when the throttle is wide open and the induced gas takes a straight-through course right across the jet. When the throttle is half opened the gas has to pass a sharp cornered constriction somewhat as shown in fig. 3, which gives rise to a great many eddy currents as indicated in the sketch. The formation of these leads to a decrease in volumetric efficiency of the engine, that is to say, on its induction stroke it does not get as much gas as it ought to.

Some improvement can be gained by rounding off the corners of the two slides as shown by dotted lines in the figure, and also by rounding off the edges at the junction of the vertical tube and the horizontal one. It must also be pointed out that when a solution of petrol vapour and air meets, in its flow, what is known as a "surface of discontinuity," such as is shown in fig. 3 at A, the velocity of the gas in this region at once drops very rapidly, with the result that the petrol has a tendency to come out of solution and deposit itself in liquid form on the wall of the carburetter, giving rise in doing so to a mixture which is not uniform. This is best stopped by removing the likelihood of such surface of discontinuity forming, in lieu of which the next best cure is to warm the carburetter so as to enhance the vaporisation of the spirit.

Variable Jets.

Since the engine is obviously most efficient when working at full throttle, in which case, of course, the compression is at its highest, and the carburetter behaves best, it is important to have a jet which is exactly the right size, and there is no doubt in the writer's mind that if this end is to be accomplished properly the only means of doing so is to have a jet which is mechanically variable without dismounting the rest of the carburetter. Different sized jets may, of course, be tried and the results with each noted, but the probability is that the best results would be given by a jet of intermediate size, which, of course, it is not always possible to obtain. In a good many carburetters, however, there is no difficulty, or, at all events, very little in fixing up a mechanically variable jet.

A good type of such a device is that shown in the sketch. Underneath the jet support is sweated a small brass collar, which is tapped with a fine thread. Needless to say the drilling is done from the top so as to ensure the lower hole being in register with the upper one, in the latter of which the jet is screwed as shown. A plug to fit the tapped hole is now made, and in this is sweated an ordinary bright brass pin with the head removed. A needle can also be used, but it is likely to get rusty. The length of the pin is made so that it is just clear of the actual jet orifice when the lever, which is attached to the plug, is in a normal position. On screwing up the latter the pin enters the jet, and, of course, slightly reduces it in area to any desired extent. For experimental purposes a fairly large jet is used, and the orifice reduced to that at which the

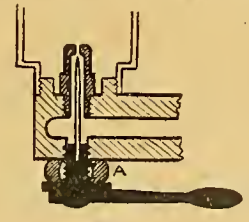

Fig. 4.

best results are obtained. The position of the lever can then be noted so that it can always be returned to the same place. A small section of stiff rubber tube, placed as shown at A in fig. 4, serves to prevent vibration from turning the lever round and also any leakage in petrol.

Needless to say the threads of the plugs should be as good a fit as can be made. A well-made electric binding-screw can easily be converted into a plug and into a collar, care being taken as before to line up the holes correctly.

(To be continued.)

Trade Announcements.

Kemp's Vulcanising Co., 19, Hardman Street, Manchester, have been appointed wholesale stockists for Gaulois and Hutchinson tyres.

Change of Address.

In consequence of largely increasing business, the Service Co., Ltd., have been compelled to remove their pedal cycle department to 302, High Holborn. Extensive alterations are being made at 292 and 293, High Holborn, to give greater accommodation for motor cycles.

Lightweights as Aids to Other Sports.

The 2 h.p. Humber lightweight introduced eighteen months ago is now, we understand, selling in large quantities. This popular model is admirably adapted for the use of those persons indulging in golf, tennis, cricket, etc., enabling them to reach and return from their venue with the greatest of ease and a minimum of trouble. The figure at which this machine is now retailing is a very low one indeed, considering its efficiency.

Prevention Better than Cure.

Prevention is better than cure, but often it is easier to cure than to prevent. For instance, it is not easy to prevent motor cycle tyres leaking through punctures. The Self-sealing Rubber Co.'s air tubes, however, render all ordinary small punctures made by thorns, pins, and nails absolutely harmless, the layer of rubber in compression instantaneously and permanently closing the puncture made in the tube.

Renovating Rusty Cylinders.

Mr. P. E. Massey, of Alderley Edge, has submitted us a sample of his Pem cylinder black which we have used for renovating the appearance of a somewhat rusted cylinder with complete satisfaction. The only possibility of bad results lies in careless cleaning of the radiators. If the cylinder be carefully purified of dirt and oil, and a little Pem be thinned down with petrol or turpentine and applied with a brush, the resulting effect is quite satisfactory, and the hue and surface procured are reminiscent of a clean iron casting.

SPARKLETS

Silencer Test.

Messrs. J. C. Lyell and Co., Ltd., 113, Great Portland Street, London, W., the makers of the Clair silencer, are naturally rather disappointed at the cancelling of the M.C.C. silencer trial. They had entered a 7-9 h.p. twin fitted with one of their silencers, and will be pleased to demonstrate its silence to any callers.

This piece of flattened metal tubing entered the cover of a motor cycle tyre and embedded itself between the rubber and canvas without puncturing the air tube, until it gradually wore its way through.

Lightweight Deliveries.

The Enfield Cycle Co., Ltd., Redditch, inform us that they have recently enlarged their motor department, and none of our readers who may be contemplating the purchase of a Royal Enfield lightweight need have any doubts as regards the question of delivery.

The Popularity of the Sidecar.

A. L. Middleton and Co., makers of the Middleton sidecars, advise us that, owing to the increase in their business, they have been compelled to take additional premises at 27, Stroud Green Road, Finsbury Park, N.

Hobarts in London.

Norris, Russell and Co. have removed from 45, Hatton Garden, E.C., to a larger building at 6, Great Eastern Street, E.C., where a speciality will be made of Handy Hobarts for which the firm are sole agents for London.

Lubricants for Racing.

One of the latest successes to be credited to Sternol is the dual win by S. T. Tessier in the flying kilometre and the flying mile—Class D, 750 c.c.—at Brooklands on the 20th ult. A great point about this oil is that with it the engine starts quickly from cold.

Three and Four Wheeled Cyclecars.

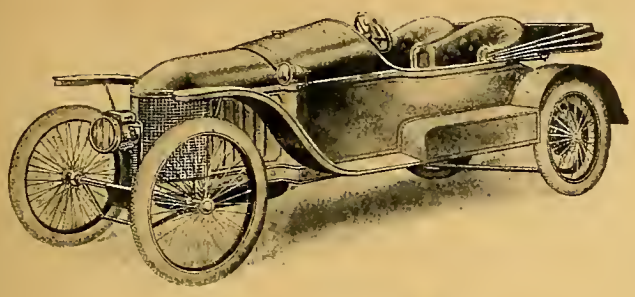
With respect to the discussion that is taking place in our columns on the relative advantages of three and four wheels for cyclecars, it is worthy of note that the G.W.K. four-wheeled cyclecar has been placed in every event in which it has taken part. Among its successes are Streatham and District and Surrey joint trial, silver medal highest award; Herts A.C. reliability trial, gold medal; and Oxford M.C.C. hill-climb, first and second on formula.

Catalogues Received.

The latest catalogue of H. Taylor and Co., 21a, Store Street, Tottenham Court Road, W., is one of the most comprehensive accessory catalogues we have seen this season. A speciality is made of motor cyclists' clothing.

The catalogue issued by Mr. Leoline Edwards, 81, St. Margaret's Road, Twickenham, contains descriptions and illustrations of the Quidos cork stuffed sidecar foot muffs and camping mattresses.

We are in receipt of the latest catalogue published by James Grose, 4, Old Jewry, Cheapside, E.C. This contains every known type of motor cycle accessory; also complete engines.



WESTMORLAND M.C.C. RELIABILITY TRIAL.

Scene at the starting point.

B. Joffreys (3½ h.p. T.T. Triumph) winner of the Quirk Cup.

The BEST MOTOR CYCLE CARBURETTOR IN THE WORLD is the BINKS 2-JET.

THIS IS A BROAD CLAIM, BUT IT IS VERIFIED.

Mr. A. C. ROBBINS writes:

REMARKS.—I have used your Two-jet Carburettor throughout 1911 with eminently satisfactory results, and intend fitting your Two-jet Carburettors on both my 1912 motor cycles. I also used it in the four following events, when I was awarded four medals, viz :—

June 3-5. THE MOTOR CYCLING CLUB'S Run from London to Edinburgh and back, 800 miles.....Gold Medal.

May 9. THE NORTH-WEST LONDON MOTOR CYCLE CLUB'S Run from London to Coventry and back, 215 miles Silver Medal.

June 24. THE ESSEX MOTOR CLUB'S 100 Miles Non-stop, Speed, and Flexibility Trial ..... Gold Medal.

July 1. THE NORTH-WEST LONDON MOTOR CYCLE CLUB'S 14 Hours' Circuit, 240 miles ..... Silver Medal.

If further proof is needed we give the latest of hundreds of complimentary letters.

BRETTARGH HOUSE,
LANCASTER, *April 17th*, 1912.

Dear Sirs,—The carburettor arrived by post this morning, and I put it on at once, and have to-day had the most enjoyable run I have ever had on my 8-h.p. "Matchless." I could not believe a carburettor could make such a difference. It works most beautifully when running slowly and picks up in the most wonderful way. I put 4 jet in the pilot and have kept the 6 in the main jet, and could not wish for better results.

However, I will try various jets, and if I can make an improvement will be more than satisfied. I shall certainly recommend them to my various friends. Believe me, yours faithfully

W. HERBERT SATTERTHWAITE.

The original of this entirely unsolicited Testimonial, together with others, will be shown at the works.

WHY SHOULD NOT YOU IMPROVE THE RUNNING OF YOUR OLD MACHINE, OR INSURE **BETTER** SATISFACTION FROM YOUR NEW ONE, BY FIRMLY INSISTING ON HAVING ONE.

A simple quick Puncture Repair

Read this twice. A cursory glance might fail to adequately convey the simolicity of the Parsons Method of puncture repair.

Parsons Rapid Repair Kit mends punctures in one minute. Four simple operations complete the job. 1. Take out damaged part of tube. 2. Punch hole clean 3. Stretch and insert a plug. 4. Compress—and the repair is made

Once compressed, the plug can never leak or come adrift; neither can it harm the tyre.

Complete Kit, consisting of piercing tool, stretcher, closing pliers, and 12 plugs weighs 1 lb., measures 7in. x 4in. (fits the pocket) and costs

15/-

9, SHOE LANE, FLEET STREET, LONDON, E.C.
Wires: Opificer, London. 'Phone: Holborn 5777.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. ooo, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR BICYCLES FOR SALE.

LIGHTWEIGHT Moto-Reve, 1,000 miles, tyres as new, spares include belt, butted tube, exhaust and inlet valves complete; expert examination; £20.—Hibberd, Sunnyside, Newhall, Burton-on-Trent.

TRIUMPH, 1910, in absolutely perfect condition, little used, almost new, Palmer cord on back, original Clincher on front, usual spares, and spare Dunlop belt, horn, etc.; expert examination; £33/10.—6, Bloxwich Rd., Walsall.

TRIUMPH, Zenith, Singer, Rudge, Enfield, 1912 models, actually in stock. Following second-hands: Triumph T.T., 1911, £38. Triumph free engine, 1910, £39; Triumph standard, 1910, £32; Rudge, 1912, £38; A.J.S., 1911, £21; Bradbury free engine and sidecar, £35.—Oswald Parker, Melbourne, Derby.

THE North Wales Motor Exchange Rhosddu, Wrexham. Tel.: 283.—Careful and immediate attention given to all enquiries. Exchanges a speciality. 1912 F.E. Rudge, Sensprav, £55; 1912 3½h.p. N.S.U. de luxe, £48; 1912 A.J.S., lightweight, model A, purchased off the stand at Olympia, only done 200 miles, £35; 1910 N.S.U. twin lightweight, a beauty, done 500, £27/10; 1908 Triumph, fine mount, £26; 1907 Triumph, just overhauled, £22; 1909 3½h.p. ball bearing Rex, beautiful condition, £25; 1909 5h.p. Rex, 2 speeds, handle starting, fine goer, £30; 1909 3½h.p. Matchless, spring forks, Bosch, bargain, £16; 4½h.p. twin Minerva, modernised, new magneto, h.b.c., just been overhauled, beautiful condition throughout, only wants seeing, £27/10. To beginners, we have some splendid machines, cheap, send for lists.

SIDECARS.—We hold a large stock of these, and can give immediate delivery, excellent value, £5/5; accessories, etc.; let us know what you require.—Above.

SECTION IV.

Nottingham, Lincoln, Leicester, Rutland, Northamptonshire, and Warwickshire.

NEW 7h.p. Indian, 2-speed model; delivery from stock.—Main, 36, Perade, Leamington.

3½h.p. Rex, 1908, Bosch magneto, complete with lamp, horn, and tools; £15.—Main, 36, Parade, Leamington.

3½h.p. Rex, 1909, T.T., complete with lamp, horn, and tools; £20.—Main, 36, Parade, Leamington.

5h.p. Rex, 1909, Roc 2-speed, lamp, horn, etc.; £23.—Main, 36, Parade, Leamington.

ZENITHS, 3½ and 6h.p., in stock for immediate delivery.—Taylor, cycle agent, Kettering.

TRIUMPH, 3½h.p., new August, 1911, spares; accept low price £36.—23a, Coundon Rd., Coventry.

1911½ F.E. Triumph, ridden 2,200 miles, good condition; £45.—Kingston, auctioneer, Spalding.

DOUGLAS, new last September, splendid condition, all spares; £32/10.—Johnson, Accountant, Louth.

1912 Bradbury, 3½h.p., 2 speeds, practically new; offers.—Evans, 62, Northumberland Rd., Coventry.

TRIUMPH, 1909½, just overhauled, faultless, spare cover, belt, usual accessories, lamp; £28.—Eaden, Allesley, Coventry.

1912 Triumphs, Bradburys, Premiers, Humbers, Rudge, in stock.—Clifford's Motories, Eastwood, Notts.

MOTOSACOCHE, 2¼h.p., F.E., 1912 model; delivered Jan. 20th; ridden 500 miles; £32.—Horn, Bourne.

TRIUMPH, 1908, good tyres, tubes, lamp, horn, generator, tools; £24. — Johnson, 30, Long St., Atherstone.

1912 Bradbury, Rudge, B.S.A., Alldays, New Hudson, 2¼h.p. and 3½h.p. 3-speeds in stock.—Blackburn, Spalding.

3½h.p. Brown, magneto, fast and powerful, very good order; £16, or nearest.—5, St. George's Place, Northampton.

2½h.p. Minerva, h.b.c., good climber, low, splendid condition; nearest offer £9/10.—143, Cromwell Rd., Peterborough.

LADY'S and Gent's Clement-Garrards, perfect order; photos; £14 the two.—Stimpson, Broad Walk, Stratford-on-Avon.

PREMIER, 2¼h.p., Armstrong 3 speeds, free engine, only ridden few miles; £41.—Swan, Fieldgate Lawn, Kenilworth.

J.A.P., 2¼h.p., 1912, B. and B., Universal jet, good running order, tyres good; £14. — Oldham, 16, Albert St., Rugby.

MORGAN RUNABOUTS.

MAY DELIVERY.

We have two of these delightful vehicles for May delivery. What offers?

NEW 1912 MACHINES actually in stock.

3½ h.p. 3-speed NEW HUDSON	57 Gns
2¾ h.p. 3-speed NEW HUDSON	47 Gns
3½ h.p. RUDGE, fixed gear	£48 0
3½ h.p. HUMBER, 2-speed model	£52 10
1912 3½ h.p. BRADBURY, single-speed	£46 0
1912 3½ h.p. BRADBURY, 2 speeds	£55 0

SINGLE-CYLINDER REXES.

1910 3½h.p., fine goer	£27 0
1910 3½ h.p., extra good	£28 0
3½ h.p. 1909 Speed King, extra fine	£23 0
3 h.p 1908 Featherweight Rex, Bosch mag.	£17 0

TWIN-CYLINDER REXES.

1906 5-6 h.p. Twin Rex	£16 10
5-6 h.p, Bosch, Lloyd's variable gear	£22 0
7 h.p. de Luxe, 2 speeds, M.O.V.	£48 0
5-6 h.p. de Luxe, 1908, 2-speed model	£28 0
5-6 h.p. de Luxe, 1908, 2 speeds, special	£29 10

OTHER MAKES.

3½ h.p. 1911 PREMIER (new) Millennium 2 speeds. Offers.	
3½ h.p. 1911 PREMIER (new), Armstrong 3 speeds. Offers.	
1910 P. and M., 2 speeds, fine goer	£32 0
1909 MOTO-REVE, twin engine, magneto, Druids	£20 0
1910 8 h.p. BAT, M.O.V., 2 speeds	£45 0
1¾ h.p. WOLF, magneto, spring forks	£15 0
1911 Lady's HOBART, Armstrong 3-speed	£36 0
4½ h.p. N.S.U., Bosch magneto, h.b. control	£21 0
3½ h.p Twin PREMIER, fine machine	£25 0
3 h.p. TRIUMPH, M.O.V., h.b. control	£17 0
1911 2¾ h.p. MOTOSACOCHE, magneto	£27 0
3½ h.p. L.M.C., 1910 model	£25 0
3½ h.p. MINERVA, Bosch magneto, Amac.	£22 0

SIDECAR COMBINATIONS.

8 h.p. BAT, 2 speeds, Millford sidecar	£50 0
5-6 h.p. 2-speed 1908 REX and sidecar	£33 0
7-9 h.p. 2-speed REX and sidecar	£53 0

All fitted with magneto and spring forks.

£3 DOWN SECURES ANY OF THESE. BALANCE 5/- WEEKLY.

3 h.p. MINERVA, vertical, M.O.V.	£12 0
3½ h.p. EXCELSIOR, Amac, h.b. control	£10 0
3 h.p. REX, vertical engine	£9 0
3½ h.p. BROWN Bicar, M.O.V., 26in. wheels	£12 0

£6 DOWN SECURES ANY OF THESE. BALANCE 7/6 WEEKLY.

3 h.p. 1908 REX, Bosch magneto	£17 0
5-6 h.p. Twin REX, spring forks, h.b. control	£16 10
4½ h.p. Twin N.S.U., Bosch magneto	£21 0
Twin-cylinder MOTO-REVE, magneto, Druids	£20 0
3½ h.p. MINERVA, Bosch magneto, M.O.V.	£22 0
1¾ h.p. WOLF, A.J.S. engine, magneto	£15 0

CARS AND TRICARS.

4½ h.p. HUMBER Tricar, 2 speeds, wheel steering	£19 0
5 h.p. HUMBER Car, 2-seater, good goer	£22 0
5 h.p. REXETTE, Oppermann 3 speeds	£18 0
Duocar, Bosch magneto	£45 0

MISCELLANEOUS BARGAINS.

1912 B. and B. Carburetters, variable jets	28/6
1912 B. and B. Carburetters, single jet	27/-
1912 Sensprav Carburetters	28/6
Camel 1in. Rubber Belting per foot	1/3
Frame for vertical engine	7/6
Fulford Castor Wheel Sidecar	£5 0
Fulford Rigid Sidecar, 26in. wheel	£4 10
Montgomery Sidecar, 26in. wheel	£2 10
N.S.U. Sidecar, coach-built, 26in. wheel	£4 10
Rex Pattern Belt Rim Brake (new)	6/6
Lycett's Carrier Toolbags (new)	7/6
Sidecar Lamps, show red light behind	7/6
Trailer, 26in. wheels	25/-
New Toolbags, 9 × 6 × 3½in.	4/6
Sidecar Aprons, green or red, with studs	7/6
New Lycett's Tubular Carriers	4/11
Longuemare Carburetters	5/-

Modern Hill-climbs.

REFERENCE to our correspondence columns will show that the Manufacturers' Union at their meeting last week adopted an important resolution respecting competitions which include hill-climbs. The opinion of the members of the Union is that there are too many of these events which they are practically compelled to support with trade entries, and that instances have occurred where their trade riders have risked life and limb in negotiating dangerous bends on unsuitable hills.

It has been resolved that in future the members of the Union will not support these competitions where the positions are decided on time, and that no prizes will be allotted to the organisers unless they can prove to the satisfaction of the Competitions Committee that proper precautions have been taken to safeguard the riders from accident, either by the selection of a suitable hill without dangerous bends or the adoption of a form of contest which does not necessitate undue risks being taken for the sake of a win.

The resolution not to support hill-climbs which are decided on time might have just as well included similar events where a formula is used to decide the positions, because time enters into the calculation of all formulæ, and a competitor who wants to win on formula has to take just the same risk as one who wishes to win on time.

There is no denial to the fact that great risks attend fast speed up some of the hills selected for hill-climbs, and it is a great wonder that more accidents have not occurred recently; this can only be explained by the good luck and skill of the majority of expert riders.

No sport, however, is without danger, nor would it have any attraction for many if the element of risk were altogether absent. It is inadvisable, however, to court injury by the selection of tortuous hills, but the difficulty of organisers is to find hills steep enough to slow the modern motor bicycle without one or more corners which are either so sharp that the riders have to slow down to such an extent that their engines cannot pick up again or the corner is of a tempting radius which entices them to ride too fast with the hope of getting round, and then accidents occur.

Riders of variably-geared machines have not to take the same risk as those on fixed geared machines, because if the former slow down at a bad corner they have no difficulty in picking up again by using one of the lower ratios, but they are unfairly handicapped because the rider of a fixed gear standard machine seldom uses a standard gear ratio in a hill-climb, but one that is best suited to the particular hill he has got to climb. A solution of the difficulty might therefore be found in fixing a gear ratio for each fixed gear class and making that ratio sufficiently high to prevent dangerous speeds being attained, yet bringing out the capabilities of the machine as a hill-climber on a standard gear and the skill of the rider to a more marked degree.

To our mind the question resolves itself into one query. Are hill-climbs held to prove the best rider or the best machine? The maker sends his men to these events to advertise his machine, the clubman competes to show his skill in driving. It therefore rests with organisers to devise means whereby the best rider and machine may be determined without the risk being more than a fair sporting one.

ALTHOUGH a contemporary takes to itself all of the credit of last week's mobilisation, and refers to the hon. secretary of the Legion of Cyclists in quite a *de haute en bas* manner, the majority of motor cyclists, who are a justice-loving lot, will feel inclined to give credit where credit is due, and incidentally in the same quarter to which the military authorities are also throwing such small crumbs of thanks as can be snatched from the table at Whitehall, viz., to the Legion of Cyclists.

Without a shadow of doubt the Legion is greatly beholden to the papers devoted to the sport—*The Motor Cycle* amongst others—for the publicity given to the event, but after all that is only what could be expected, and what the Legion had a moral and justifiable right to expect. However, I think the matter can wisely be left at that.

The Legion is a self-supporting body which is at present in hands well able to support and look after its prestige. Moreover, it is well deserving of the support of all motor cyclists, and doubtless that support will be given ungrudgingly.

All those who took part in the recent mobilisation received certain papers from the hon. organising secretary setting forth the objects and organisation of the Legion, and since these are of universal interest I have ventured to suggest they might advantageously be reproduced in these pages. I am informed that the press of work on the hon. secretary is enormous, and correspondents are requested to possess their souls in patience. There are some districts in which gentlemen who have an hour or so of spare time in the week would be very welcome if they would undertake the work of organising officer and of recruiting twenty-five motor cyclists in the vicinity.

As to the effect the mobilisation has had upon the authorities it is yet early days in which to venture a prophecy, but the omens are most propitious.

Objects of the Legion of Motor Cyclists.

(1) To organise into corps of twenty-five men (or more) those motor cyclists who, though now unable to join the Territorial Army, would be willing in the event of a foreign invasion to

(Group 1) Enlist in a Territorial Cyclist Battalion,

or (Group 2) Fight as irregular cyclist "Francs Tireurs."

or (Group 3) Serve as mobile town-guard in their own town or village.

(2) To train these men in elementary military knowledge so as to fit them for these duties.

(3) To obtain recognition for the Legion as an authorised force of the Crown.

(4) To assist corps to form voluntary summer encampments.

(5) To stimulate patriotism and recruiting for the Territorial Force both in peace and war.

There is no subscription, but every member who can afford it is expected to become an annual subscriber to the official magazine of the Legion.

Every member must be in possession of the Legion badge, which can be obtained either from his own organising officer or from the hon. secretary (price 1s. 4d. post free). When a corps attains twenty-five members a corps badge will be struck (price 9d.).

Every corps will be placed in touch with the nearest military authority so that members can attend lectures, field days, and instruction in scouting, demolitions, etc. These are not compulsory.

Members of the Territorial Army can become members of the Legion, and are very welcome.

How to Join.

Fill in the application form below and send it to the nearest organising officer, with a stamped and addressed postcard.

Those willing to act as organising officers should apply direct, enclosing a penny stamp, to the hon. secretary of the Legion, Captain A. H. Trapmann, 117, Piccadilly, London, W.

The under-mentioned, having signified their willingness to receive the enrolment of motor cyclists, are appointed organising officers:

LONDON LEGION.—S.E. District: R. D. Brown, 9, Brockley Road, London, S.E. N. District: F. W. King, 148, Culford Road, Southgate Road, London, N. Suburban Districts: G. P. Barham, 347, Kingston Road, Wimbledon.

ESSEX LEGION.—W. T. Austin, 39, Huddart Street, St. Paul's Road, Bow, London, E.

SUFFOLK LEGION.—F. W. Sear, Broughton House, Royston, Herts, and F. Milligan, Laxfield Hall, Framlingham.

NORFOLK LEGION.—P. Crowther, The School, Fulmodestone, Guist, S.O.

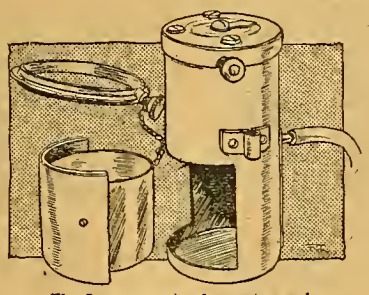
NORTHERN LEGION.—J. Wilson, 101, Sydney Grove, Newcastle-on-Tyne, and L. F. Jones, Wold Newton Vicarage, Hunmanby, R.S.O., Yorks.

SCOTTISH LEGION.—H. A. Ritchie, 38, Falfield Street, Glasgow.

PALATINE LEGION.—G. K. Goulding, Homeleigh, Cromer Road, Aigburth, Liverpool, and M. Oberdorfer, 30, Atwood Road, Didsbury, Manchester.

MIDLAND AND WESTERN LEGION.—A. H. Hill, 31, Colmore Row, Birmingham; J. Fawkner-Tideswell, York House, Old Allesley Road, Coventry; and J. T. Wilkinson, 4, Swanscombe Road, Aylestone Park, Leicester.

APPLICATION FORM.

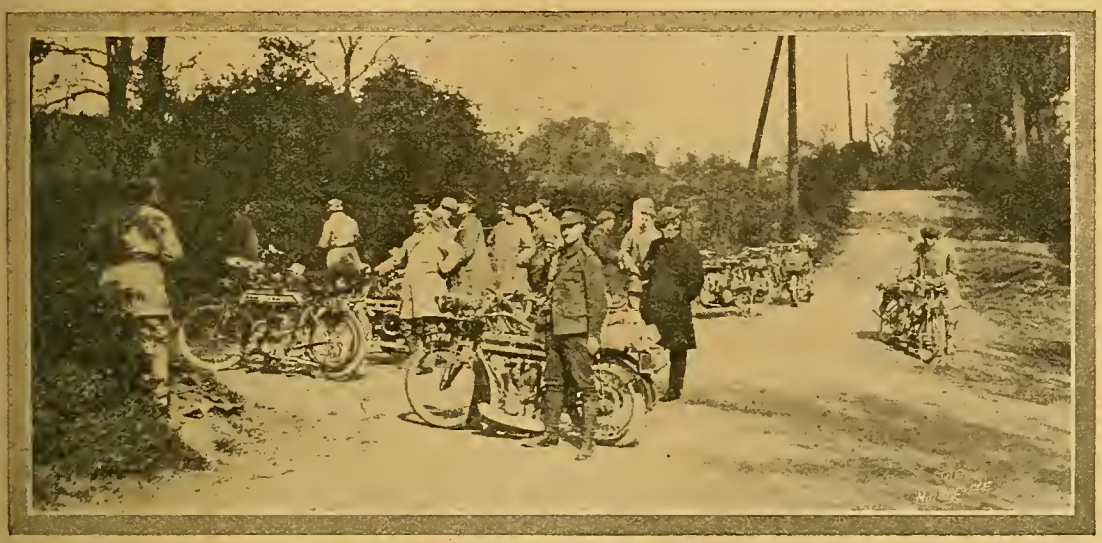


Full Name .....
Full Address .....
In which Group do you wish to serve—1, 2, or 3? .....
Age .....
H.P. of Machine .....
Previous Military Service, if any (Rank, Corps, duration) .....
Will you act as Local Organising Officer? .....

Oath: I, the undersigned, do sincerely promise and swear that I will bear true allegiance to His Majesty King George V., his heirs and successors, and that, in the event of a general mobilisation, I will take up arms and serve him, his heirs and successors, to defend the integrity of Great Britain against foreign invasion.

Date ..... 191... *Signature* .....

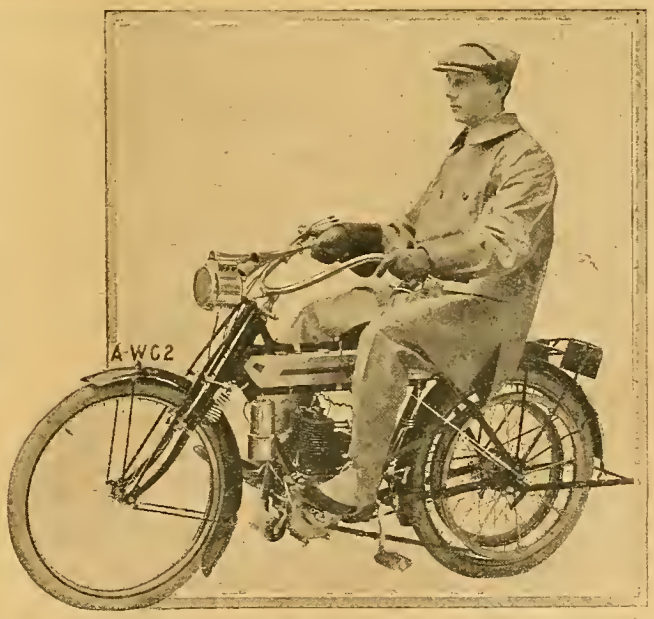
A NEW GENERATOR.



An acetylene generator for motor cycles, which is somewhat of a departure from the usual drip feed type, is the Lux, made by Mr. D. S. Campbell, Critchfield, Bosham, Sussex. The carbide container consists of a tray or drawer, which the illustration renders self-explanatory. That portion of it which comes in contact with the main body of the generator is lined with sheet rubber to render it gas-tight. It is held in position by a ring which encircles it, and is locked by a screw. The most interesting part of the generator is the water drip, which is controlled by a worm operated by a milled nut placed horizontally. The supply of gas is controlled solely by this drip. Usnally the hand on the dial found on the top of the apparatus need only be turned to the first point by means of the milled nut, if a 12½ litre burner be used.

The Lux generator for motor cycle acetylene lamps.

Owing to the delicate control of the water in this generator no more gas need be generated than is consumed, and the pressure may be varied at will. It is advisable to use large uncoated carbide, and the residual ash is, we are assured, always in the form of dust, and is not caked.



It is claimed that almost immediately after the water is turned off the gas ceases to be generated, consequently the generator may be used several times without refilling. No spring is used to keep the carbide in position, there is no central chimney as in most containers, and no filter is used. The generator is simple as to its construction and easy to clean, and a trial of it under road conditions would be interesting. A gas purifier is supplied separately.

MOBILISATION DAY AT DAVENTRY. Scene at the foot of Newnham Hill on which climbing and restarting tests were held during the day.

AN ALL-ROUND SPORTSMAN.

"On the Court and Off." Anthony F. Wilding. Methuen and Co., 5s. The name of Mr. A. F. Wilding is well-known to our readers. Those of them who are lawn tennis players will read his book with no less avidity than those who are interested in the pastime with which this journal deals. Lawn tennis may be said to be the author's first love, but motor cycle riding is his second, and a very good second at that. "The whole secret about practising lawn tennis," says Mr. Wilding, "is to concentrate on the work in hand. Don't wonder why the back cylinder of your motor cycle refuses to fire, or worry about your business." Dealing with his stay in Johannesburg, which, he says, was absolutely delightful, he tells how, "The motor cycle club escorted me over to Pretoria, where we all lunched together and made motor bike speeches to celebrate the occasion. Then we adjourned to the tennis courts and had some good doubles. To finish a fine day we raced back on our machines to Johannesburg." In a special chapter, entitled "On the Road and In the Air," nearly the whole of the matter is devoted to motor bicycle riding and its joys, and very good reading it makes. "For Continental transit, as a medium for getting from one tournament to another, and that often a thousand miles away, I have found the motor cycle invaluable. My friends persist in thinking it has affected my play; on the contrary, I believe it has improved it. At any rate, it has kept me moving in the open, and it has brought me experiences and introduced me to phases of life abroad that I would not have missed for all the championships in the world." The book is well illustrated. Pictures appear of Mr. Wilding on the faithful Bat on which he rode from Land's End to John-o'-Groat's in the A.C.U. six days' trial of 1908, and of Mr. G. W. Hillyard, also of lawn tennis fame, rider of an 8 h.p. Zenith and sidecar.

The 2½ h.p. lightweight Gamage, an up-to-date, well made little machine, fitted with Armstrong three-speed gear, wide mudguards, spacious luggage carrier, and strong stand.

Through the One Day Trial On a Sidecar.

SPACE does not admit of a description of the pleasant but uneventful ride to Oxford. The next morning we started out on the trial in perfect weather. As we rolled along smoothly mile after mile, "we shall all get first-class certificates at this rate," said H. A. Collier. The first part of the route was uneventful, but about 2½ miles from Dursley, after a long climb, the hills of the southern Cotswold district suddenly opened up before us. There was Dursley in the valley with Longdown overlooking it, while to the right rose Frocester and Selsley.

"I am not much used to this 20 mile an hour business," "H.A." confided to me, though from what I saw of his practised handling I should never have known it.

"How does it feel at speeds of 70-90 miles an hour?" I asked.

"I don't know that you feel anything much except the rush of the wind and the vibration; the only thing is to hang on to your machine like mad. It practically wants no steering at those speeds."

We dropped down into Dursley, and then turning eastward towards Uley began to feel the full force of the wind. It made itself especially felt after we had climbed from the valley up a very stiff bit of road from the village of Uley up on to Frocester Hill. It was a pity the weather was so hazy, for on a clear day the view from Frocester is very fine; still, there was little opportunity to admire it as we bumped over the very poor road along the top of the ridge and down into Stroud. Then up again to Painswick and through the beautiful Cranham woods, which in their new spring finery were looking as nearly perfect as anything on this wicked earth. Birdlip has been little used for climbing of late, but it is a very long and trying ascent.

Its length brought even the powerful 8 h.p. engine down on to second gear, though, of course, to a machine like the Matchless, Birdlip presented no real difficulty. But it was up Saintbury Hill that the machine showed at its best. We saw the white flag away in the distance, and rough surface as it was, the throttle was opened out and the ignition advanced, as Collier knows how to do it, and in a few yards we were rocking along at a healthy 45 miles an hour; naturally, it was not long before we flashed by the timekeeper. It took less than no time to climb the steepest part, and, when we had got by the judges, in my innocence I thought we had come to the end of the hill. But "H.A." knew better, and we continued our rapid career over a surface that must have seriously handicapped any less efficient machine. Then came another steep part, and on top of that the flag of the limit. I should not think the machine's speed ever dropped below 20, and by the time we had got to the limiting flag, where the steepness of the hill had somewhat eased off, we must again have been doing about 40 miles an hour. The hill was little more than a dream, it seemed to have been so easily negotiated, yet those who have failed on it or had to walk up it will not say so. After passing through Bourton-on-the-Hill the dust of about a dozen competitors hove in sight in front of us, and for some miles we were compelled to travel in this dust. At last it became so unbearable that six miles or so from Sunrising the machine was slowed down in good earnest. Sunrising was not a timed hill, and though round the bend we came down on to the second speed, it, of coûrse, presented no real difficulties.

H. A. Collier on the 8 h.p. Matchless motor cycle and sidecar which he drove through the A.C.U. one-day trial. This machine secured a first class award.

The worst of travelling on a machine like the 8 h.p. Matchless is that it renders a journey so uneventful. Hills that you have failed on in the old days and pushed up with frightful labour seemed hardly to exist, while even the worst hills in good weather cannot be taken very seriously. Thus it was that from the Edge Hill tower our journey into Oxford, and, indeed, its night continuation up to London once more, were quite without incident. Altogether the experience was most enjoyable.

OCCASIONAL COMMENTS

By "IXION"

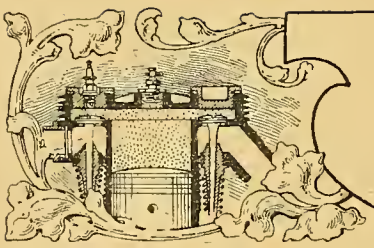
The A.C.U. Six Days' Reliability Trials.

Once again I appeal to the organisers of the A.C.U. reliability trials to penalise bad tyres. I hear rumours that the before breakfast interval for repairs (often utilised for changing tyres) is to be abolished this year, and so far as this affects mechanical troubles, it is all to the good. But it is scarcely fair that good machines should be disqualified or heavily penalised because of bad tyres. Punctures are all in the day's work, and in these days of quick drying solutions and butt-ended tubes, I have no desire to see punctures selected for special allowances; indeed, it is practically impossible to allow for them. But a good machine deserves protection against bad covers. There has never been a Six Days' Trial in which good machines have not been hampered by radically bad covers. The rider cannot protect himself. He is bound to start the week on new covers, and even if he fit covers of a make that he has often tested, he cannot make sure that the particular samples supplied for the trial will not let him down by splitting or bursting.

In previous years there has been some protection. Unless the burst or split occurs in a short control, he could usually struggle on to the end of the day by inserting a gaiter, and on reaching the night stop he could either change a cover overnight under observation without penalty, or utilise the half hour or hour before breakfast next morning in changing the cover. This year, with the stiffening of riding times all round and the (probable) abolition of the morning interval, riders will be at the mercy of tyre makers; and our sole protection will be to ride fast on long controls, and so save half an hour for tyre changes if a cover gives way. This fast riding and the keeping secret of tyre makers' deficiencies are both highly undesirable, so I hope the ingenuity of trials' organisers will be devoted to penalising the tyre maker and not the motor cycle manufacturer.

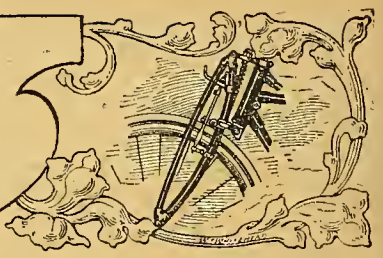
The Design of Three-speed Hubs.

I want to make further reference to a practical point of controversy in the design of three-speed hubs. The direct drive of the Armstrong hub is the second speed; the advantage of this design is that the lowest gear is obtained with only one set of pinions in motion, *i.e.*, with the minimum of friction; its disadvantage is that whenever a very low gear is required, the engine pulley is small, and belt slip is not unlikely. On the Sturmey-Archer hub the direct drive is the top ratio, *i.e.*, the diameter of the engine pulley is the normal ratio. This arrangement permits of a very low bottom ratio, without screwing out the engine pulley to very small diameters, which is an advantage.



On the other hand, the bottom gear is obtained through two trains of pinions, *i.e.*, with additional friction, which must theoretically reduce its efficiency. Two points occur to me which may be kept in mind in studying future designs. The one is that the best place for a variable gear is on a counter-shaft, which enables the primary reduction to be obtained either by a chain or by a large pulley, thus obviating the tendency to increase the liability of belt slip at times when a gripping belt is most urgently required. Probably the future of evolution lies almost exclusively with the counter-shaft gear, which design further retains genuine accessibility for the rear wheel. Last year I could change a rear cover in fifteen minutes; this year (thanks to a hub gear) the same process occupies me threequarters of an hour.

The other point I should respectfully commend to hub specialists is that we should be grateful if they would manufacture their hubs with two sets of ratios. One firm at present sells a special sidecar hub, but it is identical with the solo hub, except that it has more plates in the clutch. Such a set of ratios as 3¾, 5½ (pulley), and 7½, serves admirably for a well-tuned, well-ridden 3½ h.p. solo, but the ratios are not low enough for a go-anywhere sidecar outfit, and if the engine pulley be screwed out far it is too small for sidecar work, and it is odds against the belt holding on a bad climb in dry weather, not to mention wet weather.



The 3¾ ratio is not of much value for sidecar work all the year round; it is often very pleasant in fine weather both on the level and on falling grades, but it could easily be dispensed with altogether. Now a sidecar hub with ratios of, say, 4, 7, and 10 would be infinitely preferable, and while hubs and sidecars are selling so very freely, a separate sidecar hub would repay manufacture, provided its design did not reduce the diameter of the engine pulley unduly.

A group of prominent New South Wales motor cyclists. The photograph was taken on the morning of the racing carnival at which W. Bearpark (marked with an ×) was killed through losing control of his machine. The mounted motor cyclists are W. Hillsden and J. Lucas of New South Wales, who both ride T.T. 3½ h.p. L.M.C. machines.

MAKING THE BEST OF IT.

A TREATISE ON TUNING UP. By W.G.A.

(*Concluded from page* 497.)

Short of rigging up a brake-test, which is quite necessary in tuning up a motor cycle, the next best method of testing the results of various adjustments is to take any even length of level road and time oneself over it, first in one direction and then in the other. This gets rid of variations in wind pressure, which may otherwise enter into calculation. The mean of the two times gives, of course, the nett speed.

Another way of applying tests is to affix the speedometer drive to the back wheel and run the engine for a few seconds on the stand, noting the highest speed which the indicator registers. This is quite a good test in its way for almost any adjustment, but is not calculated to lead to such good results as the previous one. For instance, when running light it is possible to have the spark advanced much further than one could have it when running the engine under load, so that the mere engine speed test is not perfectly reliable.

Twin Engines.

On twin engines some loss in efficiency is often caused by sharp corners in the

Fig. 5.

inlet pipe, especially at the bend at which the T-piece joins it which branches off to the carburetter. As has already been pointed out, it is important that the mixture supplied by the carburetter should not have to make any sharp turns in its course to the engine, because such sharp turns lead to surfaces of discontinuity being set up, in consequence of which the petrol vapour tends to come out of solution and to prevent the mixture from being quite uniform. Fig. 5 shows this idea, the surfaces of discontinuity being indicated by dotted shading.

In some inlet pipes the sharp corners at this point can be removed by filing the T lug, which, of course, has to be unsweated for this purpose. If this cannot be done an arrangement such as that shown in fig. 6 may be used, as by means of subsidiary diagonal tubes the speed of the mixture round the sharp corners is considerably increased. These diagonal tubes should be about ½in. in diameter, and may be sweated and wired on as shown. They do not make a particularly beautiful attachment, but in nearly all cases they do add to efficiency.

Where there is any suspicion of "choking," which is quite common in twin engines, which do not fire at even

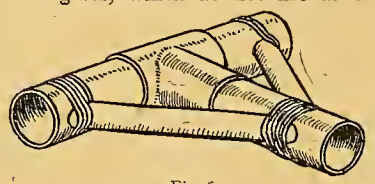


Fig. 6.

intervals, it is quite worth while to make a completely new inlet pipe such as that shown in fig. 7. The writer can testify to the effectiveness of this device, the only objection to which is that it sets the carburetter out a little further away from the cylinders than usual. Twin inlet pipes can, of course, be enlarged and furnished with helical copper heaters as applied to the single-cylinder inlet pipe described last week. Anything that will tend to make the power given off by each cylinder of a twin engine as nearly as possible the same, will inevitably lead to improvement in every respect.

Ignition.

The two matters which give the greatest scope for tuning-up the ignition system are the timing of the magneto armature and the setting of the plug points. A considerable amount of experimenting can also be done with the exact setting of the contact breaker platinums, but as a rule the gauge supplied with magnetos indicates an adjustment for this which one can hardly hope to better. It is not so, however, with the sparking gap of the plug, because the width between the two points for maximum efficiency varies with the speed of the engine and the compression, to say nothing of the make of magneto. For experimental purposes, therefore, a plug should be chosen in which the width of the gap can be adjusted readily, and in this case a single-point type will generally be found most convenient. The next thing to do is to make a gauge as shown in fig. 8. This is constructed of a strip of hard brass about one-eighth in maximum thickness. The length should be 3in., and for the half of this, that is to say, between the two points marked with arrows, the strip should be filed down to an even taper, the thickness of the point A being rather

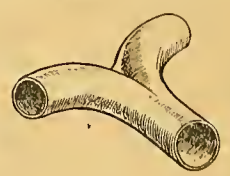

Fig. 7.

less than that of the ordinary magneto contact breaker gauge, viz., about one-third of a millimetre. The gauge so made can be roughly graduated, so that very careful and accurate settings of the pins can be made, their actual distance apart in millimetres or fractions of a millimetre being, of course, quite immaterial.

It is surprising the amount of difference in the running of an engine which can be obtained merely by plug point adjustment, although some engines are more amenable to this treatment than others, especially those in which the compression is not very high. I have also found a marked difference in the gaps which give the best results in engines of exactly the same type, whilst on the last engine I experimented with, a twin, the best possible gap for the front cylinder was decidedly larger than that giving the best results in the back cylinder. This was probably due to the increased wear, due to poor lubrication, on the front cylinder slightly reducing the compression.

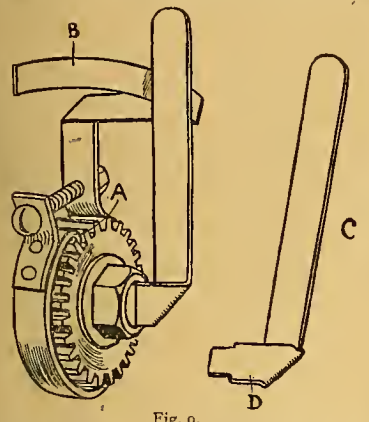
Fig. 8.

Next with regard to the timing of the magneto armature in relation to the engine. It is easy enough to get this *nearly* right, but to get it perfect requires a good deal of manipulation. On some engines provision is made for giving a fine adjustment to the driving sprocket or pinion, but this is the exception rather than the rule. Where none is fitted it is easy to make a little jig which gives remarkably good results and is exceedingly easy to make.

Fig. 9 shows the device as applied to a gear-driven magneto pinion. A strip of brass or steel is bent round in the form shown in the sketch, the internal diameter being the same as that of the pinion carried on the armature-shaft. The end of the strip A is turned sharply inwards and filed until its shape enables it to fit into one of the teeth, which should be marked in some way. The other end of the strip is twisted and bent over as shown, whilst a small piece of brass is sweated to the turned-in end so as to form a clip whereby, with the aid of a $\frac{3}{16}$ nut and bolt, the whole can be clamped tightly on to the pinion. The extended arm B is used as a kind of dial. Into the end of the armature shaft, which in the drawing is shown with its nut, a diametrical nick is cut

Making the Best of It.—

with a fret-saw to the depth of about $\frac{1}{16}$in., or perhaps a little more, and to fit this nick a piece of old hack-saw blade is taken, softened and twisted over as shown at C. The end of it D is



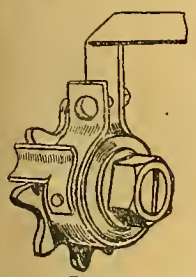


Fig. 9.

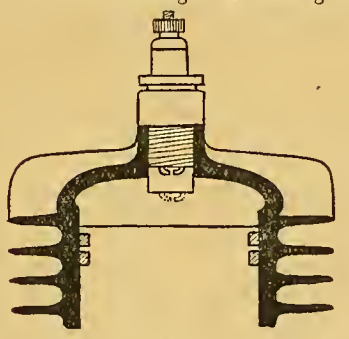
then filed until it is an easy fit into the end of the armature spindle nut, and when this has been done the blade is hardened again.

This simple little device enables the magneto to be timed with extreme accuracy, provided that the pinion or sprocket is not keyed to the armature. If it is the key must be removed. To use the contrivance a dot is made with a centre punch on B exactly opposite the edge of the blade C, when the pinion is in the normal position. This dot forms the starting point for further adjustments, as by making quite rough graduations on the brass arm an extremely fine adjustment can be made on the armature-shaft, using the blade C to set it in position relative to the pinion or chain sprocket. By this means it is possible to get the very best possible timing, and the setting can be done with absolute ease and certainty. The manner in which the device is arranged for a chain sprocket is shown in fig. 10.

Amongst other points which are worth experiment are the position of the plug or plugs in the cylinder and also the depth to which they extend, which is commonly known as the "reach" of the plug. In engines with side-by-side valves only short reach plugs can as a rule be used so as to prevent the likelihood of the inlet valves pushing the points together.

Fig. 10.

In other engines improved running is obtained, as shown in fig. 11, by using a long reach plug in the cylinder head so that the points come below the surface of the combustion head. By this means the inflammation of the mixture is made as rapid as possible, with the result that the engine can be got to run effectively at a higher speed.

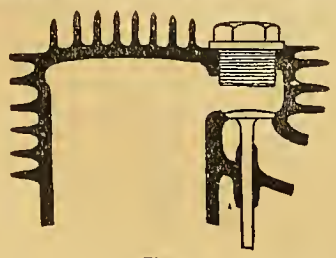


Compression.

The compression ratio of engines is decided upon by their makers with a view to the average work which they will have to perform, and it is, therefore, in most ordinary engines, slightly on the low side, so as to be suitable and comfortable to people who do not want much speed. Where capability of fast work is considered of more importance than a slight decrease of comfort when pottering, and an inability to run evenly at very low speeds, the compression ratio may be slightly increased with good results. In this respect it is hard to lay down any hard and fast rules, as the matter depends so much upon the design of the engine.

With a side-by-side valve arrangement, special valve caps can nearly always be obtained which project further into the cylinder and so decrease the compression space. In some engines they prove an advantage, whereas in others they make little difference. One reason of this is that whilst they tend to increase efficiency by increasing compression, they defeat their own ends by promoting a bad internal form of the combustion chamber as indicated in fig. 12. This is, unfortunately, the only easy way of altering the compression short of having a piece turned off the cylinder flange. It may, however, be *reduced* easily enough by placing packing plates, alternately of sheet iron and oiled brown paper, between the cylinder and the crank chamber.

Valve Setting.

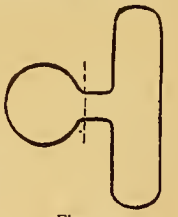


In most motor cycle engines the means allowed for altering the timing and

Fig. 11.

setting of the valves are very limited. The cams are nearly always in one piece with the half time pinions, whilst the timing pinion on the crankshaft is generally keyed or otherwise held immovable in position. This is certainly as well, because it prevents immoderate "playing about." Usually the timing of an engine can be taken as correct if it is set as it was when it leaves the maker's hands. If the machine is second-hand, however, it may easily happen that the previous owner has upset the valve timing.

Once the timing wheels have been marked with a centre punch so that they can always be put back into their original position, it will often pay the tuner-up to try the effect obtained by advancing or retarding them a single tooth, not forgetting that if the exhaust opening is moved it may upset the magneto timing.



The period of opening and closing of valves varies quite considerably with different designs of engine, but the following figures represent an average of fairly high efficiency. The inlet valve should open exactly on the top of the stroke and should close when the crank has passed through an angle of 210°, that is to say the inlet does not close until the compression stroke has started. The firing point should occur, when fully retarded, about 5° before the piston is

Fig. 12.

at the top of the stroke. The exhaust should open about 45° before the end of the explosion stroke, and close slightly after the piston has reached the top of the cylinder.

Those engines which are fitted with adjustable valve tappets lend themselves most readily to precise tuning, as they enable the best possible clearance between the tappet and the valve stem to be arrived at and fixed with great ease. This clearance is a matter of considerable importance, and is best effected by a process of trial and error.

In engines in which there is no provision made for adjusting tappets, wear can only be taken up by lengthening the tappet itself or the valve stem. The latter is the easier. Special thimbles which fit tightly on to the base of the stem, and of various thicknesses, can sometimes be obtained, but in their place quite an easily made little dodge can be used. To construct it one requires three or four different thicknesses of mild steel sheet, which are cut out roughly with the snips and afterwards filed to the shape shown in fig. 13. They are then bent up to the form shown in fig. 14, and applied to the base of the valve stem, as illustrated. The two encircling arms should be bent round a piece of rod *smaller* than the valve stem, so that when applied to the latter they make a thoroughly tight fit. The edge of the valve stem which abuts against the upturned piece should be very slightly rounded off with a file, as shown in the sketch. This prevents the adapter breaking at the corner. By making different thicknesses the valve clearance can be nicely adjusted and the adapters can be slipped on and off.

Fig. 13.

On overhead valve engines in which there is an outside tappet rod the clearance of this should be adjusted *when the engine is hot,* for this reason: The cylinder when running is hot whilst the tappet rod remains practically stone cold, hence the clearance between the tappet and the valve stem increases the hotter the engine gets. When properly adjusted there should be, therefore, practically no clearance at all when the engine is cold. It will, of course, be realised that the smaller the clearance the earlier the valve opens.

Making the Best of It.—

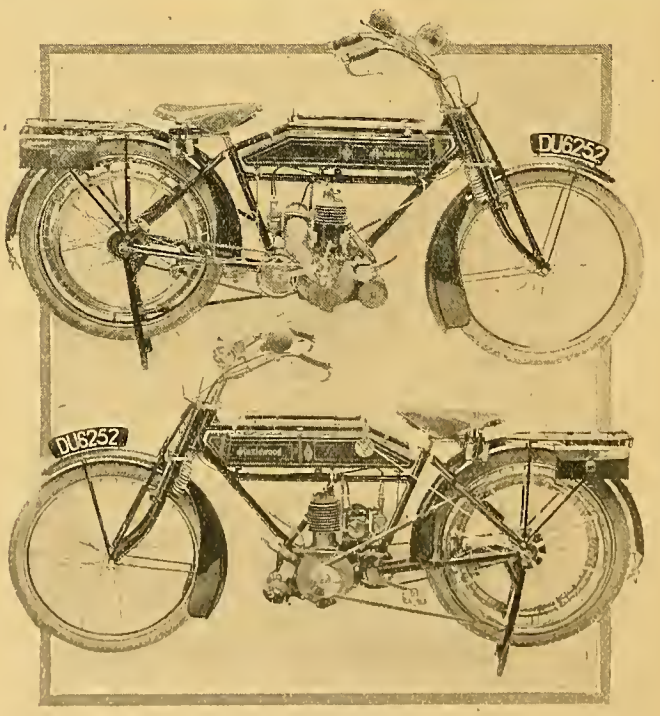
Gear Ratio.

If appearances be not deceptive, the matter of gear ratio is one that, even if properly understood (which it seldom is), never as a rule receives more than scant attention at the hands of the ordinary amateur, as in most cases the deep-rooted fallacy is held that the higher the gear the higher will be the speed of the machine. There never was such a persistent misconception as this, for there is nothing so easy as to overgear a small engine, and it ought to be well known that very frequently to decrease the gear is to increase possible speed, to say nothing of improving hill-climbing abilities, etc. When the machine is running at its highest rate of speed on the road the engine should be turning pretty nearly as fast as its maximum number of revolutions on the stand.

Owing to the fact that the higher the speed of the engine the less becomes its volumetric efficiency—the h.p. curve does not go up proportionately with the revolutions, and it is for this reason that a careful choice of gear ratio is so important. It is not enough roughly to measure the diameter of the engine pulley. To ascertain the gear ratio correctly (and it is well worth while to do so with the utmost exactness) for future adjustments, both the back tyre and the engine pulley should be chalk-marked and the precise number of revolutions and fractions of a revolution made by the engine for one of the back wheel measured. In this matter belt fasteners which allow of two or three different adjustments are very useful.

Fig. 14.

On chain-driven machines the gear ratio cannot be altered with such exactness unless a whole stock of sprockets be invested in. The tuner up should, however, have no difficulty in seeing if the gear is in need of considerable alteration, and if so then the purchase of a single sprocket should be sufficient for improvement. They are, however, not cheap things to buy, so that the chain-drive enthusiast is restricted to other branches for his tuning up.

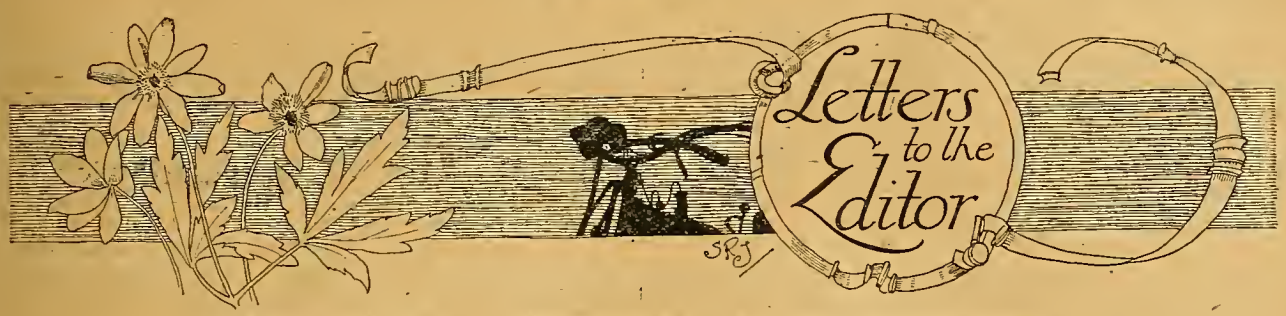


Silencer.

It is generally admitted that motor cycle exhaust boxes (one hesitates to call them "silencers") are not as efficient as they should be, but the point is not generally realised that often a few simple alterations will make them not only quieter, but better from the engine efficiency point of view. In quite a number of silencers the exhaust gases enter a box from which they can only emerge by passing through a number of very small holes. By blowing down the exhaust pipe one can of course detect no suggestion of back pressure in such an arrangement, but it is a very different matter when it comes to gases travelling at exceedingly high velocities. In these circumstances small holes offer a very high degree of resistance. Improvement, however, can sometimes be made by boring out these holes considerably larger and fitting internal baffle plates, the idea being to give the exhaust a fairly free passage, whilst cooling it as much as possible. By this means both increased silence and increased efficiency can often be obtained.

Two up Edge Hill on a Lightweight.

FOR some time past we have been promised a trial of the 2¾ h.p. Hazlewood three-speed geared machine, and quite recently Mr. Hazlewood telephoned us to say that a machine was ready.



First of all we had a good look round and were struck by the excellent finish and attention to detail. Both mudguards are fitted with side flaps, the clutch rod is divided so as to prevent whip, and an excellent leverage is obtained. All control levers come in convenient positions, and almost every nut is castellated and cottered so that there is no chance of its working loose. We were accompanied on our trip to Edge Hill by Mr. Walsgrove, of the Hazlewood firm. The machine we rode was absolutely standard and quite new, but we were astonished at the power developed by the little 70 × 76 mm. engine. At our first attempt at the hill we got up comfortably on the low gear, and at a later attempt came up well on the normal gear of 6¾—1. We then went on to Sunrising and made two good climbs, both on the normal gear. When it is considered that a very short time ago Edge Hill and Sunrising were both considered severe tests for a 3½ h.p. motor cycle, it seems truly wonderful to be able to take a standard 2¾ h.p. machine over both these hills on the normal gear. Not content with this, Mr. Walsgrove suggested that we should come up on his carrier. At the first attempt we failed within about thirty yards of the top, but on slightly lowering the gear sailed over comfortably. Surely this is a magnificent performance for so small an engine. The low gear ratio when carefully checked was just 9—1. The weight of passengers totalled 21 stones odd, and Edge Hill is nearly three quarters of a mile long, having a maximum grade of 1—7, and an approximate average grade of 1—10. On the return journey we were troubled by two punctures, both caused by nails, but otherwise, with the exception of lowering the gear for our attempt with two up, the toolbags remained unopened. The mention of toolbags reminds us of the complete equipment of tools packed neatly in pannier bags, and the 2in. moulded Dunlop tyres supplied with all Hazlewood motor cycles. We are indebted to Mr. Hazlewood for a very pleasant run and an eye-opener as to the capabilities of a modern lightweight.

Two views of the 2¾ Hazlewood, which is fitted with a J.A.P. 70 x 76 mm. engine and Armstrong gear.

Open Hill-climb in Yorkshire.

The Bradford M.C.C. has selected Leathley Bank, near Pool (Otley), for its fourth annual open hill-climb on Saturday week, the 18th inst. There are eight classes on the programme embracing every type of motor cycle from the lightweight to the cyclecar. Stripped machines will be allowed in the racing classes. Electrical timing will be used. A competitor weighing less than 154 lbs. must provide ballast to bring his weight up to this minimum. The Eric S. Myers silver trophy will again be competed for. The annual open reliability trials will take place on Whit Monday and Tuesday, May 27th and 28th, to Edinburgh and back.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street E.C., and should be accompanied by the writer's full name and address.

Inside or Outside Flywheels.

Sir,—I would very much like to know readers' opinions on the following question: How is it that, although internal flywheels are obsolete in aeroplane, car, and motor boat engines, they are still retained on motor cycles? As the owner of a 2¾ h.p. machine with outside flywheel, I should like to point out that it climbs better and will run slower than any other motor cycle I have owned. As this is my fifth machine, I think I should be able to compare the two different types of flywheel. PASSENGER.

Sidecar Taxation in Scotland.

Sir,—I was rather interested in the query signed "Leith" in *The Motor Cycle* of April 25th. Your correspondent is evidently going by what he has heard, and not made enquiries at the revenue offices. I had occasion to fix a sidecar to my machine this week, and not knowing whether I was obliged to pay extra tax or not, I went to tax office in Waterloo Place, Edinburgh, and was most courteously informed that no extra licence was required, as a sidecar made the combination into a tricycle and £1 tax already paid covered bicycle or tricycle. I was further informed that an extra tax was required for a trailer, as this made a four-wheeler. EDINBURGH.

Disqualifications.

Sir,—After reading Mr. H. C. Newman's letter, *re* his disqualification in the touring single-cylinder class at Leathley Bank, one is forced to the conclusion that he has a very real grievance against the officials. The only reason given by them to Mr. Newman, *i.e.*, "that no touring single-cylinder could climb the hill in that time," would be ludicrous, were it not for the fact that he was actually disqualified on that account.

Would it not be advisable, to avoid misunderstanding and to make things quite clear, if the disqualifying officials made public, through *The Motor Cycle*, the actual facts leading up to the disqualification of the Ivy.

As the matter stands it is very unsatisfactory, and is liable to create wrong impressions. "IVEONA."

THREE PARSON BROTHERS WHO MOTOR CYCLE.
Rev. H. Stanley, Rev. Geoffrey, and Rev. P. G. Tibbs. Their mounts are a Triumph, Humber, and Douglas respectively.

Carrying a Camera.

Sir,—In reply to Mr. Gordon M. Wilson's letter published in the last issue, I would strongly recommend him *not* to carry his camera and lens in a box fixed to the top tube of his machine; even if the vibration were not sufficient vitally to harm his camera, it is yet well within the bounds of possibility that the "centring" of his lens might be seriously interfered with. The Ross anastigmats are really first-class lenses in every way, and it therefore behoves the owner of such an instrument to take every care of it and run no unnecessary risks.

I always carry my camera in a leather sling case with the strap passing over my right shoulder and under my left arm. The case contains loaded slides as well, and I have never noticed its presence except when actually needed.

E. G. EVEYARD, S.L.P.S.

Lubrication.

Sir,—I have a small twin, and the oil reservoir and pump are in the rear end of the tank, easily accessible from the saddle. I have removed the check valve and fitted a small tap on the oil pipe to engine, and to this tap I have soldered a thin sheet steel lever about six inches long, coming level with the top of the tank. I have marked on the tank when the tap is closed and when it is open for average running.

The long lever admits of the tap being opened or closed with great nicety, and the engine can be kept running without attention for many miles; the vacuum in the crank case appears to induce the oil, even with an aperture through the tap so small that movement of the pump plunger, when pressed hard, is imperceptible. By opening the tap, a pumpful can be passed through at any time, but in practice I find it quite unnecessary.

On long hills, I move the lever slightly forward until I see smoke at the exhaust, and then put it back to normal. In short, the arrangement seems to meet all requirements, and is so simple that anyone can fit it, and the running position of the long lever is easily found by experiment, once and for all. C.E.

The Holyhead Road at Corwen.

Sir,—Could you spare me a few lines in your paper to vent a complaint and give a warning to other motor cyclists.

It has been my misfortune, with two other friends, to traverse that last ten miles of the Holyhead Road into Corwen from Bettws. I shall not attempt to describe the awful state that this road has been allowed to get into—there is not a language that could do it justice and no imagination that could picture it—one has to go over it to realise how bad a road can be; the horrible gutters and terrible stones that are hidden by water, which in places reaches nearly to the hub of the wheel, form real death-traps. I might state that the damage done to my cycle was badly dented rim, cut tyre, buckled front brake, and broken back stand. I will not worry you with what I think of the powers that be for allowing a main road to get into such a state, but, in conclusion, let me advise any motor cyclist who intends touring North Wales not to touch that first ten miles out of Corwen, for a ploughed field is a paradise to it. H. M. WILLIAMS.

[Readers who wish to avoid this stretch of road on their way to the North Wales coast should travel *via* Ruthin, Denbigh, and St. Asaph.—ED.]

A Sidecar Tip.

Sir,—It may be of some use to the readers of *The Motor Cycle* to know that a two-gallon petrol tin is just the right height to be used as a sidecar stand. As many motor cyclists carry a spare tin with them, they will find it very useful for jacking the sidecar wheel to mend punctures when a sidecar stand is not obtainable.

Personally, I jack my cycle on the front and back stands, and put a petrol tin under the sidecar axle, thereby taking all wheels off the ground when the cycle is to be left unused for any long period. It is a good plan to place a soft rag between the axle and the can to prevent scratching the enamel.

Some people find difficulty in carrying a spare petrol tin on a sidecar. I used to carry it on a platform under the sidecar, but once when I came to require the petrol I found that a hole had been worn in the tin where it came in contact with the sidecar frame. I now fix it on the down slope of the sidecar seat, on the inside, under the passenger's legs, and I find it does not inconvenience the passenger in the least, and is out of the way and does not affect the appearance of the sidecar. R.G.E.

An Amateur Hill-climb.

Sir,—May I through your correspondence columns bring to the notice of amateur riders the open amateur hill-climb that is being organised by the Sutton Coldfield and Mid-Warwickshire A.C. to take place on the 18th inst.?

During the past year or two there have been a large number of complaints from private owners, who ask what chance they have of winning when competing against the trade cracks, such as one meets at every big hill-climb. The sport consequently suffers, as the same small coterie of expert riders are to be met with all over the country, and the prizes usually fall to them.

The Sutton Club, however, has attempted to fill the gap by organising an open hill-climbing competition in which no members of the trade will be eligible to compete. In addition, all amateurs who have won a first prize in any open hill-climb are also barred, and it is hoped that this will have the effect of attracting a large entry from amateurs all over the country.

The usual classes are provided, and good prizes are awarded, and as the climb will be conducted on the "knock-out" principle, where riders race up the hill in pairs, some most attractive and exciting sport is assured.

All particulars can be had from the trials hon. secretary, Mr. James St. John, 33, Fountain Road, Edgbaston.

HOWARD SMITH.

Hon. Sec. Sutton Coldfield and Mid-Warwickshire A.C.

Perished Air Tubes.

Sir,—I have had rubber inner tubes in use and in good condition for five years or longer. I have recently seen a piece of rubber that I played with as a child fifty years ago that still requires an expert and a wetted knife to cut. I believe this was natural rubber, unmanufactured. Oh, for a cover made of that!

I have recently had a tube from one of the best manufacturers that split beyond a mended puncture two days later, for four times in succession, and was as rotten as wet paper. I sent it to the makers for their report upon it. The next day they wrote "that they could find no fault with it."

In the meantime I put one piece of a new tube to soak in petrol and another in mineral naphtha that I used for cleaning the tube and patch before solutioning for patching. They were both as soft as wet paper. My second letter to the makers, explaining that I had found out the cause of the trouble, crossed their reply. In three days the rotten patches that I had soaked, which in the meantime had been exposed to the air, had returned to their natural, strong, and flexible condition.

Therefore the advice to the wise is: Don't use these cleaning mediums unless you give time and opportunity for the rubber to recover from the temporary damage, and remember that, although the outside of tube and patch soon recover, the inner side of the tube requires, for the same effect, that it should be filled with air and emptied many times prior to inflating hard.

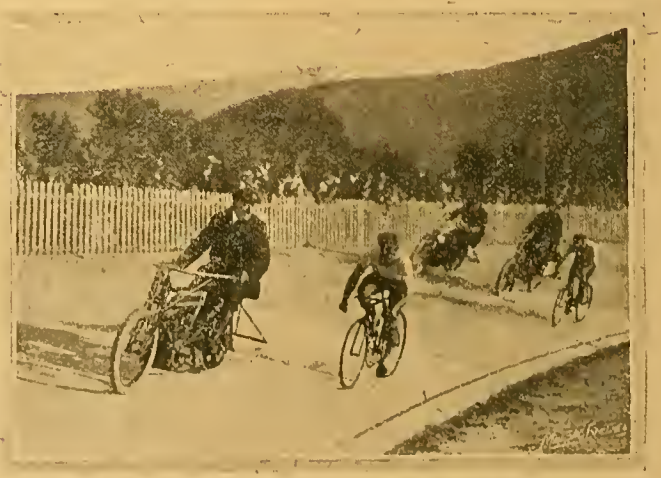
These cleaning mediums enter the tiny puncture easily and run along the inside of the tube. I think this will account for trouble to the tubes of many of your readers.

W. H. ROWE.

Petrol Consumption.

Sir,—The importance of this subject to all motor cyclists is my excuse for asking for the insertion of this letter in your columns, in the hope of gaining some useful information for myself and doubtless many others whose experience coincides with my own.

I have observed that you have several times stated that the popular 3½ h.p. machine should run about one hundred miles to the gallon of petrol. I can only say that neither myself nor any motor cyclist I have enquired of has ever been able to get anything like that result from an ordinary 3½ h.p. model; and I find the general average seems to be somewhere about seventy miles per gallon.



Personally I ride a 1911 pattern of a very popular mount, and over several thousand miles my consumption averages just sixty miles to the gallon. My carburetter is a B. and B., and the jets used are .030 and .032.

It would be interesting, and perhaps advantageous, to learn from a more general body of motorists if the consumption I name is really abnormal, or if the figure you and the makers give is only a "paper" one that cannot be borne out by actual touring experience. If the former is the case, perhaps some hints may be forthcoming to create an improvement. I am sure they would be welcomed by a large number of motor cyclists ENQUIRER.

Three and Four-wheeled Cyclecars.

Sir,—Mr. Stirling mistook my meaning. I did not assert that "the *summum bonum* of all self-propelled vehicles is embodied in a three-wheeler." Such an assertion would be ridiculous; it would imply that I preferred a Morgan runabout to a Rolls-Royce! My point was that, so far, the three-wheeler cyclecar has an advantage over other cyclecars. At present (I make no prophecy as to the future) the four-wheeler labours under this disadvantage, that it must be either belt-driven or be fitted with a differential. To the belt drive there are obvious objections, though I do not for a moment assert that a belt-driven car is "of no good whatever." On the other hand, if a differential be fitted the price of the car is increased, and another complication added. In point of fact, a cyclecar with a differential is practically a small car and nearly as expensive as some small cars. The cyclecar at £130 or £140 should be able to give points to the second-hand car costing £80 or £90 (though at present the cheaper car holds its own), but at that price it does not supply the need which the cyclecar is intended to supply.

For my own part, I think that the R.A.C. and A.C.U. would do well to add to its definition of a cyclecar, "and costing not over 100 guineas." Mr. Stirling, I notice, does not dispute my facts, though he tries to explain them away. I could explain his explanations, but I will not trespass on your space. Allow me, however, to add these additional "facts." In the handicap race at Brooklands on April 20th three-wheelers were first and second, and another three-wheeler made much the fastest time. In the A.C.U. reliability trial on April 24th only one cyclecar—a three-wheeler—obtained a first-class certificate. H. GEORGE MORGAN.

The 25 Miles Bicycle Championship of South Africa, held recently, was motor cycle paced. The pacers may be seen "picking up" their men at the start.

Clashing of Dates.

Sir,—I have read Mr. Brooks's letter in your last issue, and as he refuses to accept my assurances on the point of my committee's ignorance of his club's trial being fixed for the same date, I would ask you, at the risk of using more of your space than the subject probably merits, to place the following consideration before your readers. If my committee had known that another well-known club would be running a similar trial is it likely that they would have deliberately jeopardised the chances of securing a representative entry by selecting the same date?

I only asked you to publish my first letter on this matter in the hope that it would make clear to the Birmingham Club that we have no wish to interfere with anybody's sport, and I am convinced, Mr. Brooks's letter notwithstanding, that the appearance of my letter would have this effect with the average member of the Birmingham Club.

H. J. POOLEY,
Captain North-West London M.C.C.

The Trade and Competitions.

Sir,—I have pleasure to advise that at a meeting of the Motor Cycle Section of this Union, held on May 1st, it was resolved:

"That in future members of this section will not support, either by entries or by contributions to prize funds, any hill-climb, or any competition which includes hill-climbs, if such hill-climbs are to be

(1.) Won on time, and

(2.) Unless the personal assurance of the promoters is given that the hill selected is free from dangerous corners or hair-pin bends."

It is hoped that you will consider such a resolution to be in the best interests of the sport, and that you will give it the desired publicity in your columns.

ALF. BEDNELL.
Secretary, Cycle and Motor Cycle Manufacturers and Traders' Union, Ltd.

The Problem of the Automatic Carburetter.

Sir,—I cannot allow statements appearing in an article under the above heading to pass without comment. Your contributor says "it is essential that the petrol level must be exactly level with the top of the jet in all carburetters with one exception." I would like to say that in the "Binks" two-jet carburetter, when running on the small jet, no matter how slowly the engine is turning round, the velocity of the air up the small choke tube is so great that the height of the petrol is immaterial. This can readily be proved by shutting the petrol tap off, and the engine will run without misfiring until the float chamber be emptied. Then again he says that on opening the extra air port no more air is admitted to the cylinder. This statement is inaccurate. When the engine is revolving at a high rate of speed, the restriction of the choke tube causes friction, and when the velocity of air exceeds ninety feet per second, the flow is restricted, and the effect of opening an extra air port undoubtedly admits a greater volume, and, of course, reduces the velocity past the jet somewhat, consequently reducing the flow of petrol. I also suggest that a motor cycle does not work within wider speed limits than a motor car engine. Almost any well designed car engine will run at half the speed of a motor cycle engine and accelerate to an equal number of revolutions, and all this is obtained in a modern carburetter without having to fiddle about with extra air levers.

The principle on which a two-jet carburetter works seems to be altogether misunderstood by people who are otherwise well informed, and the satisfactory results obtained by these carburetters is due to the fact of one jet automatically correcting the other. So perfect is the action, that no matter at what speed the engine is running up to certain limits the opening of an extra air port makes no appreciable difference.

If your correspondent would care to call at my works with his machine some time, I shall be pleased to fit him a carburetter on, and explain the principle personally on which it works, and he can then corroborate all I say by a road trial.

CHAS. BINKS.

The Trade and the T.T.

Sir,—A good deal has been written criticising the manufacturers' action with regard to the T.T., but very little has been said in their defence.

The manufacturer has to look upon the T.T. race from a business point of view, and the first question which has to be considered is expense. No private owner can have any conception of the cost which such a race involves. The dislocation of a system which it has taken years to perfect, brought about by the necessity to make a special model in the middle of the season, means a loss which can hardly be over-estimated. The firm's most highly skilled riders and testers will be engaged for weeks on these special machines, instead of on their ordinary work of testing and improving the standard models. One or more depots must be established in the island and a huge stock of spare parts sent across. The so-called amateurs competing on the firm's machines will require continual attention, and the entry fees, fares, hotel expenses, etc., all go to swell the total.

Nobody denies that, as a sporting event, the T.T. deserves encouragement, but surely the manufacturer is the best judge of its value from a business point of view.

They are not up against the T.T. to spoil sport, but because they consider the costs and the risks too great; but frame the regulations so that the race is a genuine amateur sporting event, and the financial support which would be forthcoming from the manufacturers would open some people's eyes.

B. MARIANS.

MERSEY M.C. OPEN RELIABILITY TRIAL.

A scene near Cerrig-y-Druidon. The only sidecar survivor—R. Lord (6 h.p. Rex sidette) His passenger is asleep.

Mersey M.C. Twenty-four Hours Trial.

THIS event, which was held on Friday and Saturday last over a severe course partly in North Wales, was to decide the winner of the Butler Cup. Gold medals were also awarded to all who finished within maximum time allowed.

W. Davies (3½ h.p. J.A.P.) and R. Rees (3½ h.p. Rudge) checking in at Ruthin. These two were the first arrivals.

Long before 8 p.m. on Friday the competitors began to arrive on St. George's Plateau, Liverpool, this being the rendezvous, where numbers, armlets, etc., were distributed. From here a move was made to the landing stage and thence over to Birkenhead by a special ferry boat. At nine o'clock sharp the first man was despatched, but had not proceeded far before he skidded, breaking the foot rest and pedal clean off his Rover. As he had nowhere to rest his foot he promptly retired. The first part of the route lay through Chester and on to Worcester.

A Chapter of Accidents.

Before leaving Birkenhead we passed Chas. Murdock (3½ h.p. Singer), who had broken his lamp bracket, and was delayed so long that he retired. In Chester we overtook F. C. Jones (3½ h.p. Bradbury), who had lost his pulley locking nut. This caused the gear to be raised to 3 to 1; he was unable to obtain another nut, so proceeded as far as Hodnet, where rather a nasty accident occurred. Just after passing through the village a sharp corner to the left is encountered. A party were riding together, led by J. M. Lamb (2½ h.p. Premier), who skidded and fell. Fred Dover (3½ h.p. Premier) ran into him, and likewise came off, added to which an Overland car, which was competing, ran into them. Lamb was rather badly injured, and was taken back to Hodnet in the car. Fred Dover, luckily, only cut his eye and slightly hurt his ankle. After helping Dover to repair his rear tyre, which had burst, and generally straighten things out, we gave him a push off, his ankle preventing him from starting himself. After a few yards, however, he discovered that the front forks were badly bent and the tyre was rubbing. He was, therefore, compelled to retire.

At Wellington, the first check, supper was provided. The roads were dry until just before entering Worcester, where a great deal of rain appeared to have fallen, V. E. Horsman (3½ h.p. Singer) had from all accounts fallen asleep and skidded on the greasy tramlines. This brought him off, and as he was badly shaken he decided to retire, and was taken into Worcester on Mr. Percy Butler's Lancia car. The second check was at Worcester, and after partaking of hot coffee, the riders pushed on to Llandrindod Wells.

Breakfast was served at the Bridge Hotel, competitors being timed in and one hour allowed for this meal. Thence the route led us to Welshpool and Bala. Just before reaching the former place rain commenced to fall heavily; however, after we had checked and filled our tanks the weather improved. The roads now became very narrow and twisty, being in parts more like footpaths. A steep hill out of Peny-bont-fawr led us over a mountain pass with a shocking surface and many gates, all of which were closed. The road was very narrow, and from its edge there was a sheer drop of 200 feet to the valley below. Down a very steep hill with a hair-pin bend on it brought us into Bala, where many of the competitors checked in late. The road on to Beddgelert, *viâ* Festiniog and Maentwrog, to start with, was crossed by many gates, all of which had to be opened by the competitors. A fairly steep and tricky hill led us out of Festiniog, where a great number of people awaited the competitors.

At the Royal Goat Inn, Beddgelert, lunch was served and tanks refilled. Just as Mundy was about to start he discovered a nail in his rear tyre and had to effect a repair. When most of the competitors had left W. Heaton (2½ h.p. A.J.S.) arrived, reporting nine punctures and two bursts. While Heaton went into the hotel to secure some much needed refreshment, a non-competitor repaired his rear tyre, and while this was being done the front tyre went down. Surely this was very hard luck!

Outside Beddgelert, on the way to Ruthin through Bettws-y-Coed, we met a great number of cars coming in the opposite direction. In the latter place we noticed one of the new R.A.C. road guides in his smart uniform and on his blue-coloured bicycle. Then the rain started again and continued until Queensferry, which was reached *viâ* Ruthin, where a check was arranged. The rain had made the roads in a shocking condition, and the competitors had to ride with great caution. Many side-slipped and fell, among whom was G. A. Gregson (3½ Bradbury), who skidded while pumping some oil into his machine. He was travelling at a good speed, and was thrown right into the gutter, covering himself from head to toe with mud. On this section J. H. Roscoe (3½ h.p. Singer) skidded, smashing one of the springs of his forks.

At the end of the 24 hours' run. A muddy but happy trio (left to right)—George Wray, Hugh Gibson, and Harry Reed.

Mersey M.C. Twenty-four Hours Trial.—

At Gayton tea was served at 6.15 p.m., and the first man was despatched for Woodside, Birkenhead, after having been allowed thirty-one minutes for tea. Seven and three-quarter miles brought us to Birkenhead, the finishing point.

The following completed the trial :

W. Davies (3½ Victoria-Jap)
C. Hobbs (2¾ Humber)
G. A. Gregson (3½ Bradbury)
F. Rees (3½ Rudge)
W. E. Rootes (3½ Singer)
A. J. Jenkins (3½ Macbeth)
N. Howarth (3½ Bradbury)
N. H. Brown (7 Indian)
A. C. Smith (3½ Rudge)
M. Rimmer (3½ Zenith)
Hugh Gibson (3½ Bradbury)
R. G. Mundy (3½ Singer)
H. Scott Clark (3½ Rover)
G. Wray (3½ Bradbury)
J. Cadwallader (2¾ Enfield)
A. Marston
H. Reed (Dot)
W. Heaton (2½ A.J.S.)
R. Lord (6 Rex Sidette)

The Mersey Club is to be congratulated on the organisation, and everyone commented on this point.

THE LONDON-EDINBURGH RUN.

Further entries for the M.C.C. London-Edinburgh run have been received as follow, the total up to date being 46.

BICYCLES.

F. Wasling (2¾ Enfield)
A. J. Duncan (7 Rex)
S. F. A. Oldfield (2¾ Enfield)
C. Stanley (5 Indian)
H. E. Davison (3½ Rex)
E. Pond (3½ Rudge).
J. Holroyd (2½ Motosacoche)
H. Le Vack (2½ Motosasoche)
J. A. Campbell (3½ Rudge)
Chas Louett (3½ Triumph)
A. Peppercorn (3½ Bradbury)
G. T. Gray (3½ Rudge).
Ronald Clark (3½ Rudge)
H. Frankenstein (3¾ Scott)
Harold Karslake (3½ Rover)
W. C. Henry (3½ Service)
A. E. Catt (3½ Triumph)
Commodore Sir R. K. Arbuthnot (3½ Triumph)
W. F. Newsome (3½ Triumph)

PASSENGER MACHINES.

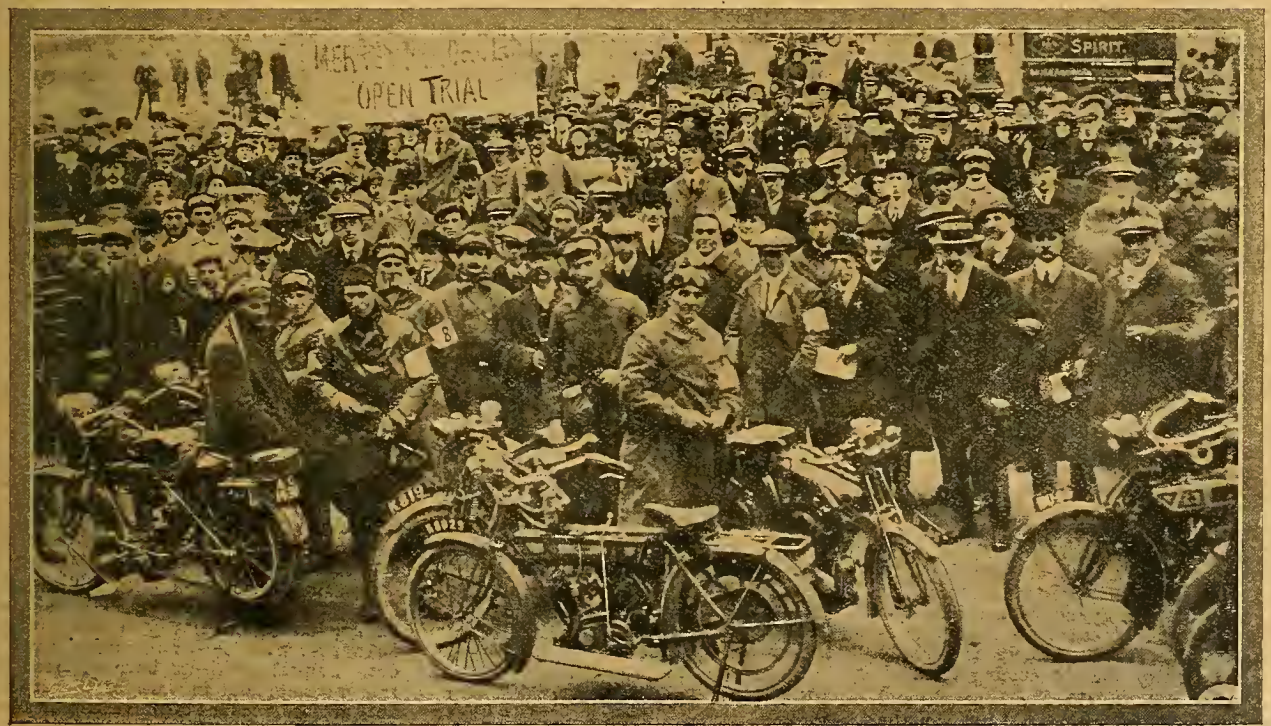
B. Howlett (A.C. Sociable)
H. E. Hull (7 Indian sc.)
C. Bealby (5-6 Clyno sc.)
J. T. Wood (G.W.K. cyclecar)
W. Eggerton (3½ New Hudson sc.)
W. H. Wells (7 Indian sc.)
B. Allan Hill (7 Indian)

A set of three meal coupons for the single and six for the double journey may be purchased for 8s. and 16s. respectively from Mr. H. G. Bell, the trials hon. sec., of 3, Granville Road, North Finchley, N.

THE 1912 T.T. RACES.

As was announced in our issue of last week, Mr. Loughborough, the secretary of the A.C.U., is crossing to the Isle of Man next week to make arrangements for the holding of the above classical events. As will be seen from the list given below, no fewer than fifty entries have already been promised for the two races, so despite the abstention of many trade entries, there is every prospect of the races being successfully held. The preliminary regulations are now out, and entries close on June 1st. All those, therefore, who contemplate supporting these interesting events should send in their entries as soon as possible. The Auto Cycle Union is exerting every effort to render the Isle of Man week as attractive as possible.

SENIOR RACE.



Single or twin-cylinders not exceeding 500 c.c.

O. C. Godfrey (Indian)
C. R. Collier (Matchless)
H. A. Collier (Matchless)
S. A. M. Witham
Blumfield, Ltd. (three machines)
John Gibson
W. H. Bashall (3½ Pat)
J. T. Bashall (3½ Bat)
D. C. Bolton
E. T. Bolton
A. Norton (Norton)
P. Brewster (Norton)
Scott Engineering Co. (two machines)
C. E. Murphy
H. H. Bowen (Dot)
J. W. Woodhouse
I. B. Hart-Davies (Triumph)
C. B. Franklin
P. W. Owen
P. Butler
V. Wilberforce
N. O. Soresby
V. Taylor (3½ Rudge)
W. L. T. Rhys.
Rex Mundy
Percy Johnson
E. B. Ware
J. Alexander, jun. (Indian)
S. F. Garrett (Premier)
H. C. Mills

JUNIOR RACE.

Single or twin-cylinders not exceeding 350 c.c.

P. J. Evans
C. R. Collier (Matchless)
H. A. Collier (Matchless)
F. W. Applebee
J. W. Woodhouse
W. H. Bashall (2¾ Humber)
J. P. Patterson
P. W. Owen (Zenith)
V. Wilberforce
A. E. Woodman (2¾ Humber)
J. H. Watson
V. Taylor
Rex Mundy
Percy Johnson
E. B. Ware
H. Huckle (Enfield)
H. H. Bowen (Humber)

At th finish of the Mersey M.C. Twenty-four Hours Reliability Trial at 8 p.m. on Saturday last.

CURRENT CHAT

TIME TO LIGHT LAMPS.

May	9th ...	8.32 p.m.
,,	11th ...	8.36 ,,
,,	13th ...	8.39 ,,
,,	15th ...	8.42 ,,

Aston Track Race Meeting.

Rain interfered with the motor cycle races arranged by the Sutton Coldfield A.C. at the Aston track last Saturday, and the meeting was postponed until next Saturday.

A.C.U. One Day Trial.

Lionel E. Cass, whose 4½ h.p. three-speed Quadrant gained a first-class certificate in the above trial, asks us to point out that he was inadvertently billed in the programme as Leslie Cass.

Bristol B. and M.C. Hill-climb.

Miss M. Hind asks us to mention that the Rex she rode at the Bristol B. and M.C. climb is a 6 h.p. The old 5 h.p. machine, which she only uses for touring, has an open frame, whereas the 6 h.p. has a special drop frame, which was illustrated in *The Motor Cycle* on February 29th last

Racing in New Zealand.

Triumph machines had quite a tea party, as de Rosier would have called it, at the New Zealand beach races which were held at Warrington Beach. Four events were decided, and the first man in each case was a Triumph rider, the results being as follows:

Two Miles Open Handicap.—W. Jackson (3½ h.p. Triumph).

One Mile Scratch Race (private owners).—A. McDougall (3½ h.p. Triumph).

One Mile Scratch Race (trade).—W. Jackson (3½ h.p. Triumph).

Two Miles Relay Race.—A. Ansell and A. McDougall, both on Triumphs, tied for first place.

The Team Trial.

The following additional clubs have sent in their entries for the M.C.C. team trial, bringing the present total up to twenty-one: Derby and District, Essex M.C., Motor Cycling Club, Sutton Coldfield and Mid-Warwickshire, Northamptonshire, Norwich and District, North Middlesex, and Wolverhampton. Entries must be sent to Mr. F. J. Jenkins, trials hon. sec., 35, Loveday Road, Ealing, W., by June 1st, or by additional fee June 8th. Last year there were twenty competing teams, so that there is already one more entry for the coming trial.

A new club in the Scarborough and District M.C. is raising a team for the M.C.C. Team Trial for *The Motor Cycle* Challenge Cup, on June 15th.

Racing at Brooklands.

There will be two motor cycle events at the B.A.R.C. meeting on Whit-Monday, the 27th inst., viz., handicaps for all classes of machines over distances of 5¾ and 8½ miles.

English-Dutch Reliability Trial.

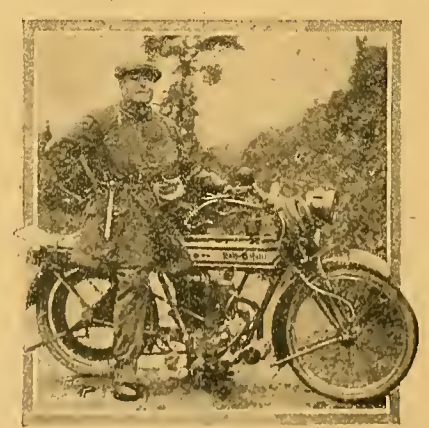
The matter of selecting a representative British team to compete against the team of Dutch motor cyclists in the International Reliability Trial on August Bank Holiday has been taken up enthusiastically by the different motor cycle clubs throughout the country. On going to press seventeen club committees had made their selection, and the voting for the respective competitors was as follows:

PRIVATE OWNERS.

Class A.—Geoffrey Smith 16, C. Maurice Down 12, F. A. Hardy 7, F. C. Wasley 6, J. C. Bennett Mitchell 6, and H. M. Carter 3.

Class B.—Vernon Taylor 15, Fred Dover 13, E. Lester 7, Seymour Smith 6, A. E. Uffleman 5, and R. Cussons 3.

Class C.—W. Cooper 14, C. W. Wilson 10, W. O. Oldman 9, H. C. Few 8, Gordon B. McKechnie 6, and Horatio Wallis 2.



TRADE TEAM.

Class A.—W. W. Douglas 12, R. Holloway 11, R. G. Mundy 8, S. Wright 6, H. V. Colver 5, H. Graham Dixon 5, and J. S. Holroyd 4.

Class B.—W. F. Newsome 15, W. Pratt 13, J. H. Slaughter 8, Geo. Brough 5, F. C. North 4, R. W. Walker 3, and J. Woodhouse 3.

Class C.—Frank Smith 15, F. W. Barnes 14, F. A. Applebee 10, Hugh Gibson 5, W. H. Wells 4, and R. Lord 2.

Club secretaries are reminded that the forms should be returned by Thursday next, the 16th inst.

V. A. Holroyd (Rudge Multi) who, with A. Elson (Triumph) journeyed round the Coventry Club's reliability trial course to erect direction arrows. Observe the bolt with holster for hammer and pouch for nails. The photograph was taken at Saintbury.

SPECIAL FEATURES.

COVENTRY CLUB'S OPEN TRIAL.
(Complete Results.)

MERSEY M.C. 24 HOURS OPEN TRIAL.

MODERN HILL CLIMBS.
(Important Trade Decision.)

Stolen Machine Recovered.

Mr. F. H. Cotterell writes to say that he has recovered his T.T. Triumph, notice of the loss of which was given in *The Motor Cycle*, and that the thief has been arrested.

M.C.C. Members' Hill-climb.

The rendezvous for the M.C.C. members' hill-climb on Saturday is the Lambert Arms, at the foot of Aston Rowant hill, at 1 p.m. The actual hill selected is two or three miles away.

Dublin Reliability Trial.

After examination of the checking sheets, the following results have been announced: 1, F. J. Walker (3½ Rudge) and J. Healy (3½ Rudge), 100 marks (max.) each; 3, J. Brown (3½ Triumph), 99.

Inter-'Varsity Hill-climb.

On Tuesday, the 21st inst., there will be an inter-club hill-climb between the Oxford and Cambridge University Motor Cycle Clubs. The hill has not yet been fixed. There will be six classes: 1.—Lightweight singles and twins up to 350 c.c. 2.—Touring single-cylinder machines. 3.—Touring multi-cylinders up to 1,000 c.c. 4.—Tourist trophy singles (500 c.c.). 5.—Passenger machines up to 1,000 c.c. 6.—All comers. Variable gears will be allowed in all classes. Entries close on the 17th inst., and no late entries will be accepted. Fees: 2s. 6d. per machine. Entries should be sent to Messrs. A. C. Hardy (New College, Oxford) for the Oxford members, and T. M. G. Chapman (Trinity College, Cambridge) for the Cambridge members.

Road Improvements at Gerrard's Cross.

Motorists are fully aware of the dangerous nature of the cross roads at Gerrard's Cross, where the roads from Amersham, Uxbridge, Slough, and Beaconsfield respectively all converge. The danger has long been realised by the local authorities, and some time ago the Road Board granted a sum of money as a contribution towards the cost of effecting an improvement at one of the corners by setting back the hedge, substituting an open iron fence, and opening out the corner, but, unfortunately, local difficulties have arisen which have prevented this work being carried out. Several accidents have occurred at this crossing, and in view of the urgent need for some means of preventing further accidents the R.A.C. is now arranging to erect two of its special danger signs.

Arthur Moorhouse Memorial Fund.

Mr. Vandyk, a member of the M.C.C., has offered an enlarged framed photograph of Mr. Moorhouse to be hung in the A.C.U. premises.

A.C.U. Judges.

Motor cyclists who feel themselves eligible to act as judges in motor cycle competitions may send in their names to the A.C.U. secretary, Mr. T. W. Loughborough, 89, Pall Mall, S.W., when they will receive the consideration of the A.C.U. Competitions Committee. No one connected with the trade in any way is qualified to act in this capacity.

Motor Cyclists and Dogs.

Several motor cyclist members of the A.A. and M.U. have recently reported having been worried by dogs addicted to jumping out into the road at passing motor cycles. The A.A. has taken up one such case by communicating with the owner of the dog, which is an old offender, and impressing upon him the necessity for placing some restraint upon his animal.

Cancellation of Registered Numbers.

At Ripon City Court F. F. Topham, vice-captain of Ripon M.C.C., was fined 1s. (14s. costs) for neglecting to notify the authorities when selling a machine and using the same numbers on his new mount. The purchaser also used this number, consequently two machines were running on the road bearing the same identification marks.

Victim of Negligent Driving.

On the 29th ult. at the Feltham Police Court, Honnslow, the driver of the National Motor Cab Co.'s lorry, which ran into V. Olsson on the last day of the M.C.C. Land's End Run, was prosecuted by the police, convicted, and fined £7 or six weeks' imprisonment for not stopping when called upon after the accident occurred. Mr. Olsson, who is in a nursing home at 15, Welbeck Street, W., is progressing favourably. He asks us to point out that he will be glad to see any motor cyclist friends at the above address.

Reliability Trial in France.

The Grand Prix de Champagne, organised by the Touring Moto Club de France and *L'Aero*, of Paris, will be run on June 9th. This competition, which promises to be one of the biggest motor cycling events of the year in France, will be run on a circuit of fifty-four kilometres, to be covered four times. The circuit is situated in the neighbourhood of Reims, the start and finish being near that town. The route is *viâ* Ponchery-sur-Vesle, Savigny-sur-Ardre, Favorolles, Tramerey, Poilly, Sarey, and Pargny-les-Reims. The following classes have been fixed:

1. 300 cm. for single-cylinders.
2. 350 cm. for twins.
3. 500 cm. singles and 650 cm. multi-cylinders.
4. 1,000 cm. for singles and multi-cylinders.

Entries should be sent to the offices of *L'Aero*, 23, Boulevard des Italiens, Paris. It is hoped that a team of English riders will enter for this competition, which promises to be one of the most interesting ever organised in France.

FUTURE EVENTS

May 11.—B.M.C.R.C. Race Meeting.
„ 16.—Taunton and District M.C.C. Open Hill-climb.
„ 18.—North West London M.C.C. Passenger Trial to Coventry and back.
„ 18.—Streatham and District M.C.C. Open Speed Trial.
„ 18.—Birmingham M.C.C. Open Cyclecar Reliability Trial.
„ 18.—Bradford M.C.C. Annual Open Hill-climb.
„ 18.—Sutton Coldfield and Mid-Warwickshire A.C. Open Amateur Hill-climb.
June 15.—M.C.C. TEAM TRIAL.

Military Motor Cyclists.

The North Midland Divisional Telegraph Company Royal Engineers are in need of several motor cyclists. Any local riders living near Stoke-on-Trent, who are anxious to enlist, should communicate with Lieut. E. T. Bolton, North Midland Division R.E., Lightoaks, Oakamoor, N. Staffs.

The Motor Cycle Union of Ireland.

The Motor Cycle Union of Ireland is about to enter into an agreement with the Auto Cycle Union, so that members of the governing body visiting the Emerald Isle may enjoy the privileges of the M.C.U.I., and members of the M.C.U.I., on a visit to England, may enjoy the advantages offered by the A.C.U.

North-west London Passenger Trials.

The A.C.U. decision in regard to the suggestion of the North-west London M.C.C. to run its passenger trials on the 18th inst. from London to Coventry and Coventry to London, both ways simultaneously, has met with refusal, as it contravenes a rule with regard to passing more than twice on one day through the same town.

Motor Cycles in South Africa.

We read in the *British and South African Export Gazette* that motor cycles have become very popular in the Transvaal. There are over 1,000 in use in Johannesburg, and about 500 more along the Reef. For this district machines should have a clearance of eight inches.

The A.C.U. Silencer Trials.

Messrs. F. E. Baker (F. E. Baker, Ltd.), C. W. Hathaway (Triumph Cycle Co., Ltd.), and John V. Pugh (Rudge-Whitworth, Ltd.) have been selected by the Manufacturers' Union to represent them at a conference between the A.C.U. and Manufacturers' Union in connection with the silencer trials.

Jake de Rosier.

We deeply regret to inform our readers that Jake de Rosier, who was injured on the Los Angeles track, California, will probably never be able to ride a motor cycle again. He hopes, if he recovers, that he may be able to engage in the motor cycle business either here or in America.

Le Mans Automobile Meeting.

The above important French meeting is to be held May 26th-27th and will comprise events for motor cycles. The organisers, the Automobile Club de Sarthe et L'Ouest, recognising the fact that if they wish to secure English entries, the cylinder dimensions of the machines must be the same as for the British Tourist Trophy Races, have altered the maximum cylinder dimensions for the three classes to 250 c.c., 350 c.c., and 500 c.c. The passenger class is open to sidecars and tricars fitted with any size of engine. £400 in prizes will be awarded at this meeting, and the entry fee for motor cycle, sidecar or tricar is twenty francs, which should be sent to the secretary of the A.C. de Sarthe et L'Ouest, Le Mans, France.

In England we are striving to get motor cyclists to join the Territorials as scouts or despatch riders; in Paris every motor cyclist who owns a machine of 3 h.p. or over is compelled by law to register his machine for military purposes. Our photograph shows motor cyclists being registered last week at Paris

Speed and Reliability Trials in Ireland.

Speed Trials on Magilligan Strand.

A SERIES of open speed trials was promoted by the M.C.U.I. at Magilligan Strand, Londonderry, on Saturday last. The afternoon was most favourable, and the sand so firm as almost to resemble a cement surface. Three events, viz., a four miles scratch for engines not exceeding 600 c.c., a ten miles, and fifty miles handicap, comprised the programme. The scratch event was decided on a straightaway course, and the other events on a 2½ miles out and home route. A number of cross-Channel riders competed. In the four miles scratch a field

Saturday's speed trials at Magilligan Strand. W. W. Douglas (2¾ h.p. Douglas) after winning the ten miles race.

of eleven turned out, and the men got away in a bunch. I. Thompson (3½ h.p. B.S.A.) won comfortably from J. Bailie (3½ h.p. B.S.A.), their respective times being 4m. 26⅕s. and 4m. 41⅕s.

Fifteen started in the ten miles handicap. J. Stewart (2¾ h.p. Douglas) was penalised seven minutes through being late at the starting post. W. Douglas (2m.) made the most of his handicap, and at half distance was leading by half a mile. For the tape he was hard pushed by C. R. Martin, 3½ h.p. Triumph (50s.), but managed to maintain his lead by one second. G. E. Murphy, who was on scratch, was travelling the fastest of the three when crossing the tape. Altogether this was an excellently judged handicap. Result:

		Time.
1.	W. W. Douglas (2¾ h.p. Douglas) ...	13m. 46⅖s.
2.	C. R. Martin (3½ h.p. Triumph) ...	11m. 57⅖s.
3.	C. E. Murphy (3½ h.p. Triumph) ...	11m. 59⅖s.

For the fifty miles fifteen started, and great interest was manifested by the large crowd of spectators. Starts were conceded the lightweights up to 121m. J. Stewart (2¾ h.p. Douglas), off the limit, led throughout, though his margin was gradually reduced as the race progressed. W. Douglas retired early with a damaged plug. C. R. Martin rode into second place, but when going strong had to stop and change a plug, and F. C. North went ahead of him. The final rush for the tape was brimful of excitement as Stewart just gained a victory by one-fifth of a second, the placings being:

	Handicap.	Time.
J. Stewart (2¾ h.p. Douglas)	12½m. ...	76m. 26⅗s.
F. C. North (3½ h.p. Ariel)	25s. ...	64m. 21⅘s.
C. Martin (3½ h.p. Triumph)	50s. ...	67m. 37s.

The winner of the fifty miles was awarded the handsome cup presented by Rudge-Whitworth, Ltd.

Dublin and District M.C.C. Reliability Trial.

The open reliability trial of the Dublin and District M.C.C. on Saturday last attracted an entry of twenty-four riders, and of these twenty came to the post and were despatched at minute intervals from three o'clock.

The course for the most part lay in Co. Wicklow, and covered some exceedingly hilly country. It ran from Dublin to Bray, thence through the Glen of the Downs to Ashford, between which point and the summit of Ballymacrae Hill there was a non-stop control. From Ballymacrae the course ran to Laragh, and then along the military road by Drumgoff and Aughavanagh to Aughrim, returning by Woodenbridge, Rathdrum, and Newtownmountkennedy, and Bray to the starting point. The distance was approximately 100 miles, and the customary conditions as to legal limit speed were enforced. There were surprise controls at Aughavanagh and Rathdrum. The ascent of Ballymacrae Hill was the severest part of the trial, and five of the riders failed to make clean ascents. A feature of the competition was the way the Enfield sidecar took the climb. It came up at an exceedingly fast pace, and actually passed several of the singles on the ascent. It subsequently retired from the competition under circumstances that do credit to Mr. Weir, the driver. Descending the sharp hill to Aughavanagh he came across Sparling, who had got a nasty fall by striking one of the many watercourses on the road, and as he was not able to continue, Mr. Weir took his machine, while his passenger, Mr. F. A. Wallen, drove the injured rider in the sidecar to Aughrim, where he got medical attention. He remained at Woodenbridge for the night, but was able to return to Dublin on Sunday.

Eleven of the twenty competitors completed the course in time to give them a chance in the final placings, which will not be known until the secret checking controls are examined. R. Dumphy was a minute too early, but the following were exactly on schedule time, viz., T. J. Dumphy (Triumph), G. Roche (Rover), T. D. Rollins (Rover), J. P. Orvill (Douglas), W. J. Towell (Rudge), J. Browne (Triumph), T. E. Greene (Rudge), J. Healy (Rudge), P. Hurse (Rudge), and F. J. Walker (Rudge). Of these Hurse, Green, Orvill, and Towell were amongst the failures at Ballymacrae.

Dublin and District M.C.C. Reliability Trial to Aughrim and back on Saturday. S. E. Greene (3½ h.p. T.T. Rudge) leaving Donnybrook.

Glasgow M.C.C. Open Hill-climb.

AS usual, the Glasgow M.C.C. opened the Scottish season with its open climb. This took place on Saturday last on a Renfrewshire hill near Howwood. The hill was not severe as regards gradient, but a double bend at the stiffest part provided an extremely severe test, and eliminated nearly half the competitors. Those who took the curve too fast hit the dust, while the nervous ones who took it too slowly knocked their engines to a standstill. The best times were made by those who took the corners cautiously. The electric timing apparatus gave some little tronble during the afternoon, so that the start was made somewhat late. Two runs were allowed, the fastest counting for the formula, which had been simplified this year by eliminating the gear factor, leaving merely $\frac{\text{Weight}}{\text{Cubic capacity} \times \text{time}^{1.5}}$

In the lightweight class there was no doubt of the superiority of the Douglas ridden by A. H. Alexander, although McKechnie on the 2¼ h.p. Levis made quite a good climb. The tourist class was the most popular, and some fine riding was done, a Rudge driven by a well-known Glasgow amateur, W. Hood, making fastest time and also scoring on formula. A. G. MacLennan on a clutch Triumph made second best time, and D. S. Alexander on a 3½ h.p. Kerry-Abingdon was third.

Strange to say, the times in the Tourist Trophy class were slow compared with those made in the full touring class. D. Alexander (Kerry-Abingdon) making fastest time, but being beaten on formula by Anoll Duncan's Rudge, which carried about 40 lbs. of lead beneath the crank case and had the carburetter elaborately adjusted.

A. H. Alexander on one of the new 6 h.p. Rexes with dropped top tube made fastest time in the multi-cylinder class. J. R. Alexander was second by ⅕s. in this class on his 7 h.p. Indian, but beat everybody on time in the passenger class, although carrying three passengers to add weight and to keep the machine down at the corners.

The complete results were as follow :

CLASS I.—Lightweights under 350 c.c.

	Rider and machine.	Weight.	Capacity.	Time M.	Time S.	Fig. of merit.
1.	A. H. Alexander (2¾ Douglas) ...	307	340		43⅘	310
2.	T. L. Rankine (2½ Singer) ...	296	335		52⅕	233
	G. B. McKechnie (2¼ Levis) ..	—	269	1	48⅘	—

CLASS II.—Touring machines under 500 c.c.

1.	W. Hood (3½ Rudge)	361	499		40	286
2.	A. G. MacLennan (3½ Triumph)	347	493		41	265
3.	G. W. Orr (3½ Ariel)	392	482		47⅕	252

CLASS III.—Tourist Trophy models.

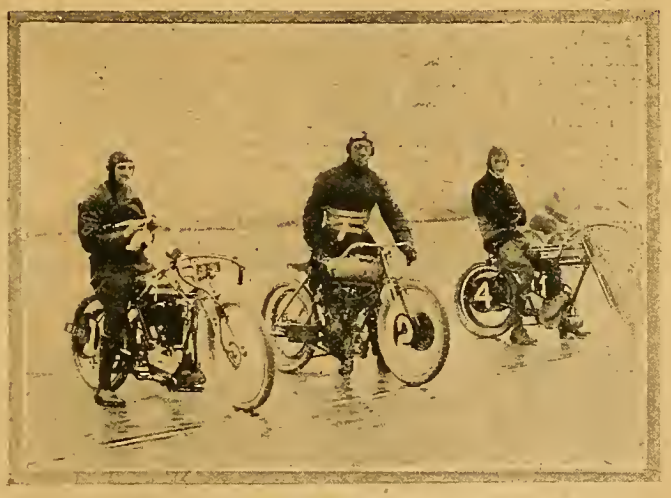
1.	F. Anoil Duncan (3½ Rudge) ...	406	493		44⅖	275
2.	M. Gany (3½ Triumph)	—	499		—	219
3.	A. G. MacLennan (3½ Triumph)	347	499		48⅕	203

CLASS IV.—Multi-cylinders over 500 c.c.

1.	— Alexander (5 Indian)	361	535		39⅗	229
2.	J. R. Alexander (7 Indian) ...	421	994		35⅘	193
3.	A. H. Alexander (6 Rex)	357	896		35⅗	183

CLASS V.—Passenger machines.

1.	G. W. Orr (3½ Ariel)	647	482	1	6⅗	247
2.	J. R. Alexander (7 Indian) ...	947	994		56⅗	224
3.	Ben Paterson (5 Clyno)	681	658	1	0	220



Racing at Brooklands.

THE rain spoiled the second 1912 Brooklands race meeting. It had been raining fairly steadily all day in town, and although three races in all were run off, the meeting had finally to be abandoned By reason of the weather the attendance was by no means good. The only motor cycle race to be run was the Seventh Short Handicap. The start was at the fork, which the machines passed once and then entered the straight. Prizes. The entrant of the winner to receive 8 sovs., the entrant of the second 4 sovs., and the entrant of the third 2 sovs. or cups at option.

Shaw made a good start, but his machine misfired rather badly, and later his belt came off. Slatter stopped just after his engine had begun to fire and got away badly. Competitors passed the fork in the following order: Slatter, Campbell, Stanley, Axford, Elce, Ware, and Stanhope Spencer. Axford (Martin-Jap) won easily. His mount was a smart-looking machine, finished in mauve, fitted with a 76 ×54.5 mm. twin Jap overhead valve engine, Amac carburetter, and Hutchinson tyres. The speed was 58½ m.p.h. Result :

	Rider and machine.	Bore and stroke.	c.c.	Start. M.	Start. S.
1.	S. R. Axford (2 Martin)	76×54.5	498	0	54
2.	G. E. Stanley (1 Singer) ...	69×80	294	1	20
3.	M. Campbell (1 Triumph) ...	85×88	499	1	24
	W. Stanhope Spencer (1 Rudge)	85×88	499	0	38
	W. H. Elce (1 Rudge)	85×88	499	0	44
	N. D. Slatter (1 Alcyon) ...	62×82	247	2	10
	E. B. Ware (1 Rudge)	85×88	499	0	58
	D. Lavender (1 Triumph) ...	85×88	499	1	24
	H. D. Shaw (2 Zenith)	90×77.5	998	scratch	
	G. Griffith (1 Alcyon)	62×82	247	2	10
	J. Cocker (1 Singer)	85×88	499	0	54
	K. Yano (2 Bat)	85×88	998	0	12

Shaw finished with the maximum hand of his speedometer showing what appeared to be 10 m.p.h. over 80, which was the limit of the scale, so he must have travelled well at the outset. He had fitted a neat foot control to his oil pump. It will be seen by the results that Stanley's small Singer was in excellent form. M. Campbell was leading till he entered the straight, and then his engine stopped through the carburetter being starved. He also competed in the May Private Competitors' Car Race. After the third race the meeting was suspended, and was eventually abandoned.

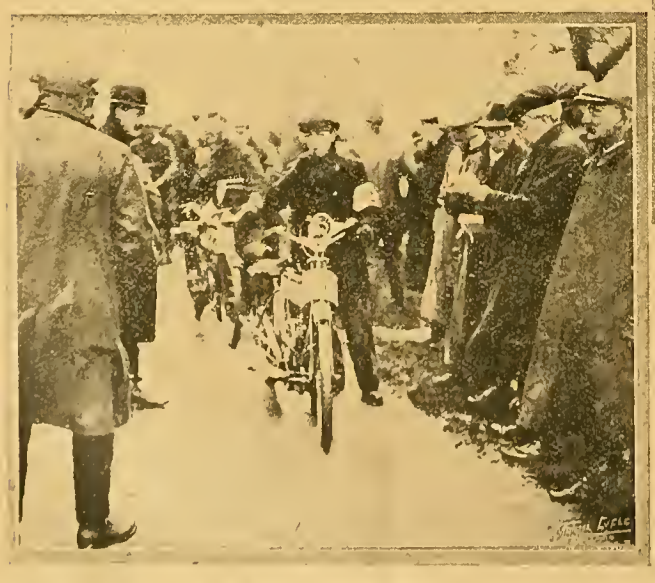
H. D. Shaw (Zenith), K. Yano, a Japanese rider of a two-cylinder Bat-Ja , and W. S. Spencer (Rudge) at the starting line.

A TOUR OF THE RUDGE WORKS.

At the invitation of Mr. Tideswell, manager of the advertising department, we joined a party of the Leicester M. C.C. in their tour of the Rudge works, and spent an interesting and instructive afternoon watching the manufacture of every part of a motor cycle on the latest and most approved lines. During our inspection we saw 170 motor cycles in various stages of completion. Great interest was evinced in many of the processes, notably in the engine assembling. It is wonderful what a lot of work there is to be done even in the manufacture of a spoke, and how quickly it is accomplished by modern machinery. Both the quantity and quality of the productions greatly impressed the visitors, who expressed themselves as highly delighted with their afternoon's tour. When we left thirty had signed the visitors' book, including several ladies.

Coventry Club's Open Reliability Trial.

Nine severe hills included. Rain renders conditions most arduous.



Some of the competitors and spectators assembled on the Kenilworth Road at the start.

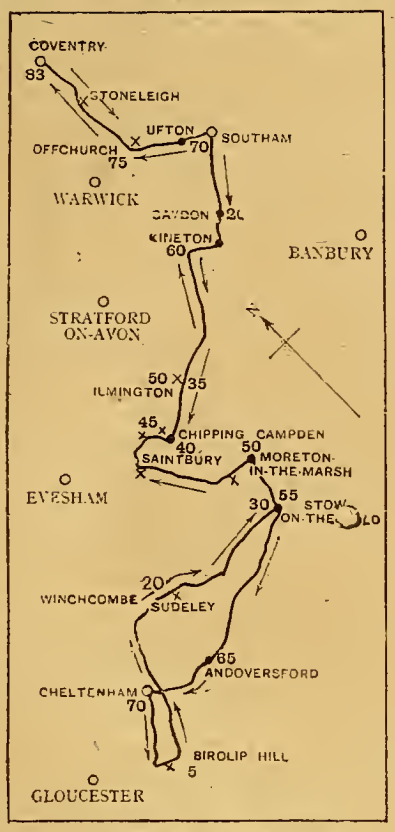
OF the sixty-three entrants for the above trial, which took place on Saturday last, fifty-three duly started, and it can be said at once that they will never forget their experiences. The recent spell of fine weather gave place to rain, which came down with discomforting persistency throughout the day. It will be remembered that the course selected was to be kept secret, and the evening before the trial a meeting of competitors and officials was called, when the route was divulged and programmes handed round, and any questions which competitors desired to ask were answered. The meeting was well attended.

The route was very severe, probably more severe than any course ever selected for a reliability trial. Support is given to this surmise by the fact that only eight accomplished non-stop runs. Competitors described the run as a continuous hill-climb. We reproduce on the next page a map of the route, and the marking of such an intricate course was naturally no light task. On Friday a car load of officials journeyed over the course and erected arrows at every turn, and in the early hours of Saturday Messrs. V. A. Holroyd and A. Elson, with fireman's belts containing hammer and nails, and route cards strapped to their motor cycles, preceded the competitors round the course to verify the positions of the arrows. Despite these precautions some competitors went off the route, and it can only be supposed that the incessant rain soddened the cardboard, or maliciously disposed persons removed the arrows.

There were three ladies in the competition—Miss N. Hongh, who was riding a two-speed Douglas, Mrs. Simpson, the Rudge rider, and Miss L. Berend, who bestrode a Regal-Precision sidecar, but all were unfortunate.

Mr. F. T. Bidlake starting H. Groaves (2¾ h.p. Enfield). Mr. M. J. Schulte, the club president, is at the extreme right.

D. Elson (3½ h.p. Triumph) coming up Offchurch Hill in the rain.



A Prompt Start.

A prompt start was made at 9 a.m., Alec Walsgrove (2¾ Hazlewood) leading off the ball. There were eight competitors in the lightweight class, of whom six started. All got away well, though J. R. Haswell (3½ Triumph) and Miss Berend (Regal Precision) had difficulty in pushing their sidecars off the mark. The brothers Collier, with their powerful Matchless sidecars, shot off the line in fine style, though H. A., not noticing the very first twist to the right, attempted to turn too quickly, and in so doing, wrenched the rear tyre off the rim. He returned to the starting point, and after repairs, went on again. There was an abundance of officials on the course, which was absolutely necessary in view of the dozen or so rises all having single figure gradients, and on which the competitors were observed but not timed.

Coventry Club's Open Reliability Trial.—

The Route.

The route led through Stoneleigh up the famous Coventry test hill, to Offchurch, where is a steep short pitch with a bad approach, then to Ufton, a long gradual climb. From Southam to Gaydon presented no difficulty, and just beyond Kineton the Fosse road was joined and continued upon till Ilmington village was reached; the hill beyond is severe, with a maximum gradient of about 1 in 6. On through Chipping Campden and up to the summit of Weston Hill (another of the Cotswold acclivities), and, descending the other side, the Stratford-Broadway road was joined at Weston-sub-Edge and followed to the turn for Saintbury, now a well-known ascent. Arrived at the top, the main Worcester - London road was traversed through Bourton-on-the-Hill to Moreton-in-the-Marsh and Stow-on-the-Wold. At the last-named bleak Cotswold town a sharp right turn led to Andoversford and Cheltenham. The hills on this section were not exceptionally steep, but the road undulates severely nearly all the way, and on a wet day the ascent to the inn at Naunton is trying to under-powered machines. After Cheltenham a detour embraced the notorious Birdlip, then, skirting the Cheltenham suburbs, Cleeve Hill was ascended, then came a drop into Winchcombe. A sharp right turn in the centre of Winchcombe brought the competitors to Sudeley Hill, a new find of the Coventry Club and one of the worst ascents on to the Cotswolds. It is considered by many in the trial to be much worse than Birdlip. The rise commences at the gates of Sudeley Castle and gradually climbs up for about a mile, then follows a long section of single figure gradient culminating in a pitch of 1 in 6 for a considerable distance, and, just when one thinks the top is reached, a bend to the right discloses another long stiff ascent. The top is nearly 1,000 feet above sea level, and the total rise is about 700 feet. The surface is oolite, mostly rough, and holding and treacherous when wet. From Sudeley the outward route was joined at Stow-on-the-Wold, and, with the exception of the hill in Bourton, the ascent from Weston-sub-Edge, the rise to Ilmington, and one or two short steep banks on the Fosse, the remainder was easy.

THE COVENTRY TRIALS ROUTE.
× denotes a steep hill.

Nine Severe Hills

The following figures show the heights in feet above sea level reached during the trial: Ilmington, 600 feet; Camp *via* Saintbury, 864 feet; Birdlip, 940 feet; and Sudeley, 982 feet. The valley roads averaged about 200 feet above sea level. In all, nine severe hills were climbed, and a number of lesser ascents.

Troubles commenced early. Sproston (Rudge) came to a standstill on Stoneleigh, which was in a very greasy condition owing to the overhanging trees, and a few miles further on C. B. Collier (Matchless) had to replace a broken valve spring. S. Wright (Humber) and S. Crawley (Triumph) experienced punctures, and were dogged throughout the day by the puncture fiend.

On Ilmington Hill.

A secret check was arranged on the outward and homeward runs, and Ilmington was the spot selected by Mr. F. Straight, the timekeeper. Ilmington Hill is a severe climb almost on a par with Edge Hill. Notably good climbs were made by A. Walsgrove (2¾ Hazlewood, three-speed), Miss Hough (2¾ Douglas, two-speed), T. Pollock (3½ James), W. D. Sonth (3½ T.T. Rudge), Vernon Taylor (3½ Rudge), P. Moss (3½ Premier, three-speed), S. Crawley (3½ Triumph), R. Viggers (3½ Macbeth-Precision), J. H. Pountney (3½ Rover, three-speed), and K. Clark (3½ Corah, three-speed). Of the passenger machines nearly all the big twins made light work of the hill, but special mention is due to J. R. Haswell (3½ Triumph, two-speed sc.), who changed down about halfway up and romped up the remainder on his low gear; S. Wright (3½ Humber two-speed sc.) was troubled with a slipping belt, but he got up, although slowly towards the top; A. D. Arter (3½ James sc.) also made an excellent climb. A few failures occurred, but it is only fair to point out that the first twenty riders had a much drier road than the remainder, as the rain fell faster during the second half of the climb. The following lost marks: T. Carpenter (2½ Calcott) stopped, H. A. Crane (3½ Hercules) stopped, H. G. Hill (2½ Calcott) pedalled, C. Q. Roberts (3½ Rover) pedalled, Miss Berend (3½ Regal-Precision sc.) stopped, and J. W. F. Crouch (6 C.M.C.) stopped road wheels.

Saintbury was the next hill of note, and at this point nine competitors were added to the list of the fallen. H. G. Hill ran alongside his Calcott, but T. Carpenter came to a standstill, as did H. A. Crane, who charged a wall at the foot of the hill. Others who stopped were: Martin Anderson (Swift), R. Viggers (Macbeth), S. Wright (Humber), J. W. F. Crouch, and Miss Berend. C. T. Newsome (Rover) was the victim of bad luck, as he had surmounted the steepest portion when his belt jumped off the pulleys. Miss Hough (Douglas) made as good a climb as any competitor in the trial, and, we believe, climbed the whole of the ascent on top gear. All those who showed up conspicuously on Ilmington reproduced their form on Saintbury Hill, and in fact on most of the hills until Sudeley was reached, of which more anon. Mrs. Simpson (Rudge) made a very good climb. The passenger machines were climbing the hills well. Collier Bros. had plenty of power in reserve. Tessier (Bat) and Hill (Indian) also did well. G. E. Cuffe (7 h.p. Indian sidecar) skidded round the bend, his sister, who occupied the sidecar, lying across the carrier to keep the rear wheel on the ground.

The course was now of an undulating nature, but with no really notable ascent before the luncheon stop, which

Vernon Taylor (3½ h.p. Rudge) on Ilmington Hill. He was one of the eight competitors to accomplish a non-stop run.

Coventry Club's Open Reliability Trial.—

was at Cheltenham, lunch being taken at the Queen's Hotel. On arrival here, A. D. Arter reported that his machine momentarily caught fire, necessitating a dismount. Competitors fully appreciated the hour and a half allowed, seeing that they were in most cases drenched. S. Wright (Humber sidecar) arrived late, and reported five punctures. F. Smith (Clyno) was also late, due to a broken chain. H. S. Morgan withdrew his runabout owing to tyre troubles. The spacious hotel yard presented a busy scene as the first man was despatched at 2.10 p.m. in the direction of Birdlip. The arrangements and marshalling hereabouts were well carried out by Messrs. F. Corbett and H. A. Cooke.

Birdlip and Sudeley Hills.

The road surface was extremely heavy, but, nevertheless, the majority of the survivors made clean and sure ascents of this noted rise over the Cotswolds, the variably-geared machines winding their way up steadily but surely, the single-speeders racing up the hill ten to fifteen miles an hour faster

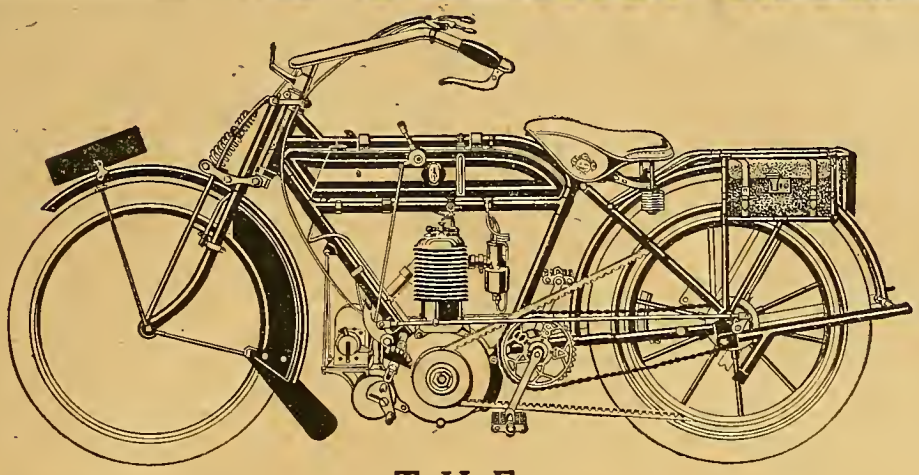
Cleeve Hill, Cheltenham, was the cause of much engine knocking, but this ascent was nothing to what followed soon after Winchcombe was reached. The Coventry and Warwickshire Motor Club officials managed to unearth a hill which, we predict, will prove a stumbling block to motor cyclists for years to come. We refer to Sudeley Hill, the gradient of which is estimated to be 1 in 5 to 1 in 6 for about a quarter of a mile, although the hill itself is over a mile long. Sixteen came to grief at this point, including a number who had hitherto experienced no trouble. As it was the last hill of note, these competitors are especially to be sympathised with. Some notably good climbs were made. W. F. Newsome (free engine Triumph) appeared to travel as fast as anyone, but about midway up the hill he skidded for about ten yards, narrowly missing *The Motor Cycle* photographer, who threw his camera into the air and backed into the ditch. Newsome kept his engine running, and managed to correct the skid in wonderful fashion. S. Russell Cooke (Rudge) and Cyril Bailey (Rudge) assisted with their feet. and P W. Pumphrey (Arno) reached the very crest of the hill when he was obliged to jump off and run alongside for a few yards. Roy Walker (New Hudson) made a sure climb, as did Mrs. Simpson (Rudge), H. Millidge (Premier), H. G. Dixon (New Hudson), and L. Newey (three-speed Ariel). M. H. Simpson (Rudge) skidded into the ditch. T. Pollock (single-geared James) had a clean record up to this point, and would have climbed Sudeley but for the fact that his machine skidded three times, and each time he had to lift

CLIMBING SUDELEY HILL, WHICH UNSEATED 16 COMPETITORS.
A. D. Arter (3½ h.p. two-speed James and canoelet sidecar), who successfully climbed all hills.

the valve to correct the skid, and in so doing nearly stopped his machine. J. Slaughter (L.M.C.) resorted to his low gear and went up at a comfortable pace.

Of the sidecars the two Matchless machines climbed the hill without difficulty, although beaten for speed by S. T. Tessier (Bat). Alan Hill and G. E. Cuffe (7 h.p. Indian sidecars) spoilt their otherwise clean records. Undoubtedly the most meritorious ascent was by J. R. Haswell, a popular Coventry Club member, on a two-speed 3½ h.p. Triumph sidecar. His engine certainly had very little in hand on Sudeley, but few expected that a 500 c.c. machine with sidecar and passenger could account for such a hill on the run. A. Douglas Arter (James) was the only other successful single-cylinder sidecar user to climb Sudeley

The Crouch carette appeared to have sufficient power to climb the hill, but insufficient weight on the back wheel, which necessitated the passenger walking to the summit. Fred Hill (A.C. sociable) made a gallant attempt, but the gradient was too much for his engine, although he got within a stone's throw of the top. The G.W.K. driven by C. M. Kellier was anxiously awaited, but a competitor reported that he had passed this machine hung up by the roadside.



The Most Severe Trial.

By this time competitors were unanimous in the opinion that the Coventry Club's trial was as severe as any ever held, but the hill-climbing was not yet over, for Guiting Grange and Weston-sub-Edge further taxed the hill-climbing powers of the competitors' machines. Perhaps the hardest piece of luck in the whole trial occurred at this point. Alec Walsgrove, who had successfully accounted for all hills on his 2¾ h.p. Hazlewood, was brought to a standstill at Weston due to a stone jamming the brake on the front wheel. Still, he was the only competitor in the lightweight class to finish to time, which is indeed a meritorious performance considering the arduous nature of the course and the weather and road conditions.

From Chipping Campden homewards was comparatively easy, except for occasional trouble in finding the course, due to the absence of arrows. G. E. Cuffe (Indian) damaged his sidecar wheel owing to running on a flat tyre, so he detached the sidecar, put his passenger in Alan Hill's sidecar, and continued solus. Frank Smith (Clyno) broke a chain and retired, as also did Fred Hill (A.C.) A few miles from home H. Millidge (Premier) and H. Newey (Ariel) ran out of petrol, and were delayed considerably in obtaining fresh supplies. The same trouble befell C. Q. Roberts (Rover), whose first stop was due to a broken belt.

R. Viggers (3½ h.p. three-speed Macbeth-Precision) climbing Ilmington Hill.

THE

B.S.A MOTOR BICYCLE

"Perfect in Every Part"

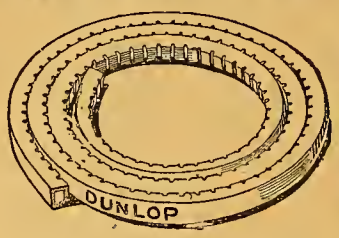
has attained its foremost position by sheer superiority, which is being constantly demonstrated in reliability trials, hill climbs, and on the road. This is due to the quality of B.S.A. workmanship and material. Each part is severely tested at every stage of manufacture. As in all B.S.A. productions

Every Part is Guaranteed Interchangeable.

The annoyance of waiting for spare parts is dispelled as these can be supplied direct from stock. This scrupulous care in construction is justified by the growing popularity of B.S.A. motor bicycles amongst riders who require a reliable mount to take them anywhere at any time with speed and comfort.

A.C.U. One Day Trial, April 24th. 1912.

A Private Owner on a B.S.A. Motor Bicycle made a non-stop run, and was awarded a SILVER MEDAL and FIRST-CLASS CERTIFICATE.



Model A -	With fixed engine and fitted with pedalling gear	**£50 0 0**
Model B -	With free engine and double cone clutch in back hub; pedal-starting from saddle	**£56 10 0**
Model C -	With free engine and two-speed gear in back hub; gear operating by foot lever, which can be locked by control lever on handlebar ..	**£60 0 0**
Model D -	Tourist Trophy; without pedalling gear, fitted with 26" x 2" Dunlop tyres, semi-racing handlebar; wheelbase 3¼" shorter than standard ..	**£48 10 0**

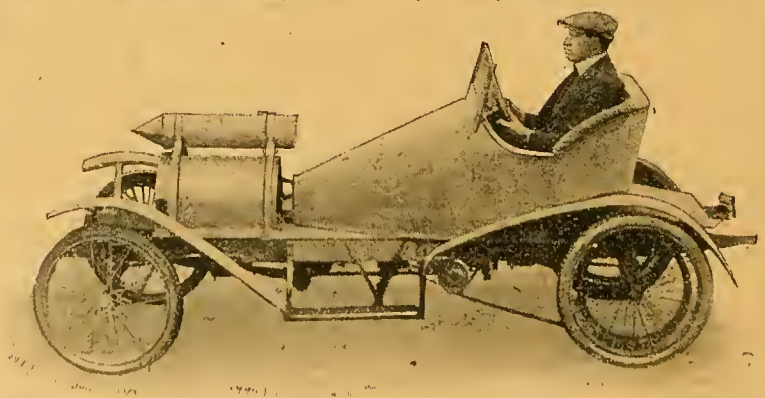
A Motor Cyclist's advice—"Always use B.S.A. Cylinder Oil for Motor Cycles."

An inventive Scot who built his own cyclecar narrates his experience of the

DUNLOP  BELT DRIVE



Mr. ROBERT SMELLIE, a West-of-Scotland motorist, recently designed and built for himself a cyclecar which has attracted much attention, as it is employed for the conveyance of goods as well as passengers. In this car, which is driven by a 5-6 h.p. air-cooled engine, no fan is used, and there is no differential; it has two speeds and reverse, and the transmission is by means of Dunlop motor cycle belts, which have run over 4,000 miles and are still in good condition. Of these belts Mr. Smellie writes in terms of the highest praise; and his views, based on expert knowledge, will be of value to other motor cyclists, particularly to those who look with approving eyes on cyclecars. Writing from "Inchbrae," Easterhouse, Lanarkshire, Mr. Smellie says—

"I have much pleasure in stating that the Dunlop belts have greatly exceeded my expectations. Up to the present—March 30th—they have done over 4,000 miles, and the only wear that is obvious is on the main belt from engine to countershaft. The two belts to the driving wheels are absolutely unscratched, and, as far as I can judge,

I do not see what is to hinder them running 20,000 miles.

This may sound a bit strong, but anyone with any experience whatever, examining the belts at present, would be astonished at their new appearance.

Further, the car is out in all weathers, and meantime the belts have no protection whatever. Needless to say, I wash them carefully after a very muddy run."

THE DUNLOP MOTOR-CYCLE BELT gets through the hardest work without flinching, singly or in combination. In addition to the usual sizes, it is now made in 1⅛in., and the cost is only 3/1d. per foot. The standard lengths are: 7ft. 6in., 8ft., 8ft. 6in., and 9ft. DUNLOP BELT PIERCERS AND BELT FASTENERS should be carried in every wallet.

THE DUNLOP PNEUMATIC TYRE CO., LTD., Aston Cross, BIRMINGHAM; Alma Street, COVENTRY.

BRANCHES—London, Nottingham, Manchester, Newcastle, Bristol, Leeds, Liverpool, Glasgow, Dublin, Belfast.

Coventry Club's Open Reliability Trial.—

J. W. F. Crouch (C.M.C. Carette) finished late, but to him is due the credit for being the only cyclecar competitor to complete the course. The run home was rather a cold one, and this added to the rain, which hardly ever stopped all day, made the majority glad that the test was over.

Official Results and Awards.

The following results were passed by the committee of the Coventry and Warwickshire Motor Club at a meeting held on Monday evening:

CLASS A.—LIGHTWEIGHTS.

		Marks lost.
1.	Alec Walsgrove (2¾ Hazlewood, 3-speed) ...	84
	H. G. Hill (2½ Calcott, 3-speed)	246

MACHINES OVER 350 C.C.

1.	W. F. Newsome (free engine Triumph) ...	9
	J. H. Slaughter (4 L.M.C., 2-speed) ...	18
	A. N. Barrett (3½ Rudge, multi)	21
	Roy W. Walker (3½ New Hudson, 3-speed)	21
	J. H. Pountney (3½ Rover, 3-speed) ...	24
	Vernon Taylor (3½ Rudge, multi)	32

The above six competitors made non-stop runs.

CLASS B.—SIDECARS.

1.	J. R. Haswell (3½ Triumph, 2-speed) ...	4
	R. E. Guest (8 Matchless, 2-speed)	15

The above competitors made non-stop runs.

CLASS C.—CYCLECARS.

1.	J. W. F. Crouch (C.M.C.-Carette)	224

Souvenirs will be awarded to all who made non-stop runs.

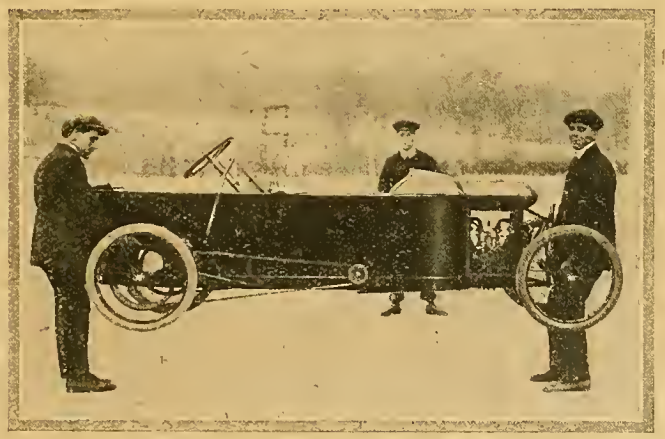
SPECIAL AWARDS.

Best performance by a lady.—Mrs. Simpson (3½ Rudge).

Best performance by a Coventry Club member.—J. R. Haswell (3½ Triumph sc.)

Best performance on a single-geared machine.—W. F. Newsome (3½ Triumph).

Best performance by a private owner.—R. E. Guest (8 Matchless sc.)



Those who survived the course in addition to the above-mentioned, but did not make non-stop runs, were:

CLASS A.	Marks lost.
S. A. Rowlandson (3½ Rudge)	26
L. Newey (3½ Ariel)	27
H. Millidge (3½ I.T. Premier)	35
C. Q. Roberts (3½ Rover, 3-speed)	52
R. H. Viggers (3½ Macbeth-Precision, 3-speed)	57
C. T. Newsome (3½ Rover, 3-speed)	64
S. Russell Cooke (3½ T.T. Rudge)	72

The Cyclecar Hour Record.

The first cyclecar to establish the hour record was the 8 h.p. Bedelia. The particular car entered was absolutely standard and so, Mr. L. N. Palmer assured us, quite devoid of any special tuning. The engine is a Bourbeau-Devaux, 80 × 100 mm., and with the cylinders set at 90°. The firing was by magneto, driven by chain off the main shaft, and running at half engine speed, while the distributer was driven off the half-time shaft. The engine was fitted with automatic inlet valves. The lubricant used was commercial castor oil, and Michelin tyres, 650 × 60, were fitted.

A start was made at 4.42 last Friday afternoon. The engine started misfiring at once, and continued to do so throughout the trial. This was due, we were informed, to the G. and A. carburetter, which was of the two-jet chamber type, the float chamber being in the middle. This carburetter, it may be remembered, is supplied with a series of balls which are lifted off their seating by means of the suction of the engine, thus admitting air in correct proportion to the engine speed, and consequently to the amount of petrol drawn through. The uneven surface on the track caused these balls to joggle up and down and to upset the mixture. The first lap was covered at the rate of 46.81 miles an hour, and the third, which was the fastest, was covered at 46.89 miles an hour. At the 8th lap the speed dropped to 41.45 miles an hour. After that the speed improved, in the tenth lap, to 42.75, falling to 41.84 m.p.h. in the last lap. The total distance covered was 43 miles 1,034 yards. H. Ward, the driver, had rather a poor time, as the deck chair seat gave way, and he had to sit on the bar to which the cloth portion is attached.

The 8 h.p. Bedelia driven by H. Ward (at the rear of the vehicle) which established an hour record of 43 miles 1,034 yards at Brooklands last week.

The Arthur Moorhouse Memorial Fund.

The following additional donations to the above fund have been sent in since the list was published last week.

All subscriptions should be sent to the secretary, Mr. T. W. Loughborough, 89, Pall Mall, S.W.

CLUB NEWS.

Redditch and District M.C.C.

A speed-judging competition to Kidderminster was held on the 27th ult. Results: 1, J. Fisher, 1m. 20s. slow; 2, H. Malins, 1m. 25s. slow; 3, G. White, 1m. 56s. slow.

Leeds M.C.C.

A hill-climb took place at Beulah Hill on the 4th inst. Some close finishes were witnessed, especially so in the semi-finals and final, the results of which were:

The winning riders and machines at the conclusion of the Leeds M.C.C. Hill-climb at Beulah. R. T. Cawthorne (6 h.p. chain-driven J.A.P.) and C. H. Benn (T.T. Triumph). The latter won.

Semi-finals: C. H. Benn (3½ h.p. T.T. Triumph) beat Jim Mackay (2½ h.p. Singer). Cawthorne (6 h.p. J.A.P.) beat Hawks (3½ h.p. multi Rudge).

Final: C. H. Benn beat Cawthorne.

Lowestoft M.C.C.

All motor cyclists who would like to become members of a motor cycle club, which is in course of formation, are invited to communicate with Mr. A. Elkington, 11, Royal Avenue, Lowestoft.

Canterbury and District M.C.C.

The results of the hill-climb held at Petham on the 25th ult. are as follows. The formula used in all classes was $\frac{W}{C \times T^2}$, as recommended by *The Motor Cycle*, twins having one-tenth of their capacity deducted. T.T. machines were handicapped +1⅝s.:

CLASS I.—Any type of machine, including Pavillet Cup Competition.

	Time.	Result on formula.
1. H. Pavillet (2½ Singer)	+18⅝s. ...	694
2. S. Timson (3½ T.T. Rudge) ...	+12⅝s. ...	682
3. B. Martin (3½ T.T. Rudge) ...	+13 1/10s. ...	631

CLASS II.—Single-cylinders under 560 c.c. of later pattern than 1910.

1. H. Pavillet (2½ Singer)	+16 1/10s. ...	781
2. S. Timson (3½ T.T. Rudge) ...	+12s. ...	702
3. B. Martin (3½ T.T. Rudge) ...	+11 9/10s. ...	678

CLASS III.—Any type of machine, 1910 pattern or earlier.

1. C. Dawson (3½ Triumph, 1908) ...	+17⅛s. ...	512
2. W. Wass (3½ Triumph, 1909) ...	+22½s. ...	382
3. A. Letchworth (7 V.S., 1909) ...	+15½s. ...	378

CLASS IV.—Any type of machine, for members who have never won a prize in a club hill-climb.

1. Lieut. H. Simonds, R.N. (3½ Trump-Jap)	+12 7/10s. ...	652
2. B. Martin (3½ T.T. Rudge) ...	+13 3/10s. ...	623
3. C. Dawson (3½ Triumph, 1908) ...	+17⅝s. ...	493

CLASS V.—Open to club members of the trade, any machine.

1. H. Pavillet (2½ Singer)	+14 9/10s. ...	835
2. G. Crump (3½ Rudge)	+12 1/10s. ...	653
3. J. Poxon (3½ Bradbury)	+14 1/10s. ...	582

No rider takes more than one first and one second.

A Motor Cycle Club for Clapton.

All motor cyclists are invited to attend a meeting which is to be held this evening at Messrs. Delange, 83, Chatsworth Road, Clapton, at nine o'clock.

Taunton and District M.C.C.

A fifty mile reliability trial was held on the 25th ult. in two sections, each of which had to be non-stop and covered at the rate of 19 m.p.h. Results: 1, E. R. Norton (2¾ Enfield), non-stop, total error 17s.; 2, W. Phillips (3½ Triumph), non-stop, total error 20s.; 3, E. Hancock (3½ Premier), non-stop, total error 25s.; 4, T. G. Crump (3½ Ariel tricycle), non-stop, total error 26s.

Western District M.C. (London).

The reliability trial to Bath and back for the Smart Cup was successfully run off on the 5th inst. Subject to confirmation by the committee, the results are: 1st, W. Ritchie (5 h.p. N.S.U.), non-stop, 14s. slow; 2nd, F. Ritchie (8 h.p. Matchless), non-stop 30.2s. slow. The other competitors did not make non-stop runs. W. Ritchie has won this cup on two previous occasions, and will therefore, if the above are confirmed, win the trophy outright.

Cork and District M.C.C.

Two hill-climbing tests were run off by this club on Wednesday, the 1st inst., at Grange Hill, Ovens. The results were:

Flexibility Test.—Class A: S. R. Hosford (2¾ h.p. Enfield), slow, 1m. 35⅖s.; fast, 1m. 5s.; difference, 20s.

Class B.—1, P. A. Egan (3½ h.p. T.T. Bradbury), slow, 2m. 55⅕s.; fast, 43⅕s.; difference, 2m. 12s. 2, H. P. Dobbin (3½ h.p. Triumph), slow, 2m. 18⅖s.; fast, 1m. 38⅕s.; difference, 40⅕s.

Restarting Test.—1, P. A. Egan (3½ h.p. T.T. Bradbury), time 1m. 16⅘s.; 2, J. Atkinson (3½ h.p. Rudge), time 1m. 25⅖s.; 3, J. Healy (3¾ h.p. Premier), time 1m. 26⅘s; 4, S. R. Hosford (2¾ h.p. Enfield), time 1m. 32⅖s.

Sheffield and Hallamshire M.C.C.

A hill-climbing competition was held at Bradfield on Saturday, May 4th. Results:

CLASS I. (lightweights).—1, S. Swift (2¼ h.p. Levis), time 1m. 31⅖s.; 2, A. Parker (2¾ h.p. Douglas), 1m. 34⅖s.

CLASS II. (standard single-cylinder machines).—1, D. Bradbury (3½ h.p. Norton), 44⅘s.; 2, F. Cawood (3½ h.p. Triumph), 55⅗s.; 3, N. Newton (3½ h.p. Rudge), 59⅖s.

The results in Class II. on formula are: 1, D. Bradbury; 2, N. Newton; 3, F. Cawood.

The fastest time of the day was accomplished by D. Bradbury on his 3½ h.p. Norton, 44⅘s. The next fastest was R. Garnett (6 h.p. Matchless), 45⅗s.

Master S. Swift, the smallest rider and machine in the Sheffield and Hallamshire M.C.C. His mount is a 2¼ h.p. Baby Levis. The photograph shows him making fastest time among the lightweights.

Club News.—

Daimler M.C.C.

The following runs have been arranged: May 12th, Lutterworth; May 25th, novelty run.

Hull and East Riding A.C.C.

The first quarterly trial was held on the 27th ult. There were ten starters, and the course was *viâ* Hull, Beverley, York, Malton, Beverley, to Hull, ninety-four miles. There were three water splashes on the road, which was very hilly, and only four competitors survived the entire distance—Emerson (3½ Norton), Pickering (3½ Rudge), Brown (3½ Rudge), and Walton (3½ Rudge).

Sheffield and Hallamshire M.C.C.

A speed-judging competition was held on the 27th ult. The course was from Millhouses to Bakewell, a distance of fourteen miles. Speeds varying from 20 to 14 m.p.h. were set, watches and speedometers being barred. There were seventeen entries, and the results are as follows:

	Rider.	Speed set.	Error.
1.	H. Short	15 m.p.h.	0s.
2.	T. Durant	18 ,, ...	5s.
	S. Brooks	20 ,, ...	5s.
4.	F. Cawood	15 ,, ...	10s.

Derbyshire and North Stafford A.C. (Motor Cycle Section).

A petrol consumption trial took place on Saturday, the 27th ult., and attracted a good number of entries. The ton-miles gallons formula had been adopted, *i.e.*, the greatest number of ton-miles which can be secured for one gallon of fuel. The start was from Repton, and the course lay through some beautiful, picturesque country to Burton, thence to Repton again. This had to be covered twice, making a total distance of twenty miles. Results:

1. N. Sayer (Bradbury) ... ... 24.7 t.m.g.
2. J. Birchenough (Rudge) ... ... 24.3 ..
3. E. Russell (Bradbury) ... ... 22. ,,

Cardiff M.C.

The following classes have been arranged for the inter-club hill-climb on Rhubina Hill, near Cardiff, next Saturday:

Class 1.—For touring lightweight motor cycles whose cylinder capacity does not exceed 350 c.c.

Class 2.—For T.T. lightweight motor cycles (single or twin) whose cylinder capacity does not exceed 350 c.c.

Class 3.—For touring single-cylinder motor cycles whose cylinder capacity does not exceed 560 c.c.

Class 4.—For T.T. single or twin-cylinder motor cycles whose cylinder capacity does not exceed 500 c.c.

Class 5.—For twin-cylinder motor cycles whose capacity is over 480 c.c.

Class 6.—For any motor cycle of unlimited capacity, with sidecar passenger attachments.

Classes 2 and 4 will be decided on time.

Classes 1, 3, 5, and 6, will be decided on the following formula: $\frac{W}{C \times T^2}$ which is that recommended by *The Motor Cycle*.

W = weight in lbs.
C = cubic capacity.
T = time in seconds (squared).

Luton and South Bedfordshire M.C.C.

The hon. secretary of this lately formed club is Mr. R. C. Knight, 68, Dunstable Road, Luton. It has been decided to affiliate to the A.C.U.

Surrey M.C.C.

The team reliability trial on the 15th inst. will take the form of a run of between sixty and seventy miles, starting from Guildford at 3.30 p.m. A halt for tea will be made at the half distance. Entrants will be divided into teams of four, of whom one in each team must drive a passenger machine. So far as possible the teams will represent districts (Guildford, Haslemere, Dorking, etc.) Penalties will be imposed for *(a)* stoppages other than traffic stops, *(b)* bad performances on hills, and *(c)* errors at control stations.

The Brookdale Club, Catford (Motor Section).

The results of the hill-climb at Brasted are as follows:

Handicap.—1, L. W. Fox (Rudge); 2, W. Williams (Bradbury).

Slow Climb, Single Gear.—1, S. Jeffery (B.S.A.); 2, H. Smart (Bradbury).

Slow Climb, Variable Gears.—1, W. Guiver (Rudge multi); 2, W. Plimmer (Douglas two-speed).

Fastest Time.—H. A. Cooper (Bradbury) and J. A. Hoult (Bradbury), dead heat.

North-West London M.C.C.

The twelve hours' open reliability run for cyclecars and sidecars will take place on the 18th inst.

RULES AND REGULATIONS.

Cyclecars may have three or four wheels and may be single or double-seated. Chassis weight must not exceed 6 cwts. unladen, and the total piston displacement of engine must not exceed 1,100 c.c.

Passenger machines must carry two or more persons throughout the entire competition.

The route to Coventry shall be *viâ* Watford, Berkhampstead, Aylesbury, Bicester, Banbury, Sunrising Hill, Ettington, Warwick, and Kenilworth, returning the same way.

The start will take place from Jack Straw's Castle, Hampstead Heath, at 7 a.m.

Any driver who shows himself inconsiderate to other users of the highway shall be subject to disqualification.

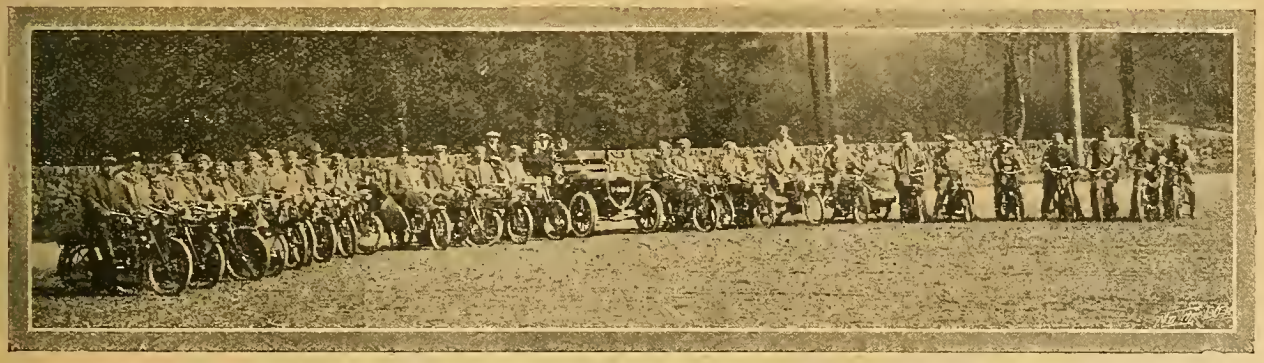
South Birmingham M.C.C.

The results of the members' hill-climb at Wenlock on the 27th ult. are as follows:

SINGLE-CYLINDER CLASS.

		Position on formula
1.	J. Slaughter (3½ L.M.C.)	54.9
2.	A. R. Felton (3½ Zenith)	55.0
3.	L. Bees (3½ L.M.C.)	62.1

LIGHTWEIGHTS.



1.	J. J. Woodgate (2½ Singer)	118.1
2.	V. Busby (2¾ Humber)	118.3

PASSENGER CLASS.

1.	J. Woodhouse (3½ Regal)	103.5
2.	A. R. Felton (3½ Zenith)	107.3
3.	J. J. Woodgate (4 Singer)	133.3

Prizes for novices: L. Poole (3½ B.S.A.) and S. Uptor (3½ Allday and sc.)

There were thirty-eight entries.

A NORTH BRITISH CLUB. Group of members of the Hamilton and District M.C.C. at the start of the opening run to Moffat which was held recently, and mentioned in our last issue (see Club News pages).

Questions & Replies

A selection of questions of general interest received from readers and our replies thereto. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal queries should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

London to Weymouth.

Can yon tell me the road from Cricklewood, N.W. (Gladstone Park), to Weymouth? My chief difficulty is always to get away from London quickly. I have been by Staines, but it takes me a long time to get to that place. Time is the chief object, surface and traffic next. I should be much obliged if you could find a quick route.—T.H.

Your best plan will be to make your way to Willesden Junction, go down Wood Lane to Shepherd's Bush and straight down Hammersmith Broadway, over Hammersmith Bridge, down Castelnau, over Barnes Common, and up Roehampton Lane to Kingston. From Kingston follow the Portsmouth Road to Guildford, and then go *viâ* Farnham, over the Hogs Back, Winchester, Romsey, Ringwood, Wareham, to Weymouth, or Ringwood, Bere Regis, Dorchester, to Weymouth.

When the Exhaust Lifter is Raised.

What happens in the cylinders when the exhaust lifter is raised? I have an 8 h.p. Matchless fitted with a magneto switch, and have had an argument as to whether the mixture does or does not fire with the valves lifted. When freeling down hill or cornering, I close the throttle until the engine just manages to fire, then lift the valves. I quite understand that while the valves are in the act of opening or closing, a weak explosion occurs and possibly burns the valves and seatings a bit if the switch is not on, but the man who argued with me said, "Keep the switch on *all* the time the valves are up." My point is that the mixture does not fire at all with the valves fully raised and the throttle only partly open. I should also like to know what is the proportion of gas and exhaust gas (taken back through the exhaust pipe) when the valves are raised. Of course I know that this will vary with the throttle opening.—J.H.S.

When the exhaust is raised there is, as a rule, no explosion; when the gas does fire, as happens occasionally, you will also get an explosion in the silencer. As there is no compression, the explosion, when it does occur, will be weak and will do no harm. The proportion of gas to exhaust gas will, as you say, vary with the throttle opening; it will also vary with the silencer construction.

Valve Grinding.

(1.) I have a 75 mm. Fafnir engine (3 h.p.) made, I think, about 1905. It runs extremely well, but the spark lever has always to be in a certain position, which is, I think, fully advanced, and if the spark lever is moved the slightest bit it stops firing at once If the plug is taken out it gives an excellent spark at any position of the lever. The ignition is by accumulator and plain coil. Can you give the cause and remedy of this? (2.) Will you please let me know how to grind in a valve, and does the valve-seating also have to be done? What effect does grinding-in have on a valve? (3.) I notice the piston head in my machine has something like $\frac{1}{64}$in. vertical play on the pin which connects it to the connecting rod. Should this be so? (4.) Piston and cylinder get covered with carbon deposit very quickly. Would too frequent oiling cause this?—F.G.

(1.) What you want to do is to overhaul the contact breaker and see if good contact is made in all positions. The contact breaker wants carefully watching, and you must see if at any position there is a poor earth return, or any chance of a short circuit. If spark occurs when plug is removed it does not follow that it will do so under compression. (2.) Full instructions regarding valve grinding are given in "Motor Cycles and How to Manage Them." The effect of grinding in wears down the valve and the seating till they are both a dead fit. It also has the effect of slightly lowering the valve into the seating, and occasionally a little has to be filed off the end of the valve to allow sufficient clearance for the tappet. (3.) The vertical play in the gudgeon pin will have to be seen to soon. You will have to have the connecting rod rebushed. (4.) Excessive lubrication tends to an excess of carbon deposit.

Misfiring at Speed.

I have a 3¼ h.p. Rex with Beehive cylinder, wipe contact, Fuller syntonic coil (new), and Amac 1911 carburetter and a.o.i.v. My trouble is: Engine runs well at low speeds, say up to 15 m.p.h., but over this misses badly, and sometimes stops firing for a few seconds and then goes off again. I have taken down the tank and cleaned it out, overhauled the carburetter, and adjusted the level which is just below the jet. I have had the fibre cam off, trued it up in the lathe, and have rewired all through. The inlet valve opens all right, and the accumulator is fully charged. Good spark at the plug (Sphinx). I use jets Nos. 25 and 32.—W.A.McE.

If the carburetter is the 5 jet type the level should be above the main or controlling jet, so your adjustment would starve the engine at high speed. We should, however, suspect the ignition. (1.) Try the coil with a lighter adjustment, *i.e.*, not screwed down so hard. (2.) Make sure the contact piece in the fibre cam is not loose, and that the blade presses firmly on the ring. There must be no step where the contact joins the fibre or the blade will jump at high speed. (3.) Make sure there is a good earth from the contact breaker. (4.) Inlet spring may be weak, or valve have too great a lift; $\frac{1}{32}$in. to $\frac{5}{32}$in. is plenty.

BRISTOL B. & M.C. HILL-CLIMB AT CLAPTON-IN-GORDANO.
A. P. Maurice (2¼ h.p. Premier) making fast time in Class VIII. for racing singles.

Gears and Horse Power.

(1.) With a standard machine, what speed could be obtained on a level road, and what gear would be required to be used with a 3½ h.p., 5 h.p., and 8 h.p. respectively? (2.) What horse-power would a motor cycle require to be able to do sixty miles per hour on a gradient of 1 in 20 on a calm day? (3.) Is the 3¾ h.p. Premier twin as fast as the single 3½ h.p.? (4.) What is the highest gear that can be used with a clutch satisfactorily.—F.A.S.

(1.) A standard machine will do between 45 and 55 m.p.h. on the level. Gears: 3½ h.p., 4¼ to 1; 5 h.p., 4 to 1; 8 h.p., 3½ to 1 approximately. (2.) The horse-power required for weight-lifting, assuming machine and rider to weigh 350 lbs., would be 2.8, for overcoming tractive resistance 1.5, and wind resistance 5.7. This gives 10 h.p. About 1 h.p. should be allowed for transmission losses. A 6 h.p. twin will produce this power. (3.) About the same. (4.) For starting purposes a low gear is desirable, otherwise the usual gear is suitable.

Low Tension Magneto.

I have an engine off a Singer wheel model motor cycle in nearly new condition, which I am building up into a frame and fitting a pulley for belt drive. I wish to keep the magneto on it, which is of the old rocking armature type. (1.) Can I put it in circuit with a plain coil to make it high tension ignition? If so, how do I wire it up? (2.) I notice that the magneto sparks both on the forward and backward strokes. Should I get two sparks at the plug if a coil is used? If so, how could I prevent it? (3.) Do you think it best to leave the old low tension ignition tappet on as before? If so, where do I connect the small wire coming from the armature? Would it do to fasten it under one of the small screws which hold the cover-plate over the armature in position?—M.W.H.

(1.) We certainly advise you to leave the low tension magneto as it is. The alterations are practically impossible and certainly not worth the trouble and expense. (2.) The two sparks will cause no trouble, as the second spark occurs when it has no effect on the running of the engine. (3.) The only wire from the magneto should be connected to any clean part of the cylinder. It was usually fixed to a screw in the ignition tappet guide.

Inlet Valve Opening.

Having bought a 3½ h.p. a.o.i.v. 80 × 94 mm. Peugeot engine, I should be glad if you would answer the following queries, for, as the engine is small, I should like to get the last ounce of power out of it: (1.) What amount should inlet valve open? (2.) I have three springs for inlet valve: A requires 2¾ lbs. to compress to open valve ⅛in., B 1½ lbs. ditto, C 1¼ lbs. ditto. Which do you think would give the best all-round results, taking into consideration flexibility of running and hill-climbing powers? (3.) Would a mechanically-operated overhead valve (converting the present one to such) be any advantage, and, if so, in what respects? (4.) I have fitted magneto, driving from sprocket on end of exhaust cam. If overhead valve as above is an improvement, how could I operate same? (5.) Supposing the answer to No. 3 to be in the affirmative, when should inlet valve (when converted) open and close, and how much should it open? (6.) I have geared the bicycle about 4½ or 4⅝ to 1; is this about right or not?—E.J.W.

(1.) The inlet valve should lift about $\frac{5}{32}$in. to ¼in. The inlet valve should be just so tight that the valves do not open when shaken fairly violently. (2.) A strong spring is the more efficient, but the weak spring gives better running at slow speeds. You have therefore to seek a compromise. Try B. (3.) A mechanical inlet would probably be an advantage, give better slow running, and need less adjustment. (4.) You will require a separate cam, long tappet rod, and rocker on the cylinder head. (5.) The inlet valve should open about 10° after the induction stroke has commenced, and remain open for 180° of flywheel movement. The opening should be $\frac{3}{16}$in. (6.) The gear is correct.

READER'S REPLY.

Overheating and Worn Exhaust Valve Seating.

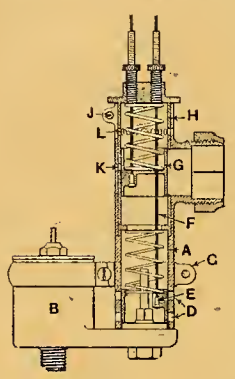
May I trespass on your valuable space to help your correspondent "A.E.H.," who wrote on the 25th ult. regarding his difficulty in diagnosing overheating? The same thing happened to me quite recently. After having fitted smaller jets to my carburetter, and altered its level, and tried various other schemes, I was almost giving up hope of finding the cause of the overheating when I noticed that through continual grinding the seating of the exhaust valve was so deep down that the valve was pocketed and was virtually opening late and closing early, hence the great loss of power and overheating. This defect can be remedied by turning or grinding away the edge of this, pocketing up to the actual seating itself, thereby allowing the exhaust gases to escape until the valve is actually down on the seating.—C. W. KERRIDGE.

EXPERIENCES WANTED.

Readers desirous of obtaining the experiences of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries below should be addressed c/o The Editor.

"W.G.M." (Putney).—5-6 h.p. four-cylinder F.N. Collapsable sidecars.

"P.S." (Levenshulme). — Albion two-speed and free engine hub.



J. Chater Lea, jun. (8 h.p. Chater Lea sidecar), climbing Birdlip Hill in the A.C.U. re-run one day trial. This rider gained a first-class certificate. Birdlip is still regarded as a very severe climb, as evidenced by the crowd which assembled to see the Coventry and Warwickshire M.C. riders climb the hill last Saturday.

Manufacture of Two-piece Valves.

This process of manufacture consists in taking a stem or spindle and dividing its head end into sections; then upsetting, burring, roughening, or otherwise distorting the sections, coating the same with a suitable soldering, brazing, or fluxing material, and casting the valve head therearound.—T. Parker, No. 26,221, 1911.

A Simple Carburetter.

The spray chamber A is secured to the float chamber B by means of the clamp C. The main air intake D is controlled by a piston valve E operated by a Bowden cable F. The throttle valve G is arranged within a ported sleeve H, detachably secured in the chamber B by means of the clip J. When the throttle G is open wide, extra air is admitted through the ports K. Further, when the throttle is lowered beyond the position shown in the drawing, the gas is cut off and pure air is admitted to the engine through the ports L.—J. A. Mackay, No. 9,235, 1911.

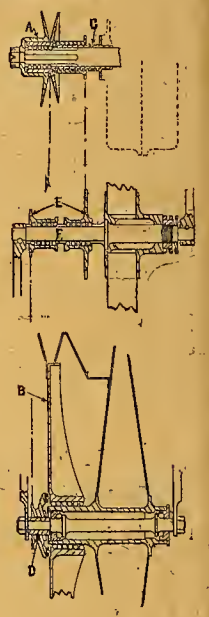
A Non-skid Device.

This non-skid device consists of a leather band A, upon which are mounted plates B,



provided with non-skid studs C, the plates being secured by having their ends bent round the leather strap. The strap A is not wrapped round the tyre and rim as is usually the case, but is arranged sinuously over the cover and held in place by detachable and adjustable wire clips D as shown. The objection to devices of this nature is that the wheels revolve too close to the frame.—W. Haseloff, No. 7,438, 1911.

A Variable Pulley Gear.

In this construction the engine pulley A and the rear pulley B are of the adjustable flange type, being operated by screw thread devices C D. The belt is therefore constantly in alignment. Simultaneous operation of both belts is effected by means of a pair of chain wheels E mounted upon the crank axle F, and connected to the front and rear pulleys respectively by chains, not shown. The pulleys and operating mechanism are arranged so as to always rotate, but yet be free to move laterally upon their shafts.—L. W. Wetherèd, No. 28,559, 1910.

Maintenance of Motor Cars.

The above title is the one selected by Mr. Eric W. Walford for a practical handbook dealing with the upkeep of motor vehicles. The work is not intended so much for skilled mechanics as owner-drivers who do their own adjustments and minor repairs. There are a large number of motor cyclists who are also owners or drivers of cars, and to them this book should be specially useful. The contents include chapters on cleaning, adjustment of the engine, ignition, carburetter, steering, brakes, transmission, and timing. There are also several pages devoted to the fitting and repair of tyre covers and air tubes, and the maintenance of the water-cooling system. The chapter entitled "Diagnosis" mentions practically every possible trouble or fault which is likely to occur, describes the symptoms, and mentions the remedy. In cases where any doubt might arise in connection with the description, a line illustration is appended to render the meaning more distinct. The work comprises 143 pages of clearly printed type and numerous illustrations, and can be obtained from *The Motor Cycle* Offices, 20, Tudor Street, E.C., price 2s. 6d. net.

SCRAPLETS

Gradual Payment System.

The Wincycle Trading Co., Ltd., 106, Great Saffron Hill, E.C., have made a speciality for the last twenty-one years of the gradual payment system in connection with pedal cycles. Needless to say, they have a thorough knowledge of this branch and supply their motor cycles and sidecars on the same terms.

W. Paul Wahl, of Leppavirta, Russia, and his 2¾ h.p. three-speed Hazlewood. Mr. Wahl says his rides at this time of the year are on the ice, which is still over three feet thick. The roads in this part of Russia are not suitable for motor cycling until the middle or end of May.

Catalogues Received.

The Ivy is a machine known to all our readers on which H. C. Newman has scored so many successes. The latest catalogue shows that machines of various powers are supplied, as well as both twin and single-cylinder types.

A speciality is the Newman force feed central air jet which is screwed in place of the ordinary jet in the carburetter. It is said that his partly accounts for the great efficiency of Newman's machine in hill-climbs.

The latest catalogue issued by Bowden Wire, Ltd., Pratt Street, Camden Town, N.W., describes and illustrates the various types of Bowden wire fittings. Our readers will find the hints on fitting Bowden wire mechanism to be extremely useful, as this is a point which is very often not properly understood.

Turco specialities are well-known to motor cyclists. We are in receipt of the latest catalogue published by the Union Rubber Co., of Manchester. This deals with repair outfits, solution, motor cycle tyres of all types and sizes, repair bands, puncture-proof bands for placing inside the cover, tyre gaiters, patches, and rubber clothing.

Ward and Goldstone, Springfield Lane, Salford, Manchester, specialise in electrical fittings and their catalogue naturally deals with the following items of interest to motor cyclists: Charging batteries, ignition coils, dry batteries, volt and ampèremeters, the well-known Voltalite electric lamp, inspection and garage lamps, sparking plugs, terminals, celluloid cement, and othe electrical accessories.

TESTIMONIAL.

30, Upper Sandhurst Road,
Brislington,
BRISTOL.
March 27th, 1912.

Messrs. The Burnett Motor Tyre Co.,
Melksham, Wilts.

Dear Sirs,—It is with much pleasure that I express to you my satisfaction of excellent results I have had from one of your Special 3-ply Motor Cycle Tyres, which I purchased from you in 1910.

I fitted tyre to the rear wheel of my 4½ h.p. single-cylinder motor cycle, sidecar attached, and ran about 3,000 miles without having the least bit of trouble, not even a puncture. I have since removed tyre to wheel of sidecar, and after 1,000 miles is still in excellent condition.

It is also interesting to note that during the time tyre was running on rear wheel of motor cycle, I used no less than three tyres of well-known makes on front wheel, which caused me no little inconvenience.

I may also add that I found tyre excellent as a non-skid during bad weather and far superior to any other make of tyre which I have ever tried.

Yours truly, W. H. WHITE.

A simple quick Puncture Repair

Read this twice. A cursory glance might fail to adequately convey the simplicity of the Parsons Method of puncture repair.

Parsons Rapid Repair Kit mends punctures in one minute. Four simple operations complete the job. 1. Take out damaged part of tube. 2. Punch hole clean. 3. Stretch and insert a plug. 4. Compress—and the repair is made.

Once compressed, the plug can never leak or come adrift; neither can it harm the tyre.

Complete Kit, consisting of piercing tool, stretcher, closing pliers, and 12 plugs weighs 1 lb., measures 7in. x 4in. (fits the pocket) and costs

15/-

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 14 words or less 1/6, and 1d. per word after. Each paragraph is charged separately. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor Street, E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should state distinctly under what heading and in what issue the announcement appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

CLASSIFICATION BY LOCALITY.

For the convenience of purchasers of second-hand motor cycles, the advertisements are classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Plan showing division of England into Sections.

Write for copy of List, or call and see the Kingdom's largest show of Motor Cycle Bargains.

9, SHOE LANE, FLEET STREET, LONDON, E.C.

Wires: "Opificer, London." 'Phone: Holborn, 5777.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. ooo, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

☞DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR BICYCLES FOR SALE.

SECTION I.

Northumberland, Cumberland, Durham, and Westmoreland.

Motor Cycle Taxation.

We hope the Treasury Committee which has been appointed to consider the horse-power rating of motor cycles and motor cars will, when it has arrived at a definite conclusion on this matter, proceed to arrange the taxation of motor cycles on a fairer scale than has been done up to the present. Why should a motor bicycle be taxed one pound per annum irrespective of its weight, age, or value? We do not propose to argue against the tax as a tax, because we recognise that one pound spread over fifty-two weeks is not a large proportion of a motor cyclist's expenses—it is the unfairness of the question which strikes us as requiring some consideration at the hands of those who fix the rates.

First of all, it is totally unjust to tax a motor cycle at all while nothing is paid for saddle horses. Then it is unfair to tax single-track machines, which cause practically no injury to a well-made road, the sum of a pound a year when a small car weighing ten times as much only pays two guineas. The original tax was 15s., the same as a two-wheeled cart, and our argument against it at the time it was imposed was that a two-wheeled cart does infinitely more damage to the road, not to speak of the iron shoes of the horse which draws it, and that while 15s. was considered enough for two wheels on a cart, half this sum was too much in comparison for a motor cycle. Motor cyclists unfortunately are branded with the magic word "motor," signifying wealth to all and sundry, and although the Treasury may think that if a man can afford a motor cycle at all he can easily pay the tax, it must not overlook buyers of second-hand machines who are just able to afford a motor cycle four or five years old costing £10 to £15; at present they have to pay the same tax as the owner of a £50 up-to-date model. We suggest that it would be fair to classify motor cycles for the purpose of taxation as follows: Machines with two wheels, not exceeding 150 lbs. weight, and machines four years old or over, 10s. per annum; exceeding 150 lbs., and under four years old, and all three-wheeled machines, 15s. per annum; four-wheeled cyclecars under 7 cwts., £1 per annum.

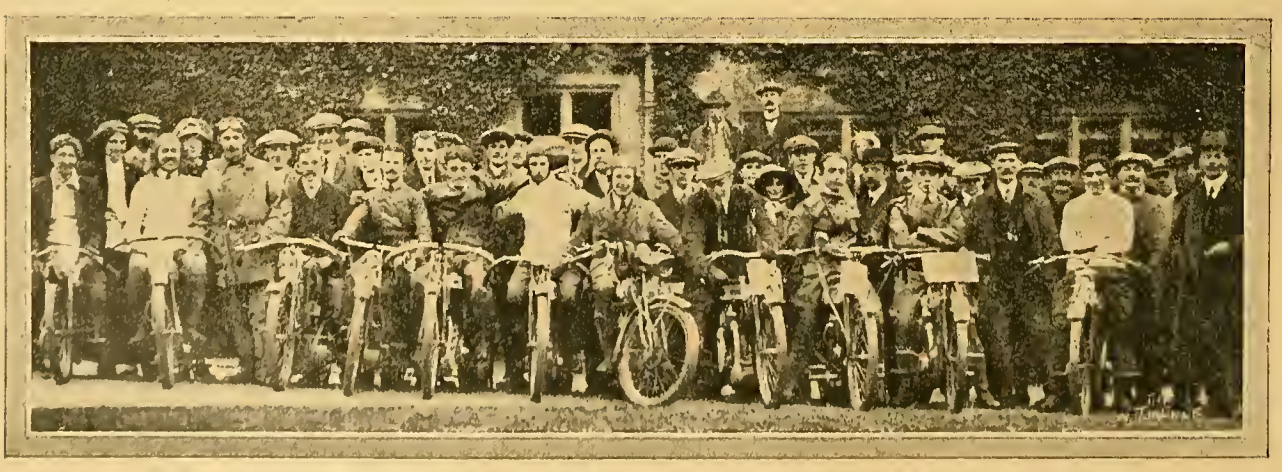
The Weight Definition.

The question of horse-power, size of engine, and other details which are not easy to check or to classify would be all covered by the weight definition. Taxation should certainly be by weight, because damage to roads is done in proportion to the weight of the vehicle. Power and weight also advance together, and it would hardly be possible, at any rate for some time, to produce an abnormally powerful machine inside the weight definition of 150 lbs. Motor cyclists, in addition to the £1 per annum tax, also pay 3d. a gallon on petrol, which at an estimate of 5,000 miles per annum, and reckoning consumption at ninety miles to the gallon, is equivalent to a further payment to the revenue of about 14s. per annum. A driving licence costs 5s. and registration also 5s.

It might be argued that motor cyclists should not agitate for tax reduction because the money collected for taxes is devoted to road maintenance. Were the whole of the taxes so set apart this might apply, but they are not, and as motor cycles do so little damage to roads in comparison with other traffic, there is a strong argument in favour of a lower rate.

In Defence of the Automatic Carburetter.

A FEW years ago someone defined an automatic carburetter as "a mechanical device which gives an incorrect mixture at all speeds," and this definition seems to have become ingrained in the minds of motor cyclists. Nowadays, however, this is quite untrue, and there are several devices which give us at any rate a close approximation to a correct mixture at all speeds. It is usually urged that it is impossible to obtain such a correct mixture with an automatic carburetter as an expert can get with a hand-controlled air supply. In view of certain performances on Brooklands and on the road, the writer is not prepared to admit this. At one time he himself possessed a certain lightweight which was fitted with a very simple automatic device. After slightly tinkering with the standard carburetter better times were made up a test hill than were ever reached with a double-control carburetter. It must be remembered that the average motor-cyclist is not an expert —frequently he is the reverse—and the fewer taps and the less twiddling there is to be done the better he is pleased. It must also be admitted that a novice with a properly adjusted automatic carburetter can do a great deal less damage to his machine than he can (and does) by giving an incorrect mixture because he does not know the "feel" of his air lever, and it is safe to say that a fair percentage of riders never do acquire this "feel." At the present time, with most double-control carburetters, there is a lot of fiddling to be done with the air lever every time that the position of the throttle is altered to any appreciable degree. This is especially annoying when one is opening out on a hill, and a novice will often fail on a hill merely because he could not get his mixture right, whereas if he had had a good automatic carburetter he would have got up with ease. No modern car is turned out without an automatic carburetter, and yet we have to search hard to find a standard British motor cycle so fitted. On the other hand, practically all American machines and most Continental makes, especially lightweights, are fitted with automatic devices which work extremely well. Nearly all the American track records are held by machines so fitted, or having at least semi-automatic carburetters. As regards reliability, there is not much to choose between the two types; if anything, the automatic carburetter has the best of it, as it usually has fewer moving parts to stick.



The reason why we have not progressed further on these lines is simple. The fault does not lie with the manufacturers but with the public. They have been given good double lever control carburetters, and will not risk something which they regard as an innovation. I feel sure that the best makers of double control carburetters are ready and waiting to maintain their reputation with the newer and more scientific type, and will do so as soon as they receive a little encouragement from the public.

History Repeating Itself.

Motor cyclists of long standing will remember the prejudice against the "spray" carburetter in the days when the surface type was in vogue, and yet how many surface carburetters are to be seen on the road to-day? This is a parallel case, and I venture to predict that in a few years the automatic carburetter will take its position as a standard fitting just as the spray type has done. Only those who have experienced traffic riding and touring with the modern automatic can appreciate its advantages, and the way one can throttle down to a tick or pick up suddenly by a simple movement of the thumb, gives one a sense of security never felt with the old method.

It is often stated that an automatic carburetter is wasteful of petrol, but after running with the variable air type for eight years the writer finds that he can obtain just as low consumption under ordinary touring conditions with a well-tuned automatic as with the best two lever type. It was stated recently in these pages that when the extra air port was opened no more air enters the cylinder, and that the opening only weakened the mixture by reducing the pressure, from which I take it that the writer of the article had not come in contact with a certain new carburetter which depends for its mixture on the suction of the engine on the jet chamber, the amount of this suction being mechanically varied as the air ports are opened and shut. As to the temperature and specific gravity of the petrol used, an automatic carburetter is as capable of the slight alterations to air adjustment and the level of spirit in float chamber as any other type

UBIQUE.

Group of Nottingham and District M.C.C. members at the Hardwick Inn after the hill-climb on the 4th inst. (see Club News pages).

AUTO CYCLE UNION NOTES.

The Royal Automobile Club and Associates' Race Meeting.

AT the above event, which will be held at Brooklands on the 27th July, the following two motor cycle races will be held: A two-lap handicap race for all classes of machines, in which a gold medal will be presented to the private owner who finishes first past the post, and an inter-team scratch race. Each team will consist of three riders from a club affiliated to the A.C.U., one of whom shall ride a single-cylinder machine up to 500 c.c., another a multi-cylinder machine up to 750 c.c., and the third a sidecar machine up to 1,000 c.c. The team gaining the least points is to be adjudged the winner. These two races were most successful last year.

Permits.

Subject to the competing machines being geared 5—1 with 26in. wheels, a permit has been granted to hold motor cycle races at the Cambridge Charity Sports on the 24th July. Permits have been granted to the Cardiff Motor Club to hold an open hill-climb and speed trials on the 20th July, and to the Cumberland M.C.C. to hold speed trials on the 5th August. A permit will be given to the Bradford M.C.C. to hold an open reliability trial on the 27th and 28th May provided compliance is made with the A.C.U. regulations governing those trials.

Private Owners.

Owing to certain circumstances which have arisen, it is necessary to point out that private owners taking part in competitions must only ride machines which are actually their own property. They must not pose as private owners when riding borrowed machines.

The Edinburgh Motor Cycle Club's Inter-team Hill-climb.

The above event will be held on Manor Hill, near Peebles, twenty miles south of Edinburgh, on Saturday, June 8th, starting at 2.30 p.m. It is proposed that the team shall be made up as follows: Four riders of machines over 500 c.c., six riders of machines up to 500 c.c., and two riders of sidecar machines up to 1,000 c.c. The last two may be chosen from the above ten. There will be two classes, a scratch class and a handicap class. The team event will be followed by an open hill-climb. Tourist Trophy types of motor bicycles will be admitted, provided they are fitted with spring forks, full-size mudguards, tyres, etc. We understand that the hill is fairly short, very steep, and quite safe. English riders desirous of representing their country in this event should forward their names to the secretary of the A.C.U., together with particulars of their machine.
